No, in small numbers. I've seen—at some of the national meetings I've attended—maybe one person a year who'll present some hematological cases that include some people with hemophilia. I haven't had such a case, though. I have had people who've had normal blood clotting, who had a tooth pulled, experienced excessive bleeding and I've been able to stop it, usually within minutes. The dentists do it quite often.

Is this something that's done in the person's home or in your office or the hospital or anywhere?

Anywhere.

Methodology

HOW is it done? With a watch, as it's shown in the movies and on TV?

Years ago, you used watches, light and other moving objects. Presently, the most common form of hypnotic induction is a verbal or eye-fixation induction—just fixing the eye on some particular object. It gives a point of fixation as a beginning point for the induction of hypnosis, but we don't have any flashing lights—nothing like that. I can do it here in the office and in any of the exam rooms. When I have a patient in the hospital, I do it with the patient in the hospital bed, without interfering with the person in the next bed.

How long does it generally take you to put somebody under—if I'm using the correct terminology?

Less than 10 minutes. The older, previous hypnotists took quite a long time to get a person into a hypnotic trance, averaging three-eight hours.

What changed?

Improved techniques, a lot of experimentation and physicians reviewing each other's work. They got it down to one hour to a half-hour to 15 minutes; now, we can do it in anywhere between 3-10 minutes, easily. There're some patients who take longer, though.

Is it still the stereotypical thing wherein the hypnotist coos soothingly, "You're getting weary. Your eyelids are very heavy," etc.?

You can do it that way, but there're a number of other techniques of induction that aren't so stereotyped, and, in my practice, I use a lot of these other techniques of induction, simply because they're not stereotyped.

How many hypnotic trances do you perform in, say, a year—50? 10?

In one week, I might do two; next week, I might do 15.

Medical Problems Treated

What kinds of illnesses or conditions

can hypnosis be used in treating? We've already talked about hemophilia, for instance.

Hypnosis is most commonly-used in an office setting for anxiety and depressive reactions.

Can you talk somebody OUT of being anxious and depressed?

Yes. I can't say that they actually forget, but what they do is vary their response pattern, and I think that's what hypnosis does most.

Put that into simpler terms for me. Do you mean how they handle their problem?

Yes.

OK. So it gives them more tools with which to handle it?

Yes.

All right. Let's say someone doesn't have enough money to pay due bills. How would you handle the anxiety felt by that person?

Medical hypnosis isn't particularly useful for something like that.

How about a marital break-up, or alcoholism? Guilt feelings?

There's a number of different ways of approaching it. If your decision is to use a hypnotic trance for the approach, then you can approach it by what we call direct suggestion, and that's not necessarily the best. Direct suggestion means that you just suggest that, whatever the feeling or occurrence is, it goes away.

There're projective techniques wherein you can put a person into a trance and then suggest that they visualize things as if there were a play in front of their eyes on a stage. They can project themselves into one of the characters, and then make the character do something useful for that symptom. That person then accepts that suggestion as if it were their own.

Another technique which is particularly useful for chronic pain is to put a person into a hypnotic trance and then do a desensitization technique; that is, desensitize them so that the pain will be a little less at a certain point in time—a little less and a little less, as time goes on. Also, you can give them cues to assist the pain in diminishing or going away completely.

Is pain actually in the MIND and NOT in the physical body?

It's in both. Pain is physical, but the response pattern can be varied by the mind.

Can you talk someone OUT of having a heart attack?

No.

Can you make a person less nervous or tense whereby they'd be less susceptible to a heart attack?

Yes, but hypnosis cannot change organic symptoms at all.

Can it ARREST them to a degree?

If a person has appendicitis, you can ease their pain, but you can't stop their

appendicitis. They still have to be operated on for that appendix.

And the same would be true, then of the hemophilia we spoke of earlier? You could arrest the pain somewhat, but still have to deal with the condition in traditional medical modes.

Yes, that's correct.

The Hypnosis Decision-Making Process

Earlier, you mentioned a decision to use hypnosis in treatment. When do you make that decision, and what factors go into it?

In your medical practice, you learn right from the beginning to use different parameters of management of a patient. Hypnosis—like penicillin—is just one of those parameters. If I have a patient in my office who has a problem wherein hypnosis would be a useful parameter, and that person is responsive to hypnosis, then I'll use it.

How do you know—BEFORE using hypnosis—if a person is responsive or not? Can you tell BEFORE putting him or her under?

Yes. There're a lot of cues that we have. In fact, I use those cues to let me know whether or not it'll be worthless just to try it with a particular individual at this particular point in time.

What ARE some of the cues?

They're mainly responses to suggestion. If a person responds well to suggestion, then—usually—he or she will respond well to hypnosis.

How can you determine that BEFOREHAND, though, and, do you object to my terminology of "putting them under?"

I prefer saying "putting them in a hypnotic trance." There're a number of tests of hypnotizability that've been developed, and these can be used in both individual and group settings. Some of us use these tests to make our determination, but, also, one of the best ways is simply to put them into a hypnotic trance itself.

So, in essence, you have to DO it to see if you CAN do it?

But not completely, because there are some parameters that'll give you a pretty good idea—at somewhere about 80% accuracy.

Give me some examples, please, of some identifiable cues, parameters or indications. I think we're "shadow boxing" AROUND them, and I'm trying to get TO them—whatever they are.

When I said "An individual's response to suggestion," what I'm saying to myself is that, if I can ask a person to take a nice, deep breath, and that individual so responds, that is a good response to that suggestion. If the person's hesitant in that response, then he or she is not a good responder at that point in time to that suggestion.

At that point, is the person IN the trance?

No.

He or she is completely cognizant of what's going on?

Yes.

So, if I walked in right now off the street as your patient, we were sitting here talking and you were trying to sound me out, and you said, "Take a deep breath" and I did it without hesitation, THAT would be a step toward the possibility of my being put in a trance?

That's right.

If I didn't do it at all—and looked like an obstinate person—you WOULDNT do it?

Right. Now suppose I did this (at this point, Dr. Hunt stretched out his right hand toward me, and I shook it.—BT.) Your response was to do the same thing, so you are responsive to suggestion. If you had an individual who looked at you and did not respond, then you'd say to yourself "At this time, this person isn't responsive to suggestion." You then have two choices: either **don't** use suggestive techniques or allow the person to communicate with you better until he or she learns what you want them to do.

Another response to suggestion is, for instance, when you come into the doctor's office, you automatically **know** the doctor is going to take your pulse. What I can do is ask you "What is your response to that suggestion?" (As he said this, Dr. Hunt took my right arm and placed it in the air, where he left it suspended as he talked.—BT.)

That you're going to take my pulse?

No. Your response to that suggestion was that your arm stayed **exactly** where I left it! You see? Already, I've given you two tests! Another test that we use at present is what we call an "eye-roll" test. A person can look up and close their eyes and, characteristically, individuals will have a certain amount of the scleral or white part of their eyes visible as they close them, and it varies with individuals. We've found that the individuals who have **more** of the sclera visible as they do that eye-closure seem to be more responsive. We use other factors to go along with that, but if I have an individual who has a very good response to that test, I know that I can say to them, "Look, when we go into the operating room, we'll be able to use hypnosis for your operation," or for whatever it is.

Hypnosis and Surgery

How come you—as a surgeon—are into this? You're not a psychologist or psychiatrist. It would seem to me that hypnosis would fall much more into mental treatment, as opposed to something done with the surgeon's knife.

That's why—up to this time—so very few surgeons have been interested in it. Another reason is because of the old impression that it took so long to get a person into a trance, as I mentioned before. They feel they'll be wasting their time, and I felt that way at the beginning, too.

How do you use hypnosis in the operating room? Is it **IN PLACE** of anesthetics for pain or **IN ADDITION** to them?

Both.

All right. Give me an example of each—and then combine them. How would it be used in place of an anesthetic?

The one that would be the most outstanding example would be in the event that the patient needed an operative procedure and had had a previous poor response to anesthetics.

How many people reject anesthetics?

Less than 1%.

Does hypnosis help these people?

Yes, provided they're responsive to suggestion.

Hypnosis and "Faith Healing"

You may resent my analogy but, in a way, what you're saying seems to resemble "faith healing" which, as you know, is used for religious purposes.

Yes.

Do the faith healing ministers use a form of hypnosis or hypnotism in their public mass sessions?

They use similar suggestive techniques, and the individuals can go into a trance, but when we say "hypnotize people," what we're thinking of is making a defined beginning and ending point of the hypnotic trance. Most of those faith healers use suggestive techniques to the point where people go into their own trances, and, yet, they don't specifically know how to identify these beginning and ending points.

In other words, to get in and to get out of them?

Right.

Self-Hypnosis

Can people hypnotize themselves?

People always hypnotize themselves! I don't hypnotize **anybody**. What I do, essentially, is give them the cues to use their own capacity to go into their own trance.

Can they do it **WITHOUT** a second party?

Yes.

Have people known how to do it—and done it?

Yes.

Do they generally get out of it—or do they leave themselves in it and you find them a week later sitting somewhere in a trance?

You can time yourself almost exactly. I teach my students that they can go into their trance, tell themselves in advance that it's going to be two minutes and—usually somewhere around two minutes and 15 seconds—they'll come right out.

Where do you have your students?

At the national meetings and locally, too. Dr. Thurmond Mott has both beginning and advanced classes at the University of Maryland, and some of us assist him with those.

At what point in a doctor's training does he or she take these classes? In medical school?

Yes. During the junior year of medical school.

Does **EVERYBODY** get this training now?

No. Only selected people.

But everybody **COULD** if they wanted to?

Yes. It's in the curriculum of a number of medical schools now.

What is the name of the course?

Basic Medical Hypnosis.

How many hypnotists are now in Baltimore?

There's about 15 whom I know of from the national societies I mentioned earlier. With the classes, it would almost double that number if you get some of the students into the societies.

Dr. Hunt's Work

How would you rank yourself within those 15: an expert, lower or better than the others, or on par with them?

I am the best, non-psychiatric hypnotist in this area, and I can pretty much assure myself that I'm correct in that view. I **don't** do psychiatry at all, though. If I have a problem that appears to be psychiatric, and if I think hypnosis would be good for it, I send the patient to somebody like Dr. Mott, who is a psychiatrist.

OK. What kinds of surgical conditions CAN you treat with medical hypnosis?

The whole range of things! We've treated everything from sprains to lacerations to tumors.

WHY do you use hypnosis in a surgical setting—to control pain?

In surgery, if you use it for something like a sprain or a broken bone, you're using it for pain control, but if you're using it for a laceration, that's anesthesia. You can also use it for pain control in malignancies, where patients have chronic pain. As for surgical techniques, you can do operations inside the abdomen, take out the appendix, do intestinal or stomach operations, gallbladders, thyroid conditions, etc.

I've been very careful—and this is one of the reasons some people haven't heard of me—in trying to assure myself and others that this doesn't become just a stage procedure, as I related earlier, and when I use hypnosis in a hospital, I try not to let the people in the hospital or operating room feel that we're doing anything **different**. In the hospital, I request and advise my anesthetist in advance. If it's the proper procedure, the anesthetist is on stand-by. If the anesthetist wants to participate in any way, he or she may. When I use it in the operating room therefore, there's no "show" if at all possible.

Do you do it prior to the patient being wheeled into the operating room?

The hypnotic trance is fascinating in that, if a person can go into a hypnotic trance **once**—and he or she knows how to do it—they can get into it **anytime**. All I have to do is give them a cue to repeat their previous session, so, if I'm using it in the operating room and have hypnotized that person previously, all we—the patient and I—have to do is use the cue we've set up. I've put all of my children into a trance, because once a person has done it, as I said, he or she can do it. I'm fairly confident that, if my son breaks a leg, I can put him right back into a trance so that he can be comfortable while his leg is being set, but that's as far as I've gone with it in my family.

Can the cue of which you were speaking be only one word?

Yes, like "apple." On the other hand, if it's the first time—and we just happen to be in the operating room at the time—the suggestions that I give to induce a trance are similar to the suggestions the anesthesiologist would give anyway, if the anesthesiologist is knowledgeable in suggestive techniques. When I've used it in the operating room, very seldom have we put it on the operative schedule, as hypnosis or anesthesia or maybe we've put it on the schedule as anesthesia stand-by for local anesthesia, and just let the individuals who're in the operating room at the time know that we're using it. I've used it at Lutheran, Union Memorial, Maryland General and Provident Hospitals in Baltimore for surgery.

If you put a patient in a trance in an operating room, would it be possible for you to look up from the table and see everyone ELSE in the room, aside from yourself, ALSO in trances?

No. That doesn't happen.

Hypnosis and Behavior

Is it true—as one often sees in the movies and on TV—that the person hypnotized is completely in the power of the hypnotist, and can be made to jump out of a window, kill somebody or whatever?

A person who is in a hypnotic trance will not do anything that he or she couldn't do **OUTSIDE** of it.

So, if they murdered someone while in a trance, it really means they had murdered them to begin with?

That's correct.

And, conversely, if not, you can't FORCE a person to murder?

That's correct.

Mass Suggestion

I don't know if you've even seen films of the "Beatlemania" craze of the mid-1960s, which I've always felt was somewhat similar to the Elvis Presley fever of the 1950s.

Yes, I'm aware of these things.

IS there such a thing as a mass of people being hypnotized as a group by someone like Mike Jagger of the Rolling Stones?

That would really be mass suggestion, like TV advertisements, but I like to limit hypnosis to something, again, that has definite beginning and ending parameters.

With mass suggestion, what you're doing is inviting individuals to go into their **own** trance. The period of time isn't begun strictly by your starting point in time, but by the point in time in which they—the masses—have developed their trance.

Sirhan a "Manchurian Candidate?"

In the book and, later, movie, entitled THE MANCHURIAN CANDIDATE, a fictional person is programmed to commit several acts of murder.

That's correct.

Many people feel that this, indeed, is what DID happen in the case of Sirhan Sirhan, the man who assassinated Senator Robert F. Kennedy in 1968. Do you think that that's at all possible?

Yes, I do think it's possible.

OK, but how do you juxtapose THAT feeling with your earlier-stated belief that a person WON'T do it unless it's within him or her to begin with? WAS Sirhan ALREADY a latent murderer? To anyone's knowledge, he'd never killed anyone before.

In order to do that, you had to use a technique that's not within the realm of medical hypnosis, and those techniques—although they're highly-developed—and do use some suggestion, are **outside** the realm.

From what you've read of the Sirhan case, do you think he was hypnotized by someone? Throughout his diary—which was later found by the Los Angeles Police—Sirhan had written "RFK must die. Robert F. Kennedy must die," and on and on, time after time.

The answer to that would be no.

Why not?

Because that is a type of brain-washing that's included in the various sects where they use things such as mind-deprivation, physical-deprivation, torture, etc. Mind-deprivation is where you take an individual and either force him to stay in a position where he has limited sensory input and then you add to that an input that you want, such as a constant chant—and that's definitely outside the realm of medical hypnosis.

Hypnosis in Criminology?

Do you think a criminal's pattern of behavior can be changed through hypnosis?

Yes.

You could stop a murderer from murdering?

No.

Why not?

I said I could change his or her pattern of behavior, but if a situation occurred

in the future and they wanted to commit murder, that wouldn't stop them.

But it might PREVENT them?

Yes.

Another Role for Dr. Hunt

Let's talk about your work as Chief Physician of the Baltimore City Fire Department. What does a Fire Department physician do?

There're eight of us. We do two things: 1) take care of the minor illnesses of Fire Department personnel in an infirmary situation and 2) supply medical expertise at the scene of a fire. There's 2,200 personnel to care for.

Do you give them their preemployment physical exams?

No. That's done through the Civil Service.

Do you have regular hours of duty or are you on-call?

We have infirmary hours daily and a physician is also on-call each day. The infirmary is located at 1100 Hillen Rd. in Baltimore in the Oldtown Fire Station.

How did you get involved in this work?

I treated a fireman for about a year for a severe burn—over 87% of his body—and, the next time an opening came in the Department, I applied for it and was accepted. Incidentally, with the burnt fireman, I used hypnosis for pain control, and it worked beautifully—particularly with his dressing changes—and it also allowed us to reduce his dosage of medication. When his period of depression occurred, we used it again. It was a pleasure to work with him, but was mainly a learning experience for me.

He credited you with saving his life both physically and mentally, didn't he?

Yes.

Thank you, Dr. Hunt.

Acknowledgements

The author thanks Mrs. Mildred Chronister for secretarial services, as well as Dr. Hunt's able, cheerful and helpful secretaries, Ms. Katie Grove and Ms. Truemenda Mobley. □

Meckel's Diverticulum: A Five-Year Study of 58 Cases at St. Joseph Hospital

By HON. K. POON, MD

For reprint and other data, contact Dr. Poon at Apt # 102, 27 Shawnee Ct., Balto., MD 21234.

Introduction

Meckel's diverticulum, an embryonic remnant of the partially-unobliterated omphalomesenteric duct which bears the name of Meckel who described it in 1812¹ was actually first mentioned in the literature by Hildanus² as early as 1598. Though in itself not a common entity, the accepted overall incidence in the general population being around 2% as estimated in the works of many investigators,³⁻⁶ it is by far the commonest of all congenital gastrointestinal anomalies.⁷

The fact that it can present from its symptomatic group where it appears in the form of various intraabdominal diseases to its asymptomatic counterpart only to be found during laparotomy for other unrelated causes or during autopsy makes it a frequently-discussed topic in the literature. The following is a retrospective study of 58 cases in St. Joseph Hospital in Baltimore during the period of July, 1970-June, 1975.

Observation

During the five year period from July 1, 1970-June 30, 1975, a total of 58 cases of proven Meckel's diverticulum was recorded. All these cases were encountered either during laparotomy for various causes including symptomatic Meckel's diverticulum or during autopsy and all has histological diagnosis compatible with the anomaly.

Incidence

Among the 58 cases described, 44 were incidental in which the patients were asymptomatic, whereas 14 others were symptomatic. Among the 44 incidental cases, 35 were found during laparotomies for unrelated causes and nine were found during autopsy. All these nine patients died from other disorders unrelated to the Meckel's diverticuli. In the period of time studied, the total number of laparotomy done was 8,015 (All laparotomies including gynecological except C-sections.) Among all these laparotomies Meckel's diverticuli was found in 49 cases, 35 of which were "normal," while the rest (14) were diseased (Table 1.) A summary of the distribution of the total 58 cases is presented in Figure 1.

Age and Sex Distribution

The 58 cases of Meckel's diverticulum included 35 males and 23 females. The youngest case was found in a seven-month-

old baby girl who had massive rectal bleeding from the diverticulum. The oldest patient was found during an autopsy in a 82-year-old man who died of acute myocardial infarction; however, the oldest diseased diverticulum was found in a 60-year-old woman who presented with rectal bleeding. In this series, the peak incidence was found in the third and fourth decade; however this includes both diseased and incidental cases. A close to 3:2 male: female ratio is noted. (Fig. 2) Furthermore, 57 cases recorded were Caucasians. Only one out of the total 58 was black.

Clinical Presentation

Of the 14 symptomatic cases, the most

common presentation was rectal bleeding. Next came obstruction, inflammatory processes and perforation in descending order (Table 2). Among the nine patients who presented with rectal bleeding, a preoperative diagnosis of Meckel's diverticulum was made only in two, one by 99m-Tc pertechnetate scan and the other by small bowel series. The diagnoses of the remaining seven were "GI bleeding from unknown origin." On operation, all were found to have bleeding Meckel's diverticuli. Among the four patients presented as intestinal obstruction, one was found to have an intussusception of the ileum which the Meckel's diverticulum served as a leading point. In the second, the patient had the Meckel's diverticulum existing

into a femoral hernia sac with a loop of ileum. One case presented as acute appendicitis and was found on exploration to have a perforated Meckel's diverticulum with diverticulitis. The appendix was normal. A summary of the preoperative diagnoses on the 14 symptomatic cases is presented in Table 3. Also, the age and sex distribution of these 14 cases is shown in Fig. 3.

Pathology

Of the 58 cases described, the histologic findings of the Meckel's diverticuli were recorded in only 50, among which gastric mucosa was found in 10. Four of these were associated with rectal bleeding. Again, among the 10 cases, two contained both heterotopic, gastric and pancreatic tissues, one of which was associated with bleeding. The location of the Meckel's diverticuli was recorded in only 26 of the total 58 patients, the furthest one from the ileocecal valve being 100cm. and the nearest one 3.8cm. The majority were within the 30-60cm. range. As for the size of the Meckel's diverticuli, the largest was 9cm. in length and 3cm. in average diameter, whereas the smallest was 1.3cm. in length and 0.5cm. in average diameter. The rest of the pathological findings was detailed in the previous paragraphs.

Discussion

Meckel's diverticulum, despite the fact that it is neither a rare nor frequent anomaly, still enjoys certain popularity in the past and current medical literatures because of its many interesting features. Numerous reports and case studies have been published. In the present series, although some of the statistics reported do not correlate well with the currently-accepted figures, since this is not a randomized prospective investigation and represents only a particular community studied, the major emphasis of this paper is to the various presentations of the diseased Meckel's diverticulum to which the surgeon should pay particular attention in the differential diagnosis of acute abdominal catastrophes.

Embryologically, Meckel's diverticulum represent the remnant of the unobliterated omphalomesenteric or vitelline duct. During the first few weeks of fetal life, the primitive yolk sac is divided into two portions connected by a tube contained in a structure which in later stages becomes the umbilical cord. The outer portion of the divided primitive yolk sac is referred to as the yolk sac, while the inner portion develops into the midgut. The tube which connects these two portions is the omphalomesenteric duct which, in normal development, becomes obliterated around the seventh week of fetal life. Total or partial failure of obliteration results in the presence of Meckel's diverticulum and its allied anomalies. Total failure of obliteration gives rise to a persistant omphalomesenteric duct with umbilical fistula. Partial

a partially-obliterated, omphalomesenteric duct with distal fibrous band formation around which torsion and volvulus of the ileum occurred. In a third, the obstruction was found to be caused by segments of

diverticulum. A polypoid lipoma was also found in the lumen of the ileum, however, no inflammatory process was found. In a fourth case, the patient was found to have a Meckel's diverticulum incarcerated

failure of closure on the mesenteric or intestinal side results in Meckel's diverticulum with or without fibrous connection to the umbilicus while partial patency on the umbilical side results in umbilical sinus.⁸ Schwartz has estimated the incidence of Meckel's diverticulum along the anti-mesenteric border of the ileum to be 82.5%, partial obliteration with distal band 10% and persistent vitelline duct with umbilical fistula 6.5%.⁷ among all vitelline duct anomalies.

As generally-accepted, the incidence of Meckel's diverticulum is around 2% of the population. In the total 58 cases reviewed, the lesion is the cause of clinical disease in 14 cases which makes up to 24.1%, a figure consistent with the range of 15-25% in numerous similar studies.^{1, 9-11}

This means that one out of every 50 persons in the general population has a Meckel's diverticulum and that one out of every 200 persons has a Meckel's diverticulum which would give rise to clinical disease. The clinically-symptomatic entities usually become manifested in childhood. It is reported that about half

of these patients are seen before the age of two;^{6, 12-13} however, the present series is not consistent with these figures in that only two of the 14 symptomatic cases were two years old or under and six of the 14 were seen before the age of 20. A comparison of reported incidences in various series is presented in Table 4.

The most frequent presentation of a symptomatic Meckel's diverticulum is rectal bleeding. This is followed by intestinal obstruction and inflammation with or without perforation in descending order. Such findings are consistent in various studies. In Maguid's (et al) series of 60 patients, 32 had profuse rectal bleeding, amongst which 19 had peptic ulceration, 19 presented as intestinal obstruction and nine with perforation and peritonitis.¹⁴ In Rutherford and Aker's series of 80 diseased diverticuli, 43 had rectal bleeding, 26 intestinal obstruction, eight primary diverticulitis and three with perforation.¹³ The present series also demonstrated similar findings. Besides the usual pictures, particularly-rare presentations have been recorded. Martinez and Silbiger reported two unusual cases in

which one Meckel's diverticulum contained a calculus presenting as a triangular calcification in the RLQ of the abdomen in a nine-year-old boy and, in another case, the Meckel's diverticulum was a leading point of a ileocolic intussusception in a 11-month-old female.¹⁵

Many other reports also demonstrated presence of enteroliths in the Meckel's diverticulum.¹⁶⁻¹⁹ In 1947, Moses reported a first case of peptic ulcer developed in a Meckel's diverticulum which has bled into the peritoneal cavity and the patient presented with shock and evidence of pneumoperitoneum.²⁰

The preoperative diagnosis of symptomatic Meckel's diverticulum is frequently based on clinical manifestation alone or by exclusion. Although roentgenographic techniques including intraluminal contrast or angiographic studies have been successfully-used to demonstrate the Meckel's diverticuli, their overall accuracy have always been disappointing.²¹ Thus, in the majority of cases, the diagnoses are confirmed only on laparotomy; however, a convenient, non-invasive method of fairly-satisfactory accuracy has been suggested and repeatedly reported in recent years. This includes an abdominal scan with ^{99m}Tc-pertechnetate. In 1970, Jewett et al reported two successful demonstrations of Meckel's diverticuli by Tc scan.²² At the same time and thereafter, numerous authors have reported satisfactory results. The positive scan is based on the active uptake and secretion of the pertechnetate ion by gastric mucosa (ectopic in the Meckel's diverticulum). Since more than half of the symptomatic Meckel's diverticuli contain such heterotopia, the yield is naturally high.⁵ According to Berquist et al, the diagnostic accuracy is particularly-high (approaching 100%) when the symptoms are caused by hemorrhage.¹² On the other hand, reports of false (+) and (-) are not infrequent.²³⁻²⁴ In these studies, hematoma in the wall of the intestine, peptic ulceration of small intestine, partial obstruction of the ureter resulting in accumulation of isotope proximal to the site of obstruction, hydropelvis with collection of isotope in the dependent part of the renal pelvis and aneurysms of the abdominal vessels have all been blamed on the causes of the false positives.²⁵

As universally-known, heterotopic gastric, pancreatic and duodenal mucosa (tissue) are commonly-seen in histopathologic studies of resected Meckel's diverticuli, especially those which provided symptoms. Griffin has stated that 50% of patients with Meckel's diverticulum have heterotopic tissues.⁸ Rare pathological findings, such as sarcoma arising in the Meckel's diverticulum, have also been reported in the literature.²⁰ While surgical removal of the diseased Meckel's diverticuli is mandatory, the prophylactic removal of the diverticuli found incidentally is also indicated when feasible.

Summary

A retrospective clinico-pathologica

study of 58 cases encountered during the five-year period of July, 1970-June, 1975 in Baltimore's St. Joseph Hospital is presented. A major emphasis is laid on the clinical presentations: 44 of the total 58 cases reviewed were asymptomatic, encountered only during laparotomy for unrelated causes or during autopsy; however, when diseased, these previously-silent and apparently-innocent diverticuli can lead to abdominal catastrophies. The most frequent presentation is massive rectal bleeding.

A reminder

ZYLOPRIM[®]

(allopurinol)

100 and 300 mg scored Tablets

- inhibits uric acid formation
- helps prevent urate crystal depositions in synovia
- reduces risk of uric acid lithiasis

INDICATIONS AND USE: This is not an innocuous drug and strict attention should be given to the indications for its use. Pending further investigation, its use in other hyperuricemic states is not indicated at this time.

Zyloprim[®] (allopurinol) is intended for:

1. treatment of gout, either primary, or secondary to the hyperuricemia associated with blood dyscrasias and their therapy;
2. treatment of primary or secondary uric acid nephropathy, with or without accompanying symptoms of gout;
3. treatment of patients with recurrent uric acid stone formation;
4. prophylactic treatment to prevent tissue urate deposition, renal calculi, or uric acid nephropathy in patients with leukemias, lymphomas and malignancies who are receiving cancer chemotherapy with its resultant elevating effect on serum uric acid levels.

CONTRAINDICATIONS: Use in children with the exception of those with hyperuricemia secondary to malignancy. The drug should not be employed in nursing mothers.

Patients who have developed a severe reaction to Zyloprim should not be restarted on the drug.

WARNINGS: ZYLOPRIM SHOULD BE DISCONTINUED AT THE FIRST APPEARANCE OF SKIN RASH OR ANY SIGN OF ADVERSE REACTION. In some instances a skin rash may be followed by more severe hypersensitivity reactions such as exfoliative, urticarial and purpuric lesions as well as Stevens-Johnson syndrome (erythema multiforme) and very rarely a generalized vasculitis which may lead to irreversible hepatotoxicity and death.

A few cases of reversible clinical hepatotoxicity have been noted and in some patients asymptomatic rises in serum alkaline phosphatase or serum transaminase have been observed. Accordingly, periodic liver function tests should be performed during the early stages of therapy, particularly in patients with pre-existing liver disease. Patients should be alerted to the need for due precautions when engaging in activities where alertness is mandatory.

Nevertheless, iron salts should not be given simultaneously with Zyloprim. This drug should not be administered to immediate relatives of patients with idiopathic hemochromatosis.

In patients receiving Purlinethol[®] (mercapto-purine) or Imuran[®] (azathioprine), the concomitant administration of 300-600 mg of Zyloprim per day will require a reduction in dose to approximately one-third to one-fourth of the usual dose of mercaptopurine or azathioprine. Subsequent adjustment of doses of Purlinethol or Imuran should be made on the basis of therapeutic response and any toxic effects.

Usage in Pregnancy and Women of Childbearing Age: Zyloprim[®] (allopurinol) should be used in pregnant women or women of childbearing age only if the potential benefits to the patient are weighed against the possible risk to the fetus.

PRECAUTIONS: Some investigators have reported an increase in acute attacks of gout during the early stages of allopurinol administration, even when normal or sub-normal serum uric acid levels have been attained.

It has been reported that allopurinol prolongs the half-life of the anticoagulant, dicumarol. This interaction should be kept in mind when allopurinol is given to patients already on anticoagulant therapy, and the coagulation time should be reassessed.

A fluid intake sufficient to yield a daily urinary output of at least 2 liters and the maintenance of a neutral or, preferably, slightly alkaline urine are desirable to (1) avoid the theoretic possibility of formation of xanthine calculi under the influence of Zyloprim therapy and (2) help prevent renal precipitation of urates in patients receiving concomitant uricosuric agents.

Patients with impaired renal function require less drug and should be carefully observed during the early stages of Zyloprim administration and the drug withdrawn if increased abnormalities in renal function appear.

In patients with severely impaired renal function, or decreased urate clearance, the half-life of oxipurinol in the plasma is greatly prolonged. Therefore, a dose of 100 mg per day or 300 mg twice a week, or perhaps less, may be sufficient to maintain adequate xanthine oxidase inhibition to reduce serum urate levels. Such patients should be treated with the lowest effective dose, in order to minimize side effects.

Mild reticulocytosis has appeared in some patients.

As with all new agents, periodic determination of liver and kidney function and complete blood counts should be performed especially during the first few months of therapy.

ADVERSE REACTIONS:

Dermatologic: Because in some instances skin rash has been followed by severe hypersensitivity reactions, it is recommended that therapy be discontinued at the first sign of rash or other adverse reaction (see WARNINGS). Skin rash, usually maculopapular, is the adverse reaction most commonly reported. Exfoliative, urticarial and purpuric lesions, Stevens-Johnson syndrome (erythema multiforme) and toxic epidermal necrolysis have also been reported. A few cases of alopecia with and without accompanying dermatitis have been reported.

In some patients with a rash, restarting Zyloprim (allopurinol) therapy at lower doses has been accomplished without untoward incident.

Gastrointestinal: Nausea, vomiting, diarrhea, and intermittent abdominal pain have been reported.

Vascular: There have been rare instances of a generalized hypersensitivity vasculitis or necrotizing angitis which have led to irreversible hepatotoxicity and death.

Hematopoietic: Agranulocytosis, anemia, aplastic anemia, bone marrow depression, leukopenia, pancytopenia and thrombocytopenia have been reported in patients, most of whom received concomitant drugs with potential for causing these reactions. Zyloprim[®] (allopurinol) has been neither implicated nor excluded as a cause of these reactions.

Neurologic: There have been a few reports of peripheral neuritis occurring while patients were taking Zyloprim. Drowsiness has also been reported in a few patients.

Ophthalmic: There have been a few reports of cataracts found in patients receiving Zyloprim. It is not known if the cataracts predated the Zyloprim therapy. "Toxic" cataracts were reported in one patient who also received an anti-inflammatory agent; again, the time of onset is unknown. In a group of patients followed by Gutman and Yü for up to five years on Zyloprim therapy, no evidence of ophthalmologic effect attributable to Zyloprim was reported.

Drug Idiosyncrasy: Symptoms suggestive of drug idiosyncrasy have been reported in a few patients. This was characterized by fever, chills, leukopenia or leukocytosis, eosinophilia, arthralgias, skin rash, pruritus, nausea and vomiting.

OVERDOSAGE: Massive overdosing, or acute poisoning, by Zyloprim has not been reported.

HOW SUPPLIED: 100 mg (white) scored tablets, bottles of 100 and 1000; 300 mg (peach) scored tablets, bottles of 30, 100 and 500. Unit dose packs for each strength also available.

Doctor Versus Lawyer: Why It Cannot Be Done in Maryland

By JOHN F. KING, Esq. and M. BRADLEY HALLWIG, Esq.

Messrs. King and Hallwig are affiliated with the law firm of Anderson, Coe and King, where they can be contacted for reprint and other data at 800 Fidelity Bldg., Charles at Lexington Sts., Balto., MD 21201.

Introduction

Maryland physicians who have been victimized by malicious, groundless and vexatious malpractice suits often consider countering the patient and the patient's attorney. Under the present State of Maryland law, such a countersuit cannot be maintained unless the physician has suffered some "special injury" as a result of the litigation about which he/she complains. This necessary "special injury" must be one of two things: a wrongful seizure of his/her person (imprisonment) or the wrongful seizure of his/her property (attachment). Only very rare cases (and almost never a malpractice case) involve either sort of special injury. The majority of American states have no special injury requirement for countersuits of this kind, but a minority (Maryland included) follow what has become known as the English Rule and insist on one of the two types of special injury before they will allow recovery.

As counsel to the Medical and Chirurgical Faculty, we have for the past decade been promising the assembled members at Executive Committee meetings, at House of Delegate meetings and wherever, that as soon as the proper facts came along, this so-called English Rule would be challenged in court in a suit filed on behalf of a physician against a lawyer and a patient for wrongfully charging the physician with malpractice. Physicians have been urging us to strike back, citing cases from Illinois and Florida where countersuits by physicians received national publicity. Our admonition has always been, "We haven't had a strong case factually yet. It's important to proceed only with a strong case for fear of being guilty ourselves of the very wrong about which we complain."

Finally, the right case *did* come along. Suit was filed against a lawyer and a patient, but in spite of the aggravated circumstances, the highest court in Maryland chose to ignore the case and thus to persist in protecting the Bar by its adherence to the ancient, ill-conceived English Rule requiring special injury. We present here some of the facts of the case, along with a brief discussion of the English Rule. The case is reported not only to inform, but to illustrate the need for legislation that would abolish the so-called English Rule as applied in Maryland, which effectively prevents retaliation. This remedy should be available not only to physicians, but to any aggrieved citizen who suffers because a lawyer not only files, but persists in prosecuting, an absolutely groundless claim.

The Case

The physician involved was an obstetrician-gynecologist. The patient was seen by him on only four occasions, in January and October, 1967 and in February and October, 1968. Each visit was for a gynecological examination and for the continuation of her birth control pills, which had been prescribed for her originally by another doctor. The physician found nothing remarkable during any of the four examinations and continued her prescription. After the October, 1968 office visit, the patient failed to return for her next scheduled examination and the physician never examined or treated her again.

He next heard from her in November, 1971 when she filed a malpractice suit against him as well as a number of other physicians. The Complaint specifically charged him with negligently failing to recognize symptoms that allegedly developed in February or March, 1969 (after her last visit) indicating "thrombophlebitis" and failing to advise her to cease taking the drug Norinyl in light of these symptoms. The physician was shocked by these charges inasmuch as he had performed a thorough and proper examination each time he had seen the patient and the patient

had never exhibited any symptoms that contraindicated Norinyl while under his care. An answer was filed denying the allegations.

For a plaintiff to prevail in a medical malpractice case of this kind in Maryland, a medical expert must testify that the care rendered was contrary to accepted medical standards. If a plaintiff fails to produce such expert testimony, then the trial judge will enter a judgment in favor of the defendant-physician, and the jury will not be permitted to consider the case. Consequently, if a plaintiff's attorney is unable to produce such an expert by the time of trial, he/she knows, or ought to, that his/her case cannot possibly be successful; the law forbids it.

As part of the normal pretrial discovery, it was determined that each of the experts relied on by the plaintiff were of the opinion that the gynecologist's treatment had been proper.

Despite the fact that the case against the gynecologist was doomed for want of expert testimony, the patient and her attorney continued to prosecute the case against him. It finally came to trial in Baltimore in November, 1975, and, after the plaintiff had finished putting on all of her evidence, the judge, as expected, directed that judgment be entered in favor of the physician.

Here was the case to challenge the English Rule. A more groundless suit could hardly be imagined. The very experts named by the plaintiff testified that there was nothing negligent about the care rendered by the physician. How could there be a justification for filing and continuing to prosecute such a frivolous malpractice claim?

Accordingly, in June, 1976, a countersuit was filed against both the patient and her attorney. It was alleged that the two defendants knew or should have known that their case was without merit, and that, despite this knowledge, they continued to prosecute their suit. The damages claimed included emotional and mental distress, loss of time from practice and injury to professional reputation. We could not, and did not, allege special injury.

As expected, the suit was challenged on the grounds that Maryland law did not permit recovery unless a special injury is alleged. The trial judge, bound by existing precedent from the Court of Appeals, was compelled to grant a motion to dismiss the case. This dismissal, by following precedent, set the stage for a direct, inescapable challenge of the English Rule by petition for appellate review by the highest court in Maryland, the Court of Appeals, if that court agreed to hear the appeal. As are the trial courts, the Court of Special Appeals (Maryland's intermediate appellate court) is bound by Court of Appeals precedent and cannot overrule a prior Court of Appeals decision on point. Only the Court of Appeals can overrule itself, but not every case will be heard by that Court. The law grants an absolute right of appeal only to the Court of Special Appeals. In our case, this appeal was essentially useless because that court could not overrule the prior Court of Appeals decisions that had established and perpetuated the English Rule. To reverse the trial court's dismissal, the case had to be decided by the highest court, the Court of Appeals.

Unfortunately, the Petition for Appellate Review was denied. Apparently, not even three of the appellate judges out of the total of seven had an interest in hearing the case, such petitions being usually granted if three judges so desire. It is clear, therefore, that the Legislature must be persuaded to change the law because Maryland's highest court declined even to review its previous rulings perpetuating the English Rule.

Conclusion

"Every citizen has three important interests which, among others, are protected by the law of torts—interest in reputation and honor, interest in bodily freedom and interest in financial security. A tort action for defamation provides protection for the first of these, while an action for false imprisonment protects the second. An action for malicious prosecution protects all three."¹

There is a fundamental maxim of Anglo-American jurisprudence that says "There is no wrong without a remedy." The malicious institution of groundless civil proceedings is clearly a wrong, but one that the Maryland courts have chosen to tolerate.

The Maryland precedent provides a safe harbor for persons who would use the legal system as a tool for blackmail. Their victims can either pay the blackmailer's price or pay the price for litigating out of principle to vindicate their honor; in either case, the injury ought to be compensable. A prudent person may decide to settle, and pay the cheaper price regardless of principle. Such a condition is an outrage. For the legal system, through which society compensates those who have been wronged, to be itself the medium through which an obvious wrong can be committed yet compensation be denied is anarchy. Remedial legislation is needed to correct the problem, not only for physicians, but for all citizens injured by irresponsibly-prosecuted litigation.

TREATMENT AND LEARNING CENTER FOR ALCOHOL RELATED PROBLEMS

Our purpose is to provide effective therapy in a wholesome atmosphere for the man or woman with a drinking problem.

Individual counseling and group therapy are provided for the family as well as the guests.

FELLOWSHIP HALL

A private non-profit JCAH accredited psychiatric hospital

A nature trail for hiking and meditation winds through nearly a mile of beautifully wooded area.

A medical doctor and registered nurses provide 24-hour medical care in a fully equipped infirmary.

FELLOWSHIP HALL INC.

P O Box 6929 • Greensboro, N. C. 27405 • 919-621-3381

Located off U.S. Hwy. No. 29 at Hicone Road Exit, 6½ miles north of downtown Greensboro, N.C. Convenient to I-85, I-40 U.S. 421, U.S. 220, and the Greensboro Regional Airport

Attractive, comfortable accommodations are provided for both male and female guests.

Fellowship Hall will arrange connections with commercial transportation.

Peritoneal Adhesions: Where Do We Stand?

By A. ALAMEDDINE, MD

Dr. Alameddine can be contacted for reprint and other data at 28 Highland Ave., Somerville, MA 02143.

Intraperitoneal adhesions are noted with sufficient frequency to be a cause for concern in all patients following abdominal explorations. Innumerable experimental models and methods have been used in an effort to evaluate a variety of ways to control or reduce the occurrence of postoperative peritoneal adhesion. Many substances have been proposed, locally or systemically, to prevent adhesions, among them: Dextran, Heparin, Proteolytic enzymes, antihistaminics and steroids, silicone fluid and lubricants, to cite only a few. Unfortunately, no data dealing with the effectiveness of these substances are obtained in preventing adhesion; however, there is strong evidence to suggest that they may be of some benefit, and this alone is a sufficient "raison d'être" for a justification for expanded use in humans. Clinical evaluation of the various means of control and recurrence is urgently needed.

The purpose of this article is to review the pathogenesis and the therapy and methods of prevention of peritoneal adhesions, to be undertaken once a definitive diagnosis has been achieved. The suggestions to be discussed illustrate some of the therapeutic implication of the pathologic process. Although most of this information has already been published in various medical journals and publications, it is hoped that this presentation will serve as a simplified guide.

The most common cause of intestinal obstruction is adhesion: the incidence goes as high as 50%,¹ with an overall mortality rate ranging between 4.5-24%.²⁻⁴ The presence of adhesions after laparotomy has been recorded in 91.1%.⁵ Fortunately, all adhesions do not cause distress. An interesting fact is that the frequency of recurrence is higher among those previously operated upon (relaparotomy) than among those not previously operated upon; it is stated that "every seventh, (of operated patients), had fallen a victim to recurrence, and of those who escaped recurrence every fifth had considerable distress."⁶ Distress is regarded as subobstruction attacks with intervals of pain and possibly vomitings. On the other hand, the "distress" frequency is distinctly higher at the second operation (76%). The fundamental process by which the adhesive band is formed is still a mystery, but a number of theories have been proposed. Hippocrates and Galen recognized the "belly passions." As early as 1849, famous names in medicine like Cruveilhier⁷ and Rokitsanski suggested the coagulated lymph as origin of temporary fibrinous adhesions. Hunter⁹ described as sticky substance, "nature's glue" or "gluten," holding the bowel surfaces together. In some earlier report¹⁰ the emphasis was on the idiosyncratic interpretation, such as 'fibroblastic diathesis."

Ellis¹¹ strongly advocates that bowel wall ischemia and trauma, whether mechanical, bacterial or chemical, appear to be one of the etiologic agents in the production of adhesions.

A rough pair of hands, an excessive and careless use of dry gauze pads for sponging, an improper choice of instruments and sutures, a lack of knowledge in dissection techniques and tissue crushing with big "bites"—in other words, abuse of Halsted's principles of surgery—all lead to the outpouring of fibrinous exudates with conversion into organized thick creamy bands, then to development of fibrous strands which bridge the peritoneal membranes. There is no need for a "tooth brush" or "sand papers" rubbing to cause the injurious insult to the intestinal serosa. Gervin¹² (1973) stated that any abrasion of the bowel wall causes histamine release and a decrease in fibrinolytic activity of the serosa, which is necessary in the prevention of adhesions. Fortunately, most of the fibrin are dissolved and are therefore transient.

The literature is replete with data showing that foreign bodies¹³ like starch,¹⁴ talc,¹⁵⁻¹⁶ iodine, and phenol,¹⁰ etc., increase the likelihood of capillary "oozing" of fibrin. The presence of blood

in the peritoneal cavity may be disadvantageous to the patient because of the increased post-operative morbidity, e.g. infection and ileus; however, a small amount of uninfected blood would cause no irreversible harm and be absorbed within 10-16 days.^{7, 17} Tissue irrigation with "hot" physiologic sterile solution at temperature greater than 40° centigrade causes injury by inducing hypermetabolism exceeding the capacity of the available blood supply, thus cell death and decrease in the rate of epithelialization.¹⁸

Two raw (denuded) uninjured serosal defects that are lying against each other endothelialize separately without fusing together as a rule.^{6, 19} The visceral healing is faster (five days) than parietal (eight days).²⁰

The literature has been and continues to be plentiful with regard to methods of accomplishing adequate prevention of new adhesion formation. It must be emphasized that there is little room for any hard and fast dicta, since there are many factors that influence treatment. Generally, when a multiplicity of different therapeutic regimens exists for a given condition, the reason is that none of them is completely or uniformly effective, that certainly is the case for the prevention of peritoneal adhesions. Undoubtedly, the mere limitation of peritoneal insult would do most of the "job;" for, otherwise, fibrin would deposit at anywhere from 10 minutes to two hours.²¹

Other "ingenious" methods have included¹⁰ placement of sheets of fresh bladder strips, cargile membrane (osc peritoneum), human amniotic and beef allantoic membranes, placement of lubricants like gum arabic, collodion, Vaseline, albumin and paraffin, etc. Empirically, the effect is mechanical by keeping apart injured peritoneal surfaces. By the same token, post-operative peritoneal lavage (with removal of transudates) is still subjected to criticism.²²

I believe that "drawing" the omentum down over the bowels would prevent only the visceroparietal adhesions, but not the interserous ones.

Intraperitoneal administration of Betadine® antiseptic solution (Polyvinylpyrrolidone or Povidone iodine), has been recommended at laparotomy if adhesions are expected.²³⁻²⁵ Certainly this substance is appealing and offers many theoretic advantages because of its safety,²⁶ efficacy against suppurative peritonitis²⁷ and non-interference with normal healing processes.²⁸ Other suggested methods of prevention or "destruction" of the adhesive band may be considered under the following categories which are a useful adjunct to the surgeon's armamentarium:

1. Inhibition of the coagulation of peritoneal fibrin exudate: the use of Dextran 70 or 75 intraperitoneally as advocated by Neuwirth²⁹ (1974) and others³⁰ is slowly gaining in popularity, although it had not been the favored method for routine use in humans. While the available data are insufficient to establish its role, continued trial is certainly warranted. The risks of hemorrhage from the use of Heparin³¹ far outweigh any prophylactic action on the fibrous exudate.
2. Digestion of fibrin already deposited upon the peritoneal surfaces:

There has been considerable debate about the value of Proteolytic Enzymes, Streptokinase, Urokinase, hyaluronidase and Papase (papain).³²⁻³⁴

A recent study by Gevin et al (1973), indicates that intraperitoneal Urokinase (in dogs) achieved not only a reliable, but also a safe, method for the prevention of adhesions; for no side-effects on coagulation factors or wound healing were experienced.

3. Inhibition of fibroblastic proliferation: In recent years, a number of papers have appeared reporting results of locally applied steroids and antihistaminics.³⁵⁻³⁶ Unfortunately, intraperitoneal steroids in rats might be associated with a high incidence of wound infection and breakdown of anastomoses.

Epilogue

In conclusion, until the ashes from the fires of controversy have settled, we believe that although none of these techniques have been universally effective for the control of adhesions, with further understanding of its etiology by experimental patient and clinical investigation, perhaps newer knowledge in the treatment of peritoneal adhesions will be forthcoming. Perhaps a hitherto unknown modality of treatment will appear upon the scene.

Much can be accomplished through an intelligent approach based on available knowledge and sound surgical principles. Last, but not least, one should view new suggestions and designs skeptically: "No one should test the depth of a river with both feet."

Bentyl[®]

(dicyclomine hydrochloride USP)

Capsules, Tablets, Syrup, Injection

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATIONS

Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the following indications as "probably" effective:

For the treatment of functional bowel/irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

THESE FUNCTIONAL DISORDERS ARE OFTEN RELIEVED BY VARYING COMBINATIONS OF SEDATIVE, REASSURANCE, PHYSICIAN INTEREST, AMELIORATION OF ENVIRONMENTAL FACTORS.

For use in the treatment of infant colic (syrup).

Final classification of the less-than-effective indications requires further investigation.

CONTRAINDICATIONS: Obstructive uropathy (for example, bladder neck obstruction due to prostatic hypertrophy); obstructive disease of the gastrointestinal tract (as in achalasia, pyloro-duodenal stenosis); paralytic ileus, intestinal atony of the elderly or debilitated patient; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; myasthenia gravis. **WARNINGS:** In the presence of a high environmental temperature, heat prostration can occur with drug use (fever and heat stroke due to decreased sweating). Diarrhea may be an early symptom of incomplete intestinal obstruction, especially in patients with ileostomy or colostomy. In this instance treatment with this drug would be inappropriate and possibly harmful. Bentyl may produce drowsiness or blurred vision. In this event, the patient should be warned not to engage in activities requiring mental alertness such as operating a motor vehicle or other machinery or perform hazardous work while taking this drug. **PRECAUTIONS:** Although studies have failed to demonstrate adverse effects of dicyclomine hydrochloride in glaucoma or in patients with prostatic hypertrophy, it should be prescribed with caution in patients known to have or suspected of having glaucoma or prostatic hypertrophy. Use with caution in patients with: Autonomic neuropathy. Hepatic or renal disease. Ulcerative colitis. Large doses may suppress intestinal motility to the point of producing a paralytic ileus and the use of this drug may precipitate or aggravate the serious complication of toxic megacolon. Hyperthyroidism, coronary heart disease, congestive heart failure, cardiac arrhythmias, and hypertension. Hiatal hernia associated with reflux esophagitis since anticholinergic drugs may aggravate this condition.

Do not rely on the use of the drug in the presence of complication of biliary tract disease. Investigate any tachycardia before giving anticholinergic (atropine-like) drugs since they may increase the heart rate. With overdosage, a curare-like action may occur. **ADVERSE REACTIONS:** Anticholinergics/antispasmodics produce certain effects which may be physiologic or toxic depending upon the individual patient's response. The physician must delineate these. Adverse reactions may include xerostomia; urinary hesitancy and retention; blurred vision and tachycardia; palpitations; mydriasis; cycloplegia; increased ocular tension; loss of taste; headache; nervousness; drowsiness; weakness; dizziness; insomnia; nausea; vomiting; impotence; suppression of lactation; constipation; bloated feeling; severe allergic reaction or drug idiosyncrasies including anaphylaxis; urticaria and other dermal manifestations; some degree of mental confusion and/or excitement, especially in elderly persons; and decreased sweating. With the injectable form there may be a temporary sensation of lightheadedness and occasionally local irritation. **DOSEAGE AND ADMINISTRATION:** Dosage must be adjusted to individual patient's needs.

Usual Dosage: Bentyl 10 mg, capsule and syrup: *Adults:* 1 or 2 capsules or teaspoonfuls syrup three or four times daily. *Children:* 1 capsule or teaspoonful syrup three or four times daily. *Infants:* ½ teaspoonful syrup three or four times daily. (May be diluted with equal volume of water.) Bentyl 20 mg: *Adults:* 1 tablet three or four times daily. Bentyl Injection: *Adults:* 2 ml. (20 mg.) every four to six hours intramuscularly only. **NOT FOR INTRAVENOUS USE. MANAGEMENT OF OVERDOSE:** The signs and symptoms of overdose are headache, nausea, vomiting, blurred vision, dilated pupils, hot, dry skin, dizziness, dryness of the mouth, difficulty in swallowing, CNS stimulation. Treatment should consist of gastric lavage, emetics, and activated charcoal. Barbiturates may be used either orally or intramuscularly for sedation but they should not be used if Bentyl with Phenobarbital has been ingested. If indicated, parenteral cholinergic agents such as Urecholine[®] (bethanecol chloride USP) should be used.

Product Information as of October, 1978.

**Overweight may not always be simple...
complications can develop*.
Complicated or not...**

Tenuate[®] Dospan[®] ^{IV} **(diethylpropion hydrochloride NF)** **75 mg. controlled-release tablets**

A useful short-term adjunct in an indicated weight loss program.

Overweight patients in certain diagnostic categories often require strict appetite control and a successful program of weight reduction may tend to diminish the incidence or severity of the complications in some patients. Diethylpropion hydrochloride has been reported useful in such patients and while it is not suggested that Tenuate itself in any way reduces the complications of overweight, it may have a useful place as a short-term adjunct in a prescribed dietary regimen. **Tenuate should not be administered to patients with severe hypertension; see additional Warnings and Precautions on the opposite page.**

In uncomplicated overweight.

Many patients, on the other hand, present with excess fat but no disease. While this condition is often termed uncomplicated obesity, complications of both a social and a psychologic nature may be distressingly real for the patients. In these cases, a short-term regimen of Tenuate can help reinforce your dietary counsel during the important early weeks of an indicated weight loss program.

Clinical effectiveness.

The anorectic effectiveness of diethylpropion hydrochloride is well documented. No less than 16 separate double-blind, placebo-controlled studies attest to its usefulness in daily practice.¹ And the unique chemistry of Tenuate provides "...anorectic potency with minimal overt central nervous system or cardiovascular stimulation."² Compared with the amphetamines, diethylpropion has minimal potential for abuse.

**Tenuate—it makes sense.
And it's responsible medicine.**

*Studies have shown that obesity is associated with an increased incidence of hypertension, symptomatic heart disease, adult-onset diabetes, and other diseases.

Important data on the pain of acute cystitis:

In 87% of patients studied (303 of 349), Azo Gantanol® reduced pain and/or burning within 24 hours*

A controlled, multicenter study assessed the efficacy of Azo Gantanol in relieving pain and/or burning associated with acute urinary tract infection in patients with at least 100,000 colonies per ml of a sulfonamide-sensitive organism, usually *E. coli*. In 87% of patients with initial symptoms rated "moderate to severe," Azo Gantanol therapy resulted in improvement within 24 hours.

Fast pain relief plus effective antibacterial action

Azo Gantanol®

Each tablet contains 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl.

for
the pain

for
the pathogens

Before prescribing, please consult complete product information, a summary of which follows:

Indications: In adults, urinary tract infections complicated by pain (primarily pyelonephritis, pyelitis and cystitis) due to susceptible organisms (usually *E. coli*, *Klebsiella-Aerobacter*, *Staphylococcus aureus*, *Proteus mirabilis*, and, less frequently, *Proteus vulgaris*) in the absence of obstructive uropathy or foreign bodies. **Note:** Fully coordinate *in vitro* sulfonamide sensitivity tests with bacteriologic and clinical response; aminobenzoic acid to follow-up culture media, increasing frequency of resistant organisms limit the usefulness of antibacterials including sulfonamides. Measure sulfonamide blood levels; variations may occur; 20 mg/100 ml should be maximum total level.

Contraindications: Children below age 12; sulfonamide hypersensitivity; pregnancy at term or during nursing period; because Azo Gantanol contains phenazopyridine hydrochloride it is contraindicated in glomerulonephritis, severe hepatitis, uremia, and pyelonephritis of pregnancy with disturbances.

Warnings: Safety during pregnancy not established. Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been reported and early clinical signs (sore throat, fever, pallor, purpura or jaundice) may indicate serious blood disorders. Frequent CBC and urinalysis with microscopic examination are recommended during sulfonamide therapy.

Precautions: Use cautiously in patients with impaired renal or hepatic function, severe allergic bronchial asthma; in glucose-6-phosphate dehydrogenase-deficient individuals in whom dose-related hemolysis may occur. Maintain adequate fluid intake to prevent crystalluria and stone formation.

Adverse Reactions: *Blood dyscrasias* (agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia); *allergic reactions* (erythema multiforme, skin eruption, Stevens-Johnson syndrome, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis); *G.I. reactions* (nausea, emesis, abdominal pain, hepatitis, diarrhea, anorexia, pancreatitis and stomatitis); *CNS reactions* (headache, peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo and insomnia); *miscellaneous reactions* (drug fever, chills, nephrosis with oliguria and anuria, periarthritis nodosa and L. E. phenomenon). Due to certain chemical similarities with some goitrogens, diuretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused instances of goiter production, diuresis and hypoglycemia. Cross-sensitivity with these agents exist.

Dosage: Azo Gantanol is intended for the painful phase of urinary tract infections. **Usual adult dosage:** 2 Gm (4 tabs) initially, then 1 Gm (2 tabs) B.I.D. for up to 3 days. If pain persists causes other than infection should be sought. After relief of pain has been obtained, continue treatment with Gantanol (sulfamethoxazole) to be considered.

NOTE: Patients should be told that the orange dye (phenazopyridine HCl) will color the urine. **Supplied:** Tablets, red, film-coated, each containing 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl—bottles of 100 and 500.

Ileostomy without External Appliance: The Continent Ileostomy (Kock Pouch)

By JACOB C. HANDELSMAN, MD and RONALD H. FISHBEIN, MD

These procedures were carried out at the Johns Hopkins Hospital, the Sinai Hospital of Baltimore and the Greater Baltimore Medical Center of Baltimore, MD. Both authors are Associate Professors of Surgery at the Johns Hopkins University School of Medicine. For reprint and other data, contact Dr. Handelsman at 220 W. Cold Spring Lane, Balto., MD 21210. (Artwork by Walter Handelsman.)

Introduction

The patient who is in need of a permanent ileostomy because of proctocolectomy has a greater assurance of an unburdened life today than ever before. The modern Brooke ileostomy and its modifications¹ and a number of simple, effective appliances have assisted him immeasurably in the management of his stoma. In addition, the new professionals, trained stoma specialists, are an influential support, both psychological and physical. Ostomy clubs are flourishing for the mutual benefit of their members. It has been estimated that some 85% of those with conventional ileostomies are satisfied.²

Nevertheless, a significant number of these patients find their social, physical or sexual adjustments difficult or impossible. Most often these difficulties center on the need for an appliance to be worn with the ileostomy.³

Dr. Nils Kock of Gotteborg, Sweden has devised a surgical procedure which makes it possible for a patient with an ileostomy to forego the use of a bag. In this operation, an internal reservoir and a valve are fashioned of the ileum immediately proximal to the ileostomy. The valve is designed to be fluid and gas-proof, and the patient empties himself periodically through the day by the insertion of a catheter.⁴

This option for the ileostomy patient has aroused great interest and has proved attractive to a number of patients. Performed now by a number of surgeons in Sweden, in this country and in England as well as other lands, several hundred such procedures have been carried out. Beahrs of the Mayo Clinic, and Gelernt at the Mt. Sinai Hospital in New York, have been its principal practitioners in the United States.⁵⁻⁶ Our own experience with 24 cases has drawn upon their work, has permitted us to introduce some innovations and to draw some conclusions.

This report describes our experience with the continent ileostomy (Kock pouch). The series includes patients in whom this procedure was carried out to revise a preexistent conventional ileostomy, as well as cases where the proctocolectomy and continent ileostomy were carried out simultaneously. Insofar as possible, we shall refrain from discussing the indications for the proctocolectomy.

The Operation

The operation of continent ileostomy constructs a reservoir, a valve to retain stool and gas and an ileostomy stoma through which the reservoir is evacuated.

The ileum having been transected when the colon is removed, a point 45 cm. proximal to the end is identified. Proceeding distally from this point, 30 cm. are bent into a "U" configuration to create a common chamber (the reservoir). A continuous catgut suture is placed to make a common wall (Figure 1). This wall is then incised and the suture line reinforced with a second row of catgut (Figure 2). We add support with intermittent interrupted sutures of non-absorbable material. The posterior wall of the common chamber is thus made, and the open chamber leads to the terminal 15 cm. of ileum.

This terminal 15 cm. of ileum is intussuscepted backwards through itself into the reservoir. A 4 cm. intussusception is desirable. This "nipple" so created will function as a valve (Figure 3). There is significant technical work needed to maintain this valve in position. The mesentery, obviously, resists the intussusception and may have to be thinned. At the same time,

FIGURE 1: Beginning 45 cm. from its transection, 30 cm. of ileum is sutured into a loop which will be fashioned into a reservoir.

FIGURE 2: Incision of this loop, and a reinforcing suture line construct the posterior wall of the reservoir (pouch).

care must be taken not to occlude its vessels, lest gangrene of the valve occur. We have employed four steps:

The serosa of the bowel to be intussuscepted is intentionally injured by scoring, abrading or burning with the cautery. This promotes adhesion after the inversion.

Following Gelernt's technique,⁶ we then place three or four pairs of successively-inverting seromuscular sutures close to and paralleling each side of the mesentery. As these are successively tied, the mesentery is intussuscepted without any suture crossing it. The remainder of the intussusception is completed and three additional parallel rows of through and through sutures placed.

As a fourth measure, we then suture the exterior of the intussusception where it enters the pouch in a particular way.⁷ The ileum entering the intussusception is rotated 10°-20° to offset the mesenteries. Each mesentery is carefully entered to expose the bowel wall. A suture is placed from this point to the contacting serosal wall and a row of interrupted sutures placed circumferentially. A large-bore catheter or sound is used as a stent during this part of the procedure.

Attention is then returned to the reservoir. The posterior wall is folded over anteriorly (Figure 4) and sutured closed. Two rows of catgut close the chamber (Figure 5). We reinforce this long suture line with several non-absorbable sutures.

The pouch is passed through the fold in the mesentery so that it will present anteriorly and down with the distal ileum at its superior margin.

This folding of the chamber wall results in peristaltic forces at right angles to each other. It is felt that this tends to negate their effectiveness, reducing the forces which would ordinarily respond to the obstructing valve. Gadacz's observation indicate, however, that a measurable, significant pressure occurs.⁸ The afferent loop is occluded and the pouch is filled with air and then with fluid to test the competence of the valve. Intubation releases each test-load.

The pouch is now securely-sutured around the opening made in the abdominal wall and the ileal end is passed externally. These sutures are positioned along the circumference of the entrance of the intussusception. The protruding ileum is amputated flush with the abdominal wall, keeping the distance from the valve outward at a minimum and as straight as possible to facilitate intubation. Interrupted sutures join the end of the ileum to the skin.

Because there is no need to provide space on the abdominal wall for an appliance, the stoma may be set in a low position, near the groin, for cosmetic reasons. The ileostomy may also be made flush with the abdominal wall.

The pouch is intubated and the tube sutured in position, to remain there for two weeks or more while healing occurs. This keeps the pouch emptied and minimizes pressure against the sutures. The reservoir capacity at this time is about 50 ccs. Over the ensuing weeks, it increases rapidly to a volume of 300 to 700 ccs. or more.

The patient must intubate the ileostomy three-five times daily. One of three types of catheter seems to work best and individual preference comes into play. Most patients prefer the Dow-Corning silastic tube or the Medina Polyethylene tube (size 28F) (Figure 6.)

High-residue foods—especially kernel corn and mushrooms—are to be avoided. After several weeks, however, these patients are on no restrictions beyond those given to persons with a conventional ileostomy. If the tube plugs, it is flushed and inserted again. Each emptying requires three-six minutes, and can be done in any toilet or bathroom. The patient carries a small rubber ear syringe, and if stool is too viscous, he irrigates 30-50 cc. of tapwater from any nearby source. For this, the total amount of time required is probably 30 minutes daily when the routine is established.

The Physiology of The Pouch

There appears to be little, if any, troublesome physiologic effect from the pouch. The alterations of bacterial flora which have been described have not appeared to be detrimental.⁹ Jagenberg has described the absorption from the pouch. Qualitatively it appears to be midway between normal ileal absorption and that in a patient with conventional ileostomy.

Stasis phenomena have been noted by Schjonsby and colleagues.¹⁰

The amount and force of peristalsis varies considerably. Generally, when the pouch is full, the patient is aware of a sense of tightness or weight in the area. Colic has not been reported to us. It is not unusual, however, for the patient to experience "gassy" sensations during the first two or three weeks after the surgery and these may be quite uncomfortable. This discomfort abates spontaneously.

Gadacz and his colleagues report that pouch mucosa resembles normal ileal mucosa in the manner in which sodium chloride, bicarbonate and glucose are absorbed and excreted.⁸

FIGURE 3: The terminal ileum is intussuscepted backwards into the unfinished pouch (lower right of pouch). It is secured in this position by sutures placed in a variety of positions.

FIGURE 4: The previously-constructed wall is folded anteriorly to form a chamber including the valve constructed by intussusception.

The Complications of The Operation

Intestinal obstruction has been the most common complication experienced. In no instance has this been identified with the pouch. It has accompanied proctocolectomy, and is, of course, well known when such colectomy and conventional ileostomy are performed. Some 5%-15% of patients undergoing proctocolectomy experience this.¹¹

Two serious complications may attend this surgery. The first is leakage from the pouch suture lines during the first several days following surgery. The number and length of the suture lines perhaps predispose to this. We have routinely placed abdominal drains in these cases (when proctectomy has been performed, the pelvis is also drained). While we have reexplored two such cases to drain the peritoneal cavity, more recent experiences of ourselves and others have indicated that the use of antibiotics and suction to the indwelling tube will usually suffice to deal with such leaks.

A second significant complication is leakage from the valve. If this comes about it ordinarily occurs within several weeks to six months following surgery.¹²⁻¹³ Incompetence of the valve occurs when the intussusception fails to hold. Since that portion of the valve which distracts will prolapse out of the reservoir, it takes on the configuration of a diverticulum. This captures the tip of any entering catheter, making intubation difficult. If leakage has not been present, the onset of difficulty with intubation is an ominous sign.

It is almost always possible to repair such a valve or to modify it.¹³

Bleeding from the pouch has been reported.^{6, 13} This may occur from the edge of a suture line or if the mucosa of the pouch is injured by the indwelling tube during the postoperative period.

FIGURE 5: The chamber is closed by suture. It will be turned downward, attached to the abdominal wall and the ileostomy externalized.

FIGURE 6: The patient is shown sliding the tube into the ileostomy. The open end discharges into a toilet or waste receptacle.

Review of the Current Series

Table 1 describes the patients in this series. The ages and sex merely reflect our selections since a number of criteria are to be fulfilled before we have accepted patients for this surgical procedure.

TABLE 1: Description of 24 Patients

Sex:	17 male;	7 female
Age:	17-65,	17 under 40
Disease:	Ulcerative Colitis	21
	Crohn's	2
	Polyposis	1
Operation:	Colectomy and Pouch	22
	Conversion	2

In Table 2 is shown the interval since surgery. It has been a general experience that complications occur early. For this reason we feel that our experience has validity. It is of interest that valve and pouch apparently are perfectly capable of withstanding the trauma of over a thousand intubations annually.

TABLE 2: Time Since Surgery

Three year or more	seven patients
Two years to three years	five patients
One year to two years	four patients
Five months to one year	eight patients

Table 3 discloses the complications which were associated with the pouch in our series.

TABLE 3: Complications

LEAK FROM POUCH	five
Two drained by secondary surgery	
Three treated by suction	
INCOMPETENCE OF VALVE	five
Four repaired	
Three repaired twice	
One not repaired	
RESECTION OF POUCH	two
One case of small bowel volvulus after several weeks	
One case of Crohn's disease and fistulae.	

Five patients have experienced leakage from the pouch. These leaks were from suture lines as distinguished from the valve. The first two patients, early in the series, were reexplored and drained. They healed after two-three weeks. Later in our experience, three patients leaked and stool issued from the drain site post-operatively. Several days of gentle suction to the pouch and intravenous hyperalimentation resulted in healing.

In five patients, incompetence of the valve occurred during the first several weeks or months after the original surgery. In four patients, corrective surgery was carried out. In three of these patients, two corrections were necessary.

Leakage from a valve should not be prematurely attacked surgically. We have had the experience of seeing transient infection induce temporary leakage and others have reported temporary leakage which rectified itself.

Two pouches have been resected and a conventional ileostomy made. One patient experienced a massive ileal volvulus several weeks after operation with gangrene of the pouch and a significant length of small bowel. The second patient had Crohn's disease which had not been recognized preoperatively. Resection was carried out and a conventional ileostomy made.

At this time, we have one patient in our series with an incom-

petent valve. He wears an appliance and has not undergone any corrective procedure.

Summary

In summary, 21 patients have a satisfactory pouch and valve representing 88% of the original group as shown in Table 4. Seven have needed more than one procedure to attain this. In two instances, the pouch was sacrificed. One patient awaits correction. There has been no mortality.

Discussion

If this procedure is to merit a position in the surgical armamentarium, it should fulfill two basic requisites. First, it must satisfy those who have selected it in order to meet their needs. Second, it must be within the capabilities of a number of surgeons and the clinics in which they practice.

Our patients have had a very positive attitude toward this procedure. They represent a carefully-selected group. We have attempted to be objective in describing the advantages and the hazards and complications of the procedure to them. We have insisted that the patient take a period of time to consider the specific pros and cons of the pouch versus conventional ileostomy.

We have rejected applicants for whom we felt that the likelihood of failure was unusually-high. The physical demands of repeated intubation may preclude its use for the elderly patient, for those too young or for those with specific physical infirmities. Problems of emotional instability may also be a contraindication. Nevertheless, advanced age must be carefully-weighed. Our 65-year-old patient would give no serious consideration to a needed proctocolectomy until he learned of continent ileostomy. His experience has been good, and unaffected by his years.

Obesity may pose forbidding technical difficulties and will preclude the surgery for some candidates unless it is corrected.

We have attempted to exclude patients with Crohn's disease from this surgery. The uncertain course of the disease and the danger that the bowel or the pouch itself may be affected make it too unsafe. Most series include cases of Crohn's disease which had been misdiagnosed before surgery. Two such patients appear among our cases. One was our first patient and has remained well for over three and a half years. The second patient developed a fistula within several weeks of surgery and this pouch was rejected in favor of a conventional ileostomy (Table 3.)

TABLE 4: Results

22 patients of 24 retain pouches
21 of these pouches function without appliance: 88% of the group
No mortality.

Patients who fall into the non-specific group must also be approached with caution. In Kock's experience, they also experienced unusual morbidity.¹³

In this setting, our patients have been enthusiastic about the procedure and satisfied with good results as they were achieved. When imperfect outcomes have demanded further surgery, these patients have all chosen the reparative surgery rather than conversion to conventional ileostomy. We have had similar comment from Beahrs and Gelernt.

It is important to note that patients who have refused a necessary colectomy because of the need for an appliance, have accepted proctocolectomy with a continent ileostomy, as noted above.

Second, the operation is feasible if surgeon and institution will make the necessary commitment. The international interest in the procedure, and its successful execution in a number of clinical settings, hold out the possibility that it may be more generally-available in the future.

It is tempting, therefore, to conclude that we are discussing a procedure which can be freely-offered to large numbers of patients. We feel most strongly that it is necessary for both patient and surgeon to have a clear and honest view of what is involved in this procedure. It takes longer to perform, it carries its own additional morbidity, it demands commitment and attention from attending personnel and is considerably more costly in hospitalization time.

A variety of procedures have been employed to repair leaking valves. It is not the purpose of this communication to dwell upon the technical aspects of these surgical endeavors, but they demonstrated that persistence and resourcefulness are necessary attributes for the surgeon. It is also fair to state that the modifications in suturing of the past few years have been productive. The success rate of valve competence is highly increased.

Two aspects of postoperative management merit comment. The indwelling tube which decompresses the pouch while the valve heals needs constant attention. The pouch effluent after the first two or three days thickens considerably, and the catheter and drainage tubing must be checked frequently during each day to preclude clogging. The patient may be an active participant in this monitoring procedure.

Peristaltic stimulants must be avoided. They impose external and intrinsic stresses on the valve, and disruption may occur.

Intubation is easily-learned. It is our custom to do the first intubation after the indwelling tube is out, and immediately require the patient to insert the tube. The house staff and nurses also intubate the patient. This allays all initial fears that a high degree of technical competence is needed to empty the pouch and is reassuring to all concerned. Patients are proud of this new skill and it proves far easier to learn than the application of an appliance.

A small cotton, cellulose or paper pad is worn over the stoma. This protects the clothing from mucous. The skin needs no protection.

The stoma contracts to 1½-2 cm.

We are, on the whole, increasingly-pleased with what this procedure offers. It seems to us an alternative which may be offered in good conscience. We continue to have reservations about conversions from standard ileostomy if the patient has been doing well; however, if the desire for an altered life-style seems sincere and advisable, we begin the discussions of the surgery.

This operation itself seems destined to improve. In addition, it has provided two valuable spinoffs: first, it has succeeded in making a number of patients accept proctocolectomy. Second, it has stimulated a vigorous effort to explore other methods which permit life without an appliance for the ileostomy patient.

The Quality of S_1 as an Indicator of Left Ventricular Performance

By WILLIAM F. RENNER, MD and GERARD W. RENNER, AB

W. F. Renner, MD, is on the staffs of the Union Memorial Hospital and Greater Baltimore Medical Center, both in Baltimore, and a member of the Maryland Society of Cardiology. G. W. Renner, AB, is an acoustics engineer and is associated with Applied Research Associates, Inc. of Boston, MA and Advanced Technology Systems, Inc., of Arlington, VA. For reprint and other data, write Dr. Wm. Renner at 3222 St. Paul St., Balto., MD 21218.

Introduction

The conventional teaching regarding the origin of heart sounds has been that they are produced by closure of the valves of the heart. A newer concept proposes that heart sounds are produced by vibrations of the closed and tensed valves, the subvalvular structures, the myocardium and the intraventricular blood mass.¹⁻³ This cardiohemic concept of the origin of heart sounds has given rise to the hypothesis that pathological changes in the myocardium should be expected to alter the frequency spectrum of the first heart sound.

In 1969 Adolph et al tested the hypothesis that disease states which reduced ventricular elasticity (myocardial infarction) would decrease the frequency content of S_1 and that states which increased ventricular mass (trained athletes) would give a similar result, since frequency varies directly with elasticity and inversely with mass.⁴ Using a sensitive technic for frequency analysis of the first sound during isovolumic contraction time, they recorded peak energy output of the first sound at frequencies between 30-70 c.p.s. They found a consistent and reproducible frequency "fingerprint" in 74 normal subjects and diagnostic patterns in 21 of 24 patients with acute myocardial infarction. In the normal subjects, the maximum energy output occurred at a frequency of 40 c.p.s.; in the post-infarction patients and in the trained athletes, the peak energy output was at 30 c.p.s. The patterns of athletes were similar to those of post-infarction patients.

Using a different technique and less complex equipment, we have performed frequency analyses of the first heart sound in 165 patients. Our findings confirm those of Adolph et al that normal subjects have a readily-recognizable frequency pattern with variants and that this normal pattern is distorted by myocardial infarction. In addition, we have measured the quality or sharpness of resonance of the first sound in terms of a quality factor, Q , used in acoustics to define the sharpness of resonance of a system. The Q factor has proved useful in distinguishing the abnormal pattern of the post-infarction patient from the normal variant of the athlete. The degree of distortion of the normal frequency pattern in relation to the clinical impression of the degree of myocardial damage has been observed.

Method

The equipment has been described in detail in a prior publication.⁵ Briefly, the heart sounds are recorded on a magnetic tape recorder with the patient in the left lateral recumbent position. The sounds are then passed through a sharp audio filter. As the observer listens to the first heart sound, he records the voltage output at frequencies from 20 c.p.s.-100 c.p.s. at increments of 10 and charts the results on a graph. The quality

factor, Q , is calculated from the equation: $Q = \frac{F_r}{F_2 - F_1}$, in which F_r is the resonance frequency and F_2 and F_1 are the two frequencies above and below resonance at which the average power has dropped to one-half its resonance value, i.e., 3 db down (Figure 1).

From the 165 patients in whom frequency analyses were carried out, 54 patients were selected for study in whom there was no reason to suspect abnormality, and a second group of 65

FIGURE 1: A normal frequency pattern from a 53-year-old asymptomatic female is depicted. The peak voltage output is at 40 c.p.s. (F_r). The voltage output falls off sharply below and above 40 c.p.s. F_2 represents the point at which the voltage has dropped to one-half its value, i.e., 3 db down, above 40. F_1 represents 3 db down below 40. The quality factor, Q , of the resonant system equals F_r divided by F_2 minus F_1 , i.e.

$$\frac{40}{47.5 - 33.5} = 2.8.$$

myocardial patients who had had well-documented myocardial infarction. The normal subjects were in general younger; however, the range of ages in the normal controls was from 7-86 years. The 86-year-old gentleman was active, asymptomatic and had both a normal frequency pattern and a normal ECG.

Results

Of the 54 normal subjects, 30 had a peak energy output at 40 c.p.s., 15 at 50 c.p.s. and nine at 30 c.p.s. The nine with peak outputs at 30 c.p.s. were young, physically-active subjects. One was a physical education instructor and had been an Olympic contestant; 52 of the 54 apparently normal subjects had Q factors of two or more (Fig. 2). Of the 65 post-infarction patients, 30 had a peak voltage at 40 c.p.s., 24 or almost half had a peak voltage at 30 c.p.s., and 11 had a peak at 50 c.p.s.; two had a peak at 20 c.p.s.; 63 of the 65 had a Q factor of less than two (Fig. 3). Two had a Q factor of two or more. Both of these had made good recoveries and were asymptomatic. One of the two was two years post-infarction and had had a Q of less than two-three months post-infarction.

Conclusions

Normal subjects have a readily-recognizable frequency pattern of S_1 characterized by a peak energy output at 40 c.p.s. and a sharpness of resonance as determined by the quality factor, Q , of two or more. A variant of the normal pattern has a peak energy output at 50 c.p.s. Athletic individuals often have a peak output at 30 c.p.s.

VARIANTS OF NORMAL FREQUENCY PATTERN

FIGURE 2: Three normal frequency patterns are shown. ABC depicts the common pattern with peak voltage output at 40 c.p.s. with sharp descents on either side of 40 giving rise to a Q of two or more, in this case 2.6. The secondary rise at 70 c.p.s. is seen commonly. DEF represents a common variant in which peak voltage output is at 50 c.p.s. The Q is 2.5. HIJ shows the type of pattern often seen in young athletes. Peak voltage is at 30 c.p.s. Q is 2.7.

ABNORMAL FREQUENCY PATTERN WITH VARIANTS

FIGURE 3: Three abnormal frequency patterns, all recorded from post-infarction patients, are shown. ABC represents the prototype. The voltage output is higher at 30 c.p.s. than at 40 c.p.s. The Q is less than two, in this case 1.3. DEF depicts a common variant. The peak voltage output is at 40 c.p.s. The descent from 40 c.p.s. is relatively slow, giving rise to a Q of less than two, in this case 1.2. HIJ was recorded from a patient with an old anterior myocardial infarction and severe angina. It is unusual in that the voltage output at 20 c.p.s. is as high as that at 30 c.p.s. and the voltage at 30 c.p.s. is considerably higher than that at 40 c.p.s. This is thought to represent severe myocardial abnormality.

Post-infarction patients tend to have a lower peak energy output and a Q of less than two, usually close to one.

The degree of distortion of the normal frequency pattern tends to correlate with the clinical impression of the degree of myocardial abnormality.

Frequency analysis of the heart sounds carries no risk to the patient, causes no discomfort and can be carried out quickly and inexpensively in an office setting.

This preliminary exploration of the potential value of frequency analysis of the first heart sound as a diagnostic tool suggests that further clinical investigation is warranted.

Pulmonary Resuscitation—Howard Atwood Kelly, 1894

By JEAN-MAURICE POITRAS, MD

For reprint and other data, contact Dr. Poitras at 107 Edgerton Rd., Towson, MD 21201; he is also in the Department of Emergency Medicine at North Arundel Hospital, Glen Burnie, MD.

Attempts at pulmonary resuscitation are not new to our generation. In the Book of Genesis, God blows breath into Adam to give him life. The Bible makes other references to pulmonary resuscitation by blowing breath into the mouths of newborns or others who are not breathing. Throughout the ages, there have been countless references of attempts at pulmonary resuscitation.

Howard Atwood Kelly, (1858-1943), one of the greats of the Johns Hopkins Hospital and Medical School, was the possessor of an inventive mind which he made use of to the fullest. One example of his ingenuity and creativity is illustrated in the reprint of a paper by Dr. A. A. Hare, Professor of Therapeutics in the Jefferson Medical College of Philadelphia. In this paper, Dr. Kelly demonstrates his own method of pulmonary resuscitation which, like many others, has now dropped into oblivion.

The paper by Dr. Hare was read before the Johns Hopkins Medical Society on Nov. 19, 1894 and was entitled *The Posture of the Head in Accidents When the Patient is Under an Anesthetic*.

The paper was later published in the *Bulletin of the Johns Hopkins Hospital* of January, 1895.

Dr. Hare discussed the physiology and anatomy of pulmonary arrest, especially with the use of chloroform which he considered could be a dangerous anesthetic, and his methods of treatment with artificial respiration and atropine when pulmonary complications arose. The methods of artificial respiration he discussed were Sylvester's and Marshall Hall's, both of which are long outmoded.

After the completion of Dr. Hare's presentation, there were several interesting discussions by Drs. Kelly, Osler, Halsted, Abel and Theobald, all of whom were apparently well-acquainted with the advantages as well as the dangers of the use of chloroform anesthesia.

The following discussion gives only the comments of Dr. Kelly, but the ideas of others may be read in the original article which is available in our Faculty Library. It is also of note, that, although Dr. Hare is the author of the article and Dr. Kelly only one of the discussors, the two photographs used in the article are those demonstrating Dr. Kelly's discussion.

Dr. Kelly started his comments with a general discussion of chloroform anesthetic and remarked that "Dr. Wood of the University of Pennsylvania had said that a surgeon having a death from chloroform should be indicted for murder." He continued he left the choice of anesthesia up to the anesthetist, the majority of whom chose ether. He, himself, preferred chloroform for most cases, but never tried to influence the anesthetist.

The following paragraphs are taken verbatim from the articles and show some of the problems of the anesthetist of those days as well as Dr. Kelly's method of solving one of the problems:

"Regarding methods of resuscitation, I have found a method of my own exceedingly satisfactory. I have treated about 15 cases with uniform success by this method, which I believe to be the best for keeping up artificial respiration. I find, too, that I have been following the principle laid down by Dr. Hare—that of the extended and slightly-flexed head. On the first indication of failing respiration the administration of the anesthetic is instantly suspended and the wound protected, if abdominal, a broad piece of gauze is laid over the intestines under the incision. An assistant steps upon the table and takes one of the patient's knees under each arm, and thus raises the body from the table until it rests upon the shoulders. The anesthetizer, in the meantime, has brought the head to the edge of the table, where it hangs extended and slightly-inclined forward. This position, shown in the accompanying cuts, is similar to that described by Dr. Hare and resembles that taken by the runner when he is breathing hard. The patient's clothing is pulled down under her armpits, completely baring the abdomen and chest. The operator, standing at the head, institutes respiratory movements as follows: inspiration by placing the open hands on each side of

FIGURE 1: INSPIRATORY MOVEMENT. (Dr. Kelly is manipulating the chest.)

FIGURE 2: EXPIRATORY MOVEMENTS.

the chest posteriorly over the lower ribs, and drawing the chest well forward and outwards, holding it thus for about two seconds (Figure 1); expiration, reversing the movement by replacing the hands on the front of the chest over the lower ribs and pushing backwards and inwards, at the same time compressing the chest (Figure 2). The success of the manoeuvre will be demonstrated by the audible rush of air in and out of the chest.

"The heart and pulse should be constantly-watched. As respiratory movements are continued, a little flickering pulse wave will be observed at the wrist, which shortly becomes faint and regular, and gradually increases in strength. From 10-30 of these acts of induced respirations will usually suffice to excite voluntary respiratory movements, which begin with short jerky, gasping breaths, becoming louder and then regular. The movements must then be timed to suit the natural efforts. As the depth of inspiration increases, the color slowly returns, the pupils contract and the danger is past. In women with contracted, fusiform chests, (tight lacers), this procedure is not available; in such cases respiration should be induced by placing one hand on the lower third of the sternum, and the other on the back opposite the first, and alternately squeezing the chest and relaxing the pressure when air

will be audibly forced in and out, and the patient revived as by the previous method; it also fails in an old rigid chest."

A closing question for consideration: Could the reason for his success in 15 cases be that both of these methods provoke simultaneous extensive cardiac massage and artificial respiration? ☐

Carotid Endarterectomy in a Small Community Hospital: A Team Approach

By JACK KUSHNER, MD; GARY RICHARDSON, MD and PETER SCHILDER, MD

This paper is from Anne Arundel General Hospital, Annapolis, MD. For reprint and other data, contact Dr. Kushner at 20 Ridgely Ave., Annapolis, MD 21401.

Introduction

What is the current status of surgery on the carotid artery in your community hospital? This challenging question was recently raised in an article by Easton and Sherman.¹ Whereas previous reports²⁻⁴ have demonstrated an acceptable mortality rate and a low complication rate, these authors have reported an operative stroke rate of 14.5% and a mortality rate of 6.6%. These alarming rates were also discussed at the recent meeting on *Correctible Causes of Cerebral Ischemia* in Chicago. This stimulated us to research and analyze our results so that we could learn just how our small community hospital was faring in this field.

The Anne Arundel General Hospital is a 220-bed community hospital in Annapolis, MD. Although the medical staff consists of 160 physicians, only three specialists deal regularly with the surgical treatment of cerebrovascular insufficiency. All of the patients were evaluated by a neurologist and a neurosurgeon; the carotid artery surgery was done jointly by a neurosurgeon and a vascular surgeon. Each specialist made a definite and distinct contribution, and the results, which are to be reported, justify this team approach.

Method

A retrospective study was done on 35 consecutive patients who had carotid artery surgery from 1973-78. Of this group of patients, 20 were men and 15 were women. Although the Anne Arundel General Hospital serves a racially-mixed community, only one of the patients was black; all of the other patients were white. The majority of the patients were between 55-70 years of age. There were five patients in the group who were older than 80 years of age. The patients have been followed from only a few months to as long as 48 months.

Indications

The patients for carotid endarterectomy were categorized into three major groups. The first group included those patients who had a documented transient ischemic attack of either or both the cerebrum or the retina. This was the most frequent indication for surgery. The neurological history and the physical examinations had to be supportive of the diagnosis. We felt that it was important that no neurological deficit was present at the time of surgery. The second group of patients were those who suffered a frank stroke, but who recovered significantly over the ensuing six weeks. Five patients from the above two groups of patients had a second operation on the contralateral carotid artery six weeks after the initial surgery. The decision to operate on the contralateral artery was usually based on a marked stenosis observed at the time of angiography. Since these patients had suffered either a stroke or a transient cerebral ischemic attack, surgery on the uninvolved side was felt to be justified. The last group of patients included those who were found to have an asymptomatic carotid artery bruit and who were found to have a carotid artery lumen of only 1 mm.-2 mm. Only three patients were in this controversial category.

Surgery was not recommended for a patient with an evolving stroke or a stroke in progression. Emergency surgery was not performed on any patients with a totally-occluded artery and a severe neurological deficit.

Preoperative Evaluation

All of the patients were examined by both a neurologist and a neurosurgeon. In the majority of the patients, a spinal tap was done to be certain there was no subarachnoid hemorrhage.

The CAT scan of the brain replaced the nuclear brain scan and gave immediate information about the status of the brain and the presence of a cerebral infarction. Although angiography was routine, there was no standard angiographic protocol or format. Most of the patients were studied by the Seldinger Technique or the retrograde femoral artery route. Some patients had such extreme arteriosclerosis that no catheter could be introduced through the femoral artery into the aortic arch. In a few patients, the catheter was inserted into the aortic arch via the brachial artery or through the translumbar approach. Occasionally, the retrograde brachial arteriogram was the best arteriogram that could be obtained.

Operative Technique

Preoperatively, venous and arterial lines were inserted. Radial arterial pressure was constantly recorded and the electrocardiogram was monitored on a Hewlett-Packard aggressive treatment cart. After the patient was anesthetized, a pad was placed under the shoulders and the head was elevated in a semi-Fowler's position.

The carotid artery surgery was done by making an incision along the anterior border of the sternocleidomastoid muscle. The common carotid artery was identified and umbilical tape was passed around it with a Rumel clamp. The artery was skeletonized and 1% Xylocaine was injected around the carotid body. Tapes were passed around the external and internal carotid arteries. A 2-0 silk tie was passed around the superior thyroid artery and the hypoglossal nerve was isolated. A segment of the external jugular vein was isolated and removed so that it could be used later for a vein patch graft; 5,000 units Heparin were given intraarterially into the common carotid artery. The common carotid artery was clamped momentarily while the Javid bypass shunt was inserted into the internal carotid and common carotid arteries. The shunt was used in all cases and no EEG recording was made. No stump pressure was recorded, although the internal carotid artery back-flow was noted. When the shunt was in place, the endarterectomy was performed. The artery was then irrigated with saline. Then the arteriotomy was closed with a 6-0 prolene suture. A Satinsky clamp was used after the Javid bypass shunt had been removed so that the rest of the artery could be closed. Protamine (50 mgm.) was given intravenously after the artery was sutured. The wound was closed in layers; no drain was left in place.

Results

Forty carotid endarterectomies were done on 35 patients. To date, 33 of the 35 patients are alive. One patient who had a frank stroke had a carotid endarterectomy six weeks after his stroke. At the time of surgery, he was thought to have recovered, even though he had a unilateral hyper-reflexia. During surgery, the patient had another stroke and was rendered aphasic and hemiplegic. Four weeks later he expired. One patient died of a myocardial infarction six months after having carotid artery surgery; 38 carotid endarterectomies were done without any significant or permanent neurological deficit. Most of the patients were discharged one week after their carotid artery surgery.

In the high-risk frank stroke group, there were four patients who had carotid endarterectomies. Six weeks following a stroke, one patient underwent a successful carotid endarterectomy. He was discharged one week later. The contralateral carotid was operated upon six weeks later. After two months, he resumed serving as a judge in the local court.

One patient had a stroke during angiography. Despite immediate surgery, she did not improve and still has a permanent neurological deficit.

Two patients developed a wound hematoma which required surgical evacuation. These patients did well subsequently. There

were no wound infections in any of these patients. Four patients had a mild hypoglossal nerve paresis, but these patients improved in a few weeks.

Three patients developed a serious cardiac arrhythmia. One patient had a permanent cardiac pacemaker inserted prior to carotid artery surgery and two other patients required pacemaker insertion in the postoperative period.

Discussion

Examination of Table 1 reveals that 35 patients had 40 carotid endarterectomies. Only one patient had an operative related stroke and subsequently expired four weeks later. This single patient was from the high-risk stroke group. Even though he had a residual unilateral hyperreflexia six weeks after his stroke, we felt that he should have a carotid endarterectomy before he had a second, more devastating stroke. The unfortunate result in this single case was no reason to deny other patients the life-saving advantages of having carotid artery surgery. Three other patients in this same group did well.

One other patient was listed as having a permanent neurological deficit following surgery. This patient developed her permanent neurological deficit during angiography. This complication was not attributed to the surgery. She was taken to surgery immediately after the arteriogram. Despite the use of a shunt and a vein patch angioplasty, we were not able to reverse her neurological deficit.

Mention should be made of other non-invasive methods of evaluating carotid artery stenosis. Ophthalmodynamometry was done on most of our patients. Although this test can suggest the diagnosis if it is positive, this certainly does not indicate the absence of an ulcerated plaque if it is negative. To date, we have not used phonoangiography or oculoplethysmography because we are not convinced that these tests will add anything of substantial value. Negative examinations with these tests could easily overlook an ulcerative carotid plaque which emits emboli to the brain.

Although we are reporting the results of 40 carotid endarterectomies, a stroke mortality rate of 2.5% is in keeping with the best of other published series. We feel that our team approach has contributed significantly to the results which have been obtained. We would urge other small community hospitals to adopt a similar policy.

Summary

A retrospective study of 40 consecutive carotid endarterectomies was done to determine the stroke rate and the mortality rate in a 220-bed community hospital. Only one patient had an operative related stroke and subsequently expired. The low stroke mortality rate of 2.5% is attributed to the team approach to the problem of carotid artery surgery.

3. Asymptomatic Bruits	3	3	1	0	0
4. Total	35	40	9	2	1

Three patients had carotid artery surgery for an asymptomatic carotid artery bruit. One of these patients had a transient hemiparesis after surgery which lasted for one hour and then completely cleared. We felt that these particular patients were very likely to develop a stroke in the future because their carotid artery lumens measured 1 mm.-2 mm. The decision to operate on these patients was influenced by Javid's study of the natural history of carotid atheromas.⁵

Table 2 indicates that 33 patients are still alive. One patient died four weeks after his carotid artery surgery. The other patient died six months after a myocardial infarction.

The advantages of a complete aortic arch study and four vessel examination of all the extracranial and intracranial vessels are well-known. When the diagnosis is apparent on the initial aortic arch injection, and when the carotid stenosis is severe, we are not eager to selectively insert a catheter into that artery for further injections. One of our patients did have a stroke during angiography and, since then, we have not been as insistent on obtaining complete views of the intracranial vessels. We are aware of the pitfalls and possible errors with this approach, but we feel that our results thus far justify this flexibility.

Editorial

Teamwork as an approach to carotid artery disease is both logical and necessary for good patient care. Carotid artery stenosis is a symptom of generalized arteriosclerotic peripheral vascular disease which may affect multiple body systems.

The appropriate leader of this team is neither the neurologist, neurosurgeon nor the cardiovascular surgeon who so often admit these patients. The real leader should be an internist or cardiologist who has the capacity to take a multi-system approach to this problem.

Acute stroke units, as well as many research units, have documented the high incidence of serious medical problems in patients presenting with TIAs and stroke. Most patients, whether approached medically or surgically, die from acute coronaries within the first five years of follow-ups. Large numbers of significant arrhythmias are picked up by continuous monitoring and a good percentage of acute silent MIs present as strokes. Anemias, uremias, vasculitides and endocrine disturbances may precipitate cerebrovascular ischemia. Seizure disorders, brain tumors and subdural hematomas may mimic this process.

Perhaps the stroke/mortality related to four vessel angiography and carotid surgery would be greatly reduced if patients were selected more carefully. The need for the surgical approach would probably be significantly-reduced if the medical problems were appropriately-treated.

The degree of carotid stenosis alone may not be the most important factor in determining patient prognosis. Perhaps cardiac output is more important and perhaps if we diagnosed bradycardia first, we wouldn't need the endarterectomy, but just the pacemaker.

Stroke mortality rate may also be reflective of the frequency that an individual procedure is performed by the operating surgeon. Neurosurgeons have shown quite readily that aneurysm surgery should be approached in large centers where the procedure is done with great regularity by specific teams who can gain great expertise in this type of surgery. I personally suspect that arch aortography and carotid endarterectomy are no different. The figures presented by Drs. Kushner, Richardson and Schilder reveal that, if evenly-split, no surgeon did more than four of the procedures in that hospital per year. In Easton and Sherman's paper, if the procedures were distributed evenly, there was no better frequency of surgery by individual surgeons. Perhaps teamwork should go one step further to include large hospital referrals.

The MPP Nurse. A Special Person.

All the nurses who work for Medical Personnel Pool are special. What makes them so special? Being a skilled professional and being associated with other professionals with extremely high standards of excellence. Knowing their skills will be fully utilized by MPP staff's careful assignment matching. And also, very importantly, by being able to devote as much time to their nursing career as they wish without sacrificing their personal lives.

MPP's concept of flexible scheduling allows our employees to work as many hours as they wish or as little on the days and weeks convenient to their individual schedule. Everyone benefits as valuable nursing skills which would otherwise be lost are being provided for patient care.

A flexible schedule is only one of the many benefits that await you when you work for Medical Personnel Pool, one of the most highly respected nursing services in its field. Choice of assignments, extensive insurance coverage including professional and general liability and worker's compensation insurances, in-service education, competitive salary, and a reputation for high standards are just a few of the others.

To learn more about the many opportunities awaiting you at Medical Personnel Pool, stop by your local MPP office.

Clinical Biofeedback

By JESSE RUBIN, MD

Abstract

Biofeedback is a new and promising clinical tool in the treatment of several disorders including tension and migraine headache, anxiety states and psychosomatic disorders. The history and basic assumptions behind the use of biofeedback is given and its current clinical status with regard to a number of symptoms is defined. Specific clinical procedures used by the author are described, as are some of the limitations and difficulties inherent in the therapy.

Introduction

Biofeedback has been defined as, "The use of monitoring instruments (usually electrical) to *detect and amplify internal physiologic processes* within the body, in order to make this *ordinarily unavailable* internal information *available* to the individual and literally to feed it back to him in some form . . . The clinical importance of this is that utilizing such organ-specific artificial feedback, with continued exposure and practice . . . there is evidence that individuals can . . . *bring under partial conscious control* particular bodily functions that ordinarily are not subject to conscious control (like heart rate and blood pressure, for example) or, which ordinarily are under only minimal conscious control, like tension in the frontalis and occipitalis muscles."¹ (italics mine)

Biofeedback therapy may thus be thought of as the use of electronic equipment to extend the patient's proprioceptive and enteroceptive capacities, thereby permitting (or encouraging) him to change specific targeted functions in a physiologically desirable direction.

Much of this extension of sensorium involves smooth and striated muscle. Normally, we have only very crude information about the state of our smooth muscles, except in cases of extreme deviation from usual tension-relaxation cycles. Even in our striated muscles, we are often aware of only the *effects* of tension, but not of the state of tension itself. (As for example, in tension headache and neuraesthenic exhaustion.) There are also physiologic functions *not* connected with smooth or striated muscle which

can be monitored and fed back to individuals.

Such functions include galvanic skin response, peripheral blood flow (as measured by temperature) and electroencephalogram. Indeed, it is now possible to construct biofeedback equipment for most measurable physiologic parameters, given the money and technical resources.

That we can simply measure these parameters is nothing new. Electromyography, electroencephalography, electrocardiography and so on have been part of the medical diagnostic armamentarium for some time. What *is new* is the idea that information derived from such monitoring devices can be fed back instantaneously and continuously to a patient in order to help him control and shape the physiologic function monitored. Indeed, until about 1967, it was generally assumed by the medical and scientific community that voluntary control, and the capacity to learn new behaviors, was possible only in those areas of functioning which are 1) supplied by the "voluntary" nervous system, 2) effected by striated muscles and 3) subject to the command of the "conscious mind."

However, in 1967, Miller and Di-Cara² reported that 21 of 23 curarized rats were able to learn to increase and decrease their heart rate by as much as 25% when such changes were immediately rewarded by electrical stimulation of the medial forebrain bundle (a pleasure center). Though subsequent attempts to reproduce this specific experiment have failed,³ the report spurred a great deal of interest in the study of "visceral (autonomic) learning." It was reasoned that if animals could learn to control their heartrate in the absence of skeletal muscle activity (they were curarized), then perhaps human beings suffering from a variety of psychosomatic, medical and psychiatric disorders could similarly learn to change their visceral behavior in a physiologic or healthy direction.

Both before and after Miller's provocative findings, a number of researchers were utilizing instrumental monitoring and feedback techniques in animals and humans

to test both the limits of the technique and the possible therapeutic uses of it. Such studies proliferated sufficiently to justify the annual publication, beginning in 1969, of a collection of studies involving visceral learning and biofeedback.⁴ During the past two or three years, the field has moved from basic research through clinical and applied research into the area of practical clinical application.

As with any new therapeutic modality, biofeedback has been the subject of a core of steady and reliable research, along with dramatic, overly-enthusiastic claims⁵ on the one hand, and by tough but careful criticism⁶⁻⁷ on the other.

This article presents a cautiously optimistic view of the current status and future promise of biofeedback therapy in clinical medicine.

Antecedents

Biofeedback therapy derives from three main sources. They are:

1. Operant conditioning: Most of the best animal and human research in biofeedback has been done by behavioral psychologists using the principals of operant conditioning first developed by B.F. Skinner.⁸ Roughly, it may be said that operant conditioning utilizes behaviors which naturally occur in the subject's (animal or human) repertoire and selectively reinforces them positively or negatively (i.e., by rewards or punishment) in order either to augment or diminish (extinguish) these behaviors.

For example, by feeding a pigeon a pellet of food whenever his natural movements roughly deviate to the right, the pigeon will soon begin approximating walking in a clockwise circle. Food rewards are then given only for movements which more finely approximate circularity. This process is called shaping. Applied as a therapeutic technique in humans, it is called behavioral, modification therapy. As Ferster has written,⁹ "The dramatic experience of conditioning an animal, shared alike by novice and professional, in which the experimenter by contacting the animal only through a button which operates the food-dispensing mechanism increases the frequency of a performance and shapes it into a

new complex form all in a matter of a few minutes, is one of the most important sources of belief that behavioral psychology can contribute to the solution of human problems."

Even prior to the development of biofeedback techniques, operant conditioning methods were used to investigate the processes of visceral learning. Therefore, once appropriate monitoring instruments for various physiologic functions were developed, feeding back instrumental readings in the form of rewards or punishment fits easily into the operant conditioning model. For example, if a rat changed his heart rate, he would receive a pleasurable stimulation to the brain. This was the feedback mechanism used in Miller's classic experiment. Transposed into work with humans, change in heart rate would be reinforced by a feedback signal such as a musical tone. The reward for the human is not electrical brain stimulation, but a knowledge of mastery over one's own heart rate. Thus, most behavioral psychologists working in the field view biofeedback as simply one aspect of behavior modification therapy.

2. Medical relaxation treatments: At about the turn of the century, Dr. J.H. Schultz, a German physician, following work done by Oscar Vogt, developed a complex and elegant form of relaxation therapy for psychiatric and psychosomatic disorders. This treatment, which came to be called Autogenic Therapy, involved frequent practice by the patient of a standard set of "autogenic" phrases—such as, "My arms are getting heavy" and "My legs and arms are warm," "It breathes me."

In order to induce a state of relaxation, and a concomitant reduction in nervous tension and anxiety, these phrases were daily practiced by the patient. Proper posture, passive (as opposed to active) concentration on the phrases and capacity to make mental contact with the bodily parts involved in the phrases were deemed essential for success in autogenic therapy. Autogenic therapy remained an obscure treatment modality in the United States until recently. Schultz's work has been carried on by his pupil, Wolf-

gang Luthe, who has written a definitive, six-volume work on Autogenic Therapy.¹⁰

About 20 years after Schultz began his work, and apparently independent of it, the American psychiatrist, Jacobson, developed other methods to achieve relaxation, which he first called progressive relaxation and later called "operational control."¹¹ Though the techniques of Jacobson and Schultz differ, some basic assumptions and goals are the same. Both assume that mental tension and physical tension are inseparable, and that if physical tension can be relieved, mental tension simply will not occur. In a sense, they work from the outside in. This complements the psychoanalytic approach, which works from the inside (the mind) out, and which takes the position that if emotional conflicts are understood and resolved, then the physical sequelae of these conflicts (tension headaches, anxiety states, peptic ulcer, etc.) will be relieved.

Thus, the Schultz-Jacobson approach views tension and anxiety as a generalized, non-specific state which can often be treated (at least in the early stages) without regard to the specific content of the conflicts involved. Luthe, for example, feels that autogenic phrases initiate *general* health-oriented homeostatic mechanisms, and that *specific* mechanisms should be involved only later in therapy and with caution. Psychodynamic (psychoanalytic) psychiatry, on the other hand, places its emphasis on the specific of the conflicts which underlie anxiety.

One psychoanalyst, however, explicitly recognized that bodily states, particularly muscle spastic states, were an integral component of emotional conflict. Wilhelm Reich wrote extensively about the somatic expression of a number of characterologic and neurotic problems in the 1920s and the 1930s. His investigations led him eventually out of the mainstream of psychoanalysis and medicine; however, along with Schultz, Luthe and Jacobson, his emphasis on the somatic and muscular correlates of disordered psychophysiology constitute an important source of clinical data for biofeedback therapy.

The Great Laxative Escape

COLACE[®]

dioctyl sodium sulfosuccinate

Colace means escape—from laxative stimulation, from laxative harshness, from laxative habit. Colace gently helps soften stools for easy, painless, unstrained elimination. It's the great laxative escape, from infancy to old age. Available in 100 and 50 mg. capsules. Syrup or liquid.

MeadJohnson

PHARMACEUTICAL DIVISION

COMPATIBILITY

Eastern Tiger Swallowtail Butterfly
(*Papilio glaucus*)

Does it influence your choice of a peripheral/cerebral vasodilator*?

Vasodilan—compatible with coexisting diseases (e.g., glaucoma, diabetes)

Vasodilan has not been reported to affect the course of coexisting disease; it has not been reported to affect blood sugar levels or to raise intraocular pressure.

Vasodilan—compatible with concomitant therapy

Vasodilan has not been reported to affect the treatment of coexisting disease; it is compatible with such drugs as hypoglycemics and miotics.

Vasodilan—compatible with your total regimen for vascular insufficiency

Vasodilan can be a valuable adjunct in planning a total therapeutic program for vascular insufficiency.

***Indications:** Based on a review of this drug by the National Academy of Sciences-National Research Council and/or other information, the FDA has classified the indications as follows:
Possibly Effective:
1. For the relief of symptoms associated with cerebral vascular insufficiency.
2. In peripheral vascular disease of arteriosclerosis obliterans, thromboangiitis obliterans (Buerger's Disease) and Raynaud's disease.
Final classification of the less-than-effective indications requires further investigation.

Composition: Vasodilan tablets, isoxsuprine HCl, 10 mg. and 20 mg. Vasodilan injection, isoxsuprine HCl, 5 mg., per ml.

Dosage and Administration: Oral: 10 to 20 mg., three or four times daily. Intramuscular: 5 to 10 mg. (1 or 2 ml.) two or three times daily. Intramuscular administration may be used initially in severe or acute conditions.

Contraindications and Cautions: There are no known contraindications to oral use when administered in recommended doses. Should not be given immediately postpartum or in the presence of arterial bleeding.

Parenteral administration is not recommended in the presence of hypotension or tachycardia.

Intravenous administration should not be given because of increased likelihood of side effects.

Adverse Reactions: On rare occasions oral administration of the drug has been associated in time with the occurrence of hypotension, tachycardia, nausea, vomiting, dizziness, abdominal distress, and severe rash. If rash appears the drug should be discontinued.

Although available evidence suggests a temporal association of these reactions with isoxsuprine, a causal relationship can be neither confirmed nor refuted.

Administration of single dose of 10 mg. intramuscularly may result in hypotension and tachycardia. These symptoms are more pronounced in higher doses. For these reasons single intramuscular doses exceeding 10 mg. are not recommended. Repeated administration of 5 to 10 mg. intramuscularly at suitable intervals may be employed.

Supplied: Tablets, 10 mg., bottles of 100, 1000, 5000 and Unit Dose; Tablets, 20 mg., bottles of 100, 500, 1000, 5000 and Unit Dose; Injection, 10 mg. per 2 ml. ampul, box of six 2 ml. ampuls.

U.S. Pat. No. 3,056,836

VASODILAN[®] 20-mg tablets

(ISOXSUPRINE HCl)

20 mg q.i.d. recommended dosage

This asthmatic isn't worried about his next breath...

**he's active
he's effectively
maintained on**

QUIBRON[®]

Each capsule or tablespoonful (15 ml) liquid
contains theophylline (anhydrous) 150 mg
and glyceryl guaiacolate (guaifenesin)
90 mg

- theophylline for effective
around-the-clock
bronchodilator therapy
- 100% free theophylline

Indications: For the symptomatic relief of bronchospastic conditions such as bronchial asthma, chronic bronchitis, and pulmonary emphysema.

Warnings: Do not administer more frequently than every 6 hours, or within 12 hours after rectal dose of any preparation containing theophylline or aminophylline. Do not give other compounds containing xanthine derivatives concurrently.

Precautions: Use with caution in patients with cardiac disease, hepatic or renal impairment. Concurrent administration with certain antibiotics, i.e., clindamycin, erythromycin, troleandomycin, may result in higher serum levels of theophylline. Plasma prothrombin and factor V may increase, but any clinical effect is likely to be small. Metabolites of guaifenesin may contribute to increased urinary 5-hydroxyindoleacetic acid readings, when determined with nitrosonaphthol reagent. Safe use in pregnancy has not been established. Use in case of pregnancy only when clearly needed.

Adverse Reactions: Theophylline may exert some stimulating effect on the central nervous system. Its administration may cause local irritation of the gastric mucosa, with possible gastric discomfort, nausea, and vomiting. The frequency of adverse reactions is related to the serum theophylline level and is not usually a problem at serum theophylline levels below 20 mcg/ml.

How Supplied: Capsules in bottles of 100 and 1000 and unit-dose packs of 100; Liquid in bottles of 1 pint and 1 gallon.

See package insert for complete prescribing information.

3. Objective investigation of meditative states: In the 19th Century, there were isolated attempts by Western physicians to understand the sometimes extraordinary feats and trance-like states of Yoga and Zen masters. However, truly useful data concerning these phenomena awaited the development of modern instrumentation. In recent years, a number of studies⁴ have uncovered potentially useful information for practitioners of Western medicine. Important among these is Wallace's study of the physiology of meditation.¹³ Wallace studied experienced meditators and found that during meditation, a number of their physiologic functions altered in the direction of relaxation and diminished sympathomimetic response. These changes persisted for several hours after the meditative experience.

Biofeedback Therapy: Basic Assumptions

The following assumptions are the basis of a rational approach to biofeedback therapy. They are adapted from Gaarder.¹⁴

1. Many medical, psychiatric and psychosomatic illnesses are characterized by what may be termed either an anxiety state or a high nervous tension level or an inefficient use of psychic and somatic energy or an unhealthy and persistent high arousal level.

2. Each person has his own (probably constitutional) pattern of response to chronic high tension levels, which occurs in two steps. First, there is an intermittent fluctuation in certain physiologic parameters into and out of normal range (labile blood pressure, early tension headaches, gastrointestinal spasm of a preulcerous variety, intermittent anxiety attacks); second, there is a fixed psychosomatic state of ill health (essential hypertension, peptic ulcer, chronic tension headache, chronic severe anxiety state).

3. Less reactivity to stress and lowering of the arousal state (or tension level) may prevent or alleviate these difficulties. More specifically, it would be expected that shift from a predominantly trophotropic response (high-stress, hyperarousal, predominantly sym-

pathetic) toward a predominantly trophotropic response (tranquility, lower arousal, decreased sympathetic activity) would be useful to "high stress reactive" patients. The trophotropic response has been nicely recast and renamed for clinical purposes by Benson¹⁵ as the "relaxation response." The relaxation response is characterized by diminished oxygen consumption, diminished respiratory rate, diminished heart rate, increase in EEG alpha waves, increase in galvanic skin response, decreased muscle tension and possibly decrease in blood pressure.

4. Subjectively experienced heightened arousal has somatic correlates which can be monitored. Green and Green¹⁶ hypothesize that, "Every change in the physiologic state is accompanied by an appropriate change in the mental-emotional state, conscious or unconscious, and, conversely, every change in the mental-emotional state, conscious or unconscious, is accompanied by an appropriate change in the physiologic state." (This may not be true for all people. For example, Raskin¹⁷ reported one patient who was able to achieve deep muscle relaxation, but reported that he still felt subjective anxiety. However, based on the author's and others' clinical experience, for the vast majority of the population, the assumption holds true.)

5. "Visceral learning" does occur. That is, if people are fed appropriate information about the

functioning of their smooth and striated musculature, circulatory functioning or brain waves, they can learn to change and control them, to some degree.

Current Status of Clinical Biofeedback

With the transition of biofeedback from the research to the clinical setting, reliable instrumentation has become available on a commercial basis to physicians, and a clinical biofeedback literature has come into existence. (Unless otherwise noted, observations in this section generally follow material presented in Birk.¹) In general, biofeedback is used in two somewhat overlapping but distinct ways. First it is used as a direct attempt to normalize a specific "abnormal" or symptomatic function as illustrated in Table 1. (Some of these applications are still experimental. Table 1 is intended as illustrative of the approach in this first group of patients, rather than as a comprehensive classification of clinical indications for biofeedback.)

Second, biofeedback is used in a more general, less specific way, to help patients shift from a predominately ergotropic (anxiety) response to a predominately trophotropic (relaxation) response as a way of dealing with stress. The important therapeutic gain is twofold. First, the shift itself is beneficial; second, the patient's sense of mastery over his psychophysiologic condition in the face of painful symptoms is helpful. In this

Table 1

Symptom	Abnormal Function	Feedback Mechanism	Desired Change
Tension Headaches	Scalp and facial muscle tension	Forehead and other muscle, EMG	Relaxation of musculature
Pure migraine	Vascular alterations	Temperature (peripheral blood flow)	Prevention of contraction-dilation cycle
Mixed Tension-migraine headaches	— Combination of both of the above —		
Cardiac arrhythmias	Irregularity of pulse	Pulse	Regularization of pulse
Psychosomatic neck pain	Spasm of neck and shoulder muscles	Trapezius, frontalis, and masseter EMG	Relaxation of muscles
Epilepsy	Abnormal brain waves	EEG	Regularization of EEG

second group, treatment indications include anxiety states, phobic states, sleep onset insomnia and a variety of psychosomatic illnesses, particularly in their early stages.

Specific symptoms which have been treated with biofeedback include:

Headache: Tension and migraine headaches, in pure or mixed forms, are the best established indications for biofeedback therapy.¹⁸ The usual procedure is to begin with relaxation instructions along the lines suggested by Schultz or Jacobson (see above), and to couple these with biofeedback sessions utilizing frontalis electromyographic feedback. During this procedure, the patient hears clicks or tones whose frequency or pitch is directly related to the tension level in the frontalis muscle. The frontalis is accessible, is directly involved in headache production and is also a good reflector of general muscle tension throughout the body.

For most tension headache patients, general deep muscle relaxation and frontalis biofeedback therapy is all that is necessary. If subjective anxiety is present with the tension headache, electromyographic feedback may be followed by alpha-theta electroencephalographic feedback therapy. For migraine and mixed headache patients, electromyographic frontalis feedback must be followed by training on temperature (peripheral blood flow) control.

In the latter procedure, the patient receives auditory or visual feedback which reflects the temperature in his hands, either absolutely or as compared to the temperature of his forehead. This, in turn, is a reflection of his state of peripheral circulation (vasodilatation-warm). As the patient learns through the feedback therapy to raise the temperature of his hand at will (by up to 20°F.), he is able to prevent or abort the vascular component of migraine headaches. Diamond reports 80% success with pure migraine patients and 50% success with mixed and tension headaches. Cluster or allergic headaches thus far have not responded to biofeedback therapy.

Cardiovascular problems: The use of biofeedback in the treatment of cardiac arrhythmias and Raynaud's disease is less well-established, but shows promise. The training procedures vary somewhat, but emphasize direct feedback of the physiologic target parameter. For example, with cardiac arrhythmias, the cardiac rhythm is fed back to the patient. In Raynaud's disease, the peripheral blood flow (temperature) is fed back. Fixed essential hypertension has been reported not to respond, but there is promise that hypertension in the early, labile stage may respond to biofeedback therapy. At this writing, instrumentation for direct blood pressure biofeedback is still limited to research settings, but temperature and GSR feedback, which are clinically available, show preliminary good results.

Epilepsy: Early work with electroencephalographic biofeedback in epileptic patients is promising, though it is too early to be firmly established in the clinical armamentarium, and must be used with great caution (see below).

Physical medicine and rehabilitation: Brudny¹⁹ and others have reported good results in the rehabilitation of patients with upper and lower motor neuron lesions in augmenting and retraining muscle groups previously paretic. He also achieved good results in patients with torticollis.

Psychiatric and psychosomatic indications: Although there has been a flurry or over-optimistic reports in the popular press over the past few years about the use of biofeedback to achieve mind control, tension reduction, creativity, etc. hard clinical reports on the use of biofeedback in psychiatric disorders are just beginning to appear.^{17,20-21} By and large, these reports show promising, but not spectacular, results.

In my opinion, difficulties are more due to the newness of the procedure and the need to develop and refine techniques than to any inherent problems in the basic assumptions. The use of biofeedback in anxiety states seems natural, since anxiety states are

almost always accompanied by some measurable and potentially controllable physiologic parameter, such as increased muscle tension, reduced peripheral blood flow or high frequency, asynchronous muscle tension, reduced peripheral blood flow or high frequency, asynchronous brain waves. However, since none of these constitute the anxious state (as muscle tension constitutes a tension headache, for example) biofeedback therapy is somewhat more complex, involving training for the relaxation response.

Sleep onset insomnia has shown some response to biofeedback treatment.¹⁷ Some unpublished reports²¹⁻²² indicate the usefulness of biofeedback for a variety of early psychosomatic conditions. The response here is mediated via the relaxation response, rather than via direct feedback of the physiologic parameter involved.

Prerequisite for Biofeedback Treatment

For biofeedback therapy to be effective in any of the clinical areas noted above, certain factors must be appreciated and incorporated into the treatment program. These are:

1. Psychophysiologic diagnostic survey and rational construction of biofeedback modalities.
2. Appreciation of strength of the reinforcer (feedback signal) and addition of other positive reinforcers. (That is, proper appreciation and incorporation of placebo effect.)
3. Frequency of the treatment and priority of the treatment.
4. Side effects.

Each of these will now be considered in some detail.

1. Psychophysiologic diagnostic survey. This concept follows Budzynski.²³ This derives from assumption two, under Therapy, "Each person . . ." We have all known patients who respond to nervous tension with functional gastrointestinal systems or clammy hands or rigid, tight, tremulous muscles or excessive sweating or other system-specific manifestations. Utilizing the monitoring capacities of our

various biofeedback equipment, we can target in on the physiologic systems which seem most reactive to stress.

For example, if we discover in a given patient that his hands stay warm during anxiety episodes, it would be useless to train him to increase his peripheral blood flow, because this aspect of his physiology remains "relaxed" even during stress.

An ideal complete psychophysiologic diagnostic survey is clinically unavailable now because techniques for continuous blood pressure and pulse monitoring, for example, are crude, prohibitively expensive and limited to a few experimental laboratories. Nevertheless, electromyography, electroencephalography, peripheral blood flow and galvanic skin response can be measured clinically.

Once a psychophysiologic diagnostic survey is done, the treating physician rationally devises a sequence of biofeedback treatments appropriate for the specific patient. For example, it may seem most useful to begin with electromyographic biofeedback and then to proceed to temperature training, followed finally by electroencephalographic training for alpha or theta. This, in fact, is our most common sequence at the present stage of clinical biofeedback therapy.

2. Recognition of the relative strength of the biofeedback signal as a reinforcer and incorporation of "placebo" effects: Part of the initial enthusiasm about biofeedback derived from animal experiments. It must be kept in mind that in these settings, experimental animals were rewarded with food or stimulation of pleasure centers in the brain, and conversely were punished for undesired performance with, for example, electroshocks. In the clinical setting, of course, our reinforcers for desired behavior are considerably weaker.

Clinically, there are three types of reinforcers, two short-term and one long-term. First is the feedback signal itself. When a patient is hooked up to an electromyographic biofeedback device and

hears clicks whose frequency varies directly with his frontalis muscle tension, he is motivated by his wish to master the art of relaxation toward diminishing the frequency of clicks. However, it must be remembered that this reinforcer alone has nowhere near the power of those used in animal work. Therefore, it is essential to add the second short-term reinforcer—a warm, positive attitude by the therapist. The third, long-term, reinforcer is the patient's hope that he may rid himself of an unpleasant and unhealthy condition, such as anxiety or headache. In addition, all these reinforcers must often work in conjunction with other forms of psychiatric or medical therapy.

Placebo effects in biofeedback have been a subject of controversy. Some studies have shown patients to respond as well if feedback signals are falsified⁷ and others⁶ present evidence that biofeedback effects are no better than placebo effects. My position is that biofeedback can provide necessary, but not sufficient reinforcers for the type of physiologic changes desired. Stroebe²⁴ has shown that if placebo effects are not discarded, but rather are utilized to create an air of mild, though not excessive, optimism, biofeedback treatment works optimally, and our own experience corroborates this. Biofeedback therapy, combined with mild encouragement, home relaxation practice (see below), and possibly other medical or psychiatric treatment modalities, can help significantly in the treatment of certain medical, psychosomatic and psychiatric disorders; but simply hooking a patient up to a biofeedback machine probably won't do much of anything.

3. Frequency and priority of treatment: Once the weakness of the reinforcers (reward and punishment system) in clinical human work is recognized, one can see that patient acceptance of the total biofeedback therapy program—office visits plus home practice—is essential. The patient must practice relaxation techniques conscientiously on his own twice a day (see below) and visit the clinic between

one and three times a week regularly for the first month of therapy. Lack of commitment to this program disqualifies a patient because it signifies considerably decreased chances of success.

4. Side effects and contradictions:²⁵ The relatively benign, non-invasive nature of biofeedback is most appealing. However, certain precautions with regard to side-effects must be observed.

In patients with hypothyroidism and diabetes, successful biofeedback therapy leads to a normalization of function, so that medication levels should be carefully monitored. If this is not done, and medications are kept constant, patients may have hypoglycemic or hyperthyroid episodes.

In patients with impaired cerebral bloodflow (in hypertensives, for example), training directed toward normotension may produce transient cerebral ischaemia.

Occasionally, patients with renal disease have reported kidney pain during biofeedback therapy. Although its meaning and mechanism are not clear, therapy has been stopped.

Cervical spine films should be done prior to instituting biofeedback treatment for torticollis, to assure that straightening of the cervical spine will not aggravate an existing lesion.

Although EEG feedback has been used in the experimental treatment of epilepsy, this should be done only by experienced physicians. Paradoxical responses, with increased seizure activity, are reported.

The possibility exists that suggestible patients may become hyper-suggestible in the relaxation state, though this is by no means proven. To avoid this, the self-mastery and self control aspects of biofeedback should always be emphasized. Also, care should be taken at the end of sessions that patients are back to normal alertness. In an experimental population of college students, Green²⁶ reports that during the first week or two of electroencephalographic feedback, a few subjects felt sluggish, fatigued and nervous, but

these responses were only temporary.

Waste of the patient's time, energy and money are subtle, but none of the less potential, side effects of biofeedback, as of any, therapy. Care must be taken that patients not postpone or neglect indicated medical or surgical treatments.

On the other hand, biofeedback is useful in diminishing side effects of other treatments by reducing need for medication, especially in migraine and sleep-onset insomnia.

Description of Biofeedback Therapy

Our procedures generally follow from the assumptions and positions stated above. They are as follows:

Screening: Patients are referred for general anxiety states or for specific psychophysiologic conditions such as headaches, neurasthenia, psychophysiologic musculoskeletal reactions (neck or back spasm) or psychosomatic conditions associated with subjective anxiety (e.g., peptic ulcer). A history is taken, focusing especially such symptoms as subjective anxiety, peripheral coldness and other physiologic manifestations of psychosomatic disequilibrium. Age of patient and chronicity of symptoms are important. As with most medical treatments, the more recent the symptoms and the younger the patient, the better the prognosis. If the patient is accepted for treatment, he or she is told that the treatment is new and the methods are explained in detail. The vital importance of home practice and keeping office appointments is emphasized. In addition, the issue of passive volition (letting the change happen) versus active volition (trying consciously to make it happen) is discussed in detail.

At the next appointment, a psychophysiologic diagnostic survey is done. Baseline EMG from at least two sites, skin temperature (also from at least two sites) and EEG average amplitude and frequency are all recorded. These data are collected with the patient at rest and then under mild stress. The latter consists of a mental

arithmetic task or imagining a difficult or stressful personal situation.

Based on the history, diagnosis and psychophysiologic survey, a treatment regime is devised. We usually begin with some form of relaxation therapy combined with one of the feedback modalities. Sometimes formal psychotherapy is included.

The patient is instructed in the relaxation therapy chosen and is told to practice at home 15 minutes twice a day. This may consist of a simple instruction to try and relax and sink into the chair (or bed) in a comfortable position, to feel heaviness in the limbs and body, to try to eliminate intruding thoughts and to try and concentrate only on one's breathing. Frequently, however, more elaborate Jacobsonian techniques,¹¹ autogenic phrases,¹⁰ commercially available relaxation tapes²⁷ or tapes made by the therapist are added. If symptoms are severe, patients are required to chart symptom severity²⁸ twice a day. After a few days of home practice, results and problems are reviewed and patients are begun on the biofeedback modality chosen. Thus far, the commonest first modality used is electromyographic feedback.

Feedback sessions are conducted in a small, relatively quiet room whose lighting is kept rather dim. While therapy is done by prescription of and under the supervision of a physician, the actual sessions may be conducted by a physician, psychologist or nurse-therapist. A comfortable lounge-type chair is used by the patient. Sensors from the EMG machine (for example) are attached to the patient and a feedback modality agreeable to him is chosen from among those available on the machinery (clicks, tones or static). These feedback modalities reflect directly the amount of muscle tension. Common sites for recording include frontalis, masseter, trapezius and forearm extensors.

Theoretically, feedback can be obtained from any muscle group in the body, and it is possible to monitor and feedback from four different sites during the same feed-

back session. Auditory tone feedback is supplemented by a visual display meter. At the beginning, middle and end of each session, one-minute averages of electromyographic activity are obtained and recorded by the therapist. It is explained to the patient that the feedback is a direct indicator of general muscle or bodily tension. Patients are instructed to attend only to the relaxation instructions and the feedback noise.

When intruding thoughts occur (as they always do), the patient is told to take a detached attitude as of watching a movie, to let the thoughts drift past and then to return to the relaxation instructions. When autogenic phrases or phrases derived from the relaxation tapes are used, the patient is always reminded to take a passive attitude and let the relaxation occur, rather than actively to **make** it occur. He is also instructed to take a passive attitude towards the auditory feedback itself; that is, he is to allow it to diminish rather than actively to **make** it diminish. When the desired feedback occurs, additional reinforcers (rewards) are given in the form of warm praise from the therapist. If blocks (plateaus or increasing tension) occur, the therapist tries to observe tension points or asks the patient about them.

When the patient masters the electromyogram (on the Autogenic Systems Incorporated EMG 1500 feedback machine which we use in our program, this occurs at approximately .75 microvolts), other reactive systems are frequently introduced, so that the patient may, for example, first relax on the EMG, then learn relaxation of his cardiovascular system by temperature control and finally begin training on the electroencephalographic biofeedback device.

The basic approach on these modalities is the same, but some specifics vary. For example, while working on temperature control, the patient is encouraged to concentrate passively on phrases such as, "My hands and feet are warm" or to visualize their hands in a bucket of warm water. With electroencephalographic training, emphasis shifts to an emptying of the

mind, or to achieve a receptive, "open focus." Three of our patients independently and spontaneously reported that periods of decreased Hertz and increased amplitude on the EEG correlated with a peaceful sense of being aware of the ocean on a warm day.

In the first group of indications discussed above, the goal is to achieve feedback which demonstrates that the patient has voluntary control over the function monitored. Examples are voluntary, consistent achievement of a .75 microvolts (EMG), a finger temperature of 95° or voluntary maintenance of a steady alpha rhythm with eyes open. In the second group of patients described above, the goal is for the patient to respond to internal conflicts or external stresses of whatever source with a voluntarily-induced state of relative calm, tranquility and lowered arousal, i.e., the relaxation response.

After patients have some confidence in their capacity to relax psychophysiologically in the office and during the home practice sessions, they are enjoined to begin using the same relaxation techniques in their everyday lives, particularly when confronted with internal or external disturbing events.

Our team is currently treating approximately 20 patients, about half of whom suffer from anxiety tension states, and the rest from headache, psychophysiologic neck pain or early psychosomatic problems. We hope to report results of this series of patients in the future. At present, we can only present the possibilities and the limitations of this treatment modality.

Doctors in the News

Dr. Nakazawa in Office

Hiroshi Nakazawa, MD of Stevenson, formally assumed the position of President of Baltimore's St. Agnes Hospital Medical Staff recently. Dr. Nakazawa succeeds the

DR. NAKAZAWA

1978 Medical Staff President, Dr. Anthony Hammond of Ellicott City.

Dr. Nakazawa is a member of the Department of Surgery and the Emergency Physician Service, PA at St. Agnes.

Dr. Nakazawa received his Medical Degree from Chiba University School of Medicine in 1955. Following service as an intern in the US Naval Hospital in Yokosuka, Japan, he began additional intern training at St. Agnes, obtaining a residency in surgery which included one year of training at Bon Secours Hospital in Baltimore. Dr. Nakazawa completed his last year of residency as Chief Resident and began practicing general surgery in 1962.

Dr. Nakazawa's involvement in medical and community affairs includes his present position as member of the Board of Directors of the Maryland Foundation for Health Care, Inc. and Med-Chi. He is the

Vice President of Emergency Physician Service, PA, and has formerly served as a member of the Board of Directors of the Baltimore City Medical Society.

Dr. Nakazawa was a member of the Board of Directors of the Maryland Chapter of the American College of Emergency Medicine, and State Chairman of Med-Chi's Medical and Professional Care Committee. He has also served as Chairman of the BCMS Committee of Urban Medical Practice.

Dr. Nakazawa was the Physician Advisor of the Professional Standard Review Organization to St. Agnes Hospital, and is currently a member of the American Medical Association, Med-Chi, the BCMS and the American College of Emergency Physicians. □

Hopkins' Dr. Coyle Wins Major Pharmacology Prize

Joseph T. Coyle, MD, the young Johns Hopkins investigator who developed the first animal model for Huntington's Disease, an inherited brain disorder, has won the

SERIOUS RUNNERS RUN ATHLETIC ATTIC

FOR SERIOUS RUNNERS.

Running is our life. Just as it is yours. We are serious runners. We are Marty Liquori, Greg Fredericks, Ken Schappert, Jeff Howser, Mel Pender, Steve Foster, and many more. In fact, the great majority of our stores are managed by accomplished athletes.

We founded Athletic Attic to provide top quality gear to serious runners like ourselves. And like yourself.

We've been to that breaking point. We've run those hundred mile weeks. So when we select a product for our shelves, we go about it very seriously. And we apply our experience thoroughly.

The result — Athletic Attic consistently has the best selection of running shoes and equipment available anywhere. So if you're serious about running at your best, come to Athletic Attic. We've got what you're looking for. Seriously.

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

1979 John J. Abel Award in Pharmacology. The award, given by the American Society for Pharmacology and Experimental Therapeutics, recognizes outstanding basic research by young scientists, and was presented at the Society's meeting in Dallas recently.

Also honored by the Society for outstanding research was **Thomas H. Maren, MD**, Graduate Research Professor of the Department of Pharmacology at the University of Florida College of Medicine in Gainesville. The Society honored him with the second Theodore Weicker Memorial Award, which recognizes sustained, distinguished contributions in pharmacology. Both Dr. Coyle and Dr. Maren are alumni of the Johns Hopkins School of Medicine. The first Weicker Award went last year to Hopkins Professor **Ernest Bueding, MD**.

Dr. Coyle, 35, has focused his work on chemicals in the brain which transmit messages from one nerve to another. These chemicals, called neurotransmitters, are the language by which neurons communicate among themselves and thus mediate the processes of thought, emotion, movement and sensation. Dr. Coyle's investigations of brain neurotransmitters led to the discovery of an animal model of Huntington's Disease, the tragic, inherited, neurological disorder whose most well-known victim was the late folksinger Woodie Guthrie.

While there is no current treatment to halt the progression of the disease, an animal model provides scientists with a means to study the processes in the brain which cause the jerking movements and mental deterioration characteristic

of Huntington's. Dr. Coyle discovered that a drug, kainic acid, when injected in microscopic amounts into the part of a rat's brain called the basal ganglia, upsets the ratio of neurotransmitters, causing Huntington-like symptoms and the same kind of cell death which occurs in Huntington's. This exquisitely-specific method of killing brain cells not only has provided a technique to study Huntington's, but Dr. Coyle has gone on to demonstrate other uses of kainic acid in inducing brain lesions. Scientists now use microinjections of kainic acid in other parts of the brain to study different neurotransmitter processes, thus widening understanding of basic neurochemical processes in various parts of the brain.

Dr. Coyle is also investigating nerve cell growth in the developing brain. Different types of nerve calls vary in the substances they use as neurotransmitters, and Dr. Coyle has focused on neurons which use dopamine as a neurotransmitter. Disturbances of the dopamine system within the brain are implicated in Huntington's, Parkinson's disease, schizophrenia, certain birth defects of nervous function, as well as childhood behavioral and learning disabilities of unknown origin.

"The mature nervous system is a poor model for understanding congenital nervous disorders," Dr. Coyle says, "because growing nerves may behave quite differently from mature ones, and each stage of nerve development may be affected by events occurring at earlier periods. For example, there is evidence that development of neurons may be guided during early brain growth by neurotransmitters re-

leased from neighboring cells."

Better understanding of how this important class of nerves develops is essential to learning how genetic defects or environmental agents may cause maldevelopment, and to future attempts to devise means of prevention or treatment, according to Dr. Coyle.

A 1969 graduate of the Johns Hopkins School of Medicine, Dr. Coyle is married to the former Genevieve Sansoucy, and they have three sons. Following an internship in pediatrics at the Johns Hopkins Hospital, he took a three-year fellowship at the National Institute of Mental Health with Nobel Prize-winner Dr. **Julius Axelrod**. He then completed a residency in psychiatry at Johns Hopkins. During medical school, he worked in the laboratory of Dr. **Solomon Snyder**, a former Abel Award-winner. Dr. Coyle joined the faculty as Assistant Professor in Pharmacology in 1974, working in the psychopharmacology group headed by Dr. Snyder. A practicing psychiatrist, Dr. Coyle also co-directs the Outpatient Pharmacotherapy Clinic at the Phipps Psychiatric Clinic. He was promoted to Associate Professor of pharmacology and psychiatry at Hopkins in 1978.

Dr. Maren, this year's Weicker Award winner, is a 1951 graduate of the Hopkins School of Medicine. He has demonstrated the important and ubiquitous role of the enzyme carbonic anhydrase in regulating fluid secretion in various body systems, including the brain, gastrointestinal tract, kidney and eye. In studies extending over 30 years, he has translated basic biochemical and pharmacologic observations to clinical treatment. □

Hopkins Special Handgun Control Meeting

A special meeting on handgun control was held recently in the Turner Auditorium of the Johns Hopkins Medical Institutions in Baltimore.

Pete Shields, President and Chairman of Handgun Control, Inc., discussed the lack of progress on handgun control and what must be done to promote passage of appropriate national legislation. Johns Hopkins University President Emeritus Milton Eisenhower, who headed the National Commission on the Causes and Prevention of Violence, also spoke.

Shields became an advocate for handgun control following his son's murder in 1974 by San Francisco's so-called "Zebra Killer." He quit his job of 22 years at DuPont Chemical and joined the fledgling Washington, DC-based organization which he now heads. Handgun Control, Inc., is pressing for national legislation to control, but not ban, handgun use.

"Recognizing that there are 50,000,00 handguns out there in private hands, a ban is neither politically nor practically possible," Shields says, "but there is wide public support for measures which could effectively reduce the reckless and criminal use of handguns." Sen. Edward Kennedy (D-MA), Chairman of the Senate Judiciary Committee, is expected to introduce some handgun control measures soon.

Six bills to restrict handgun use in Maryland received strong support when Richard S. Ross, MD, Dean of the Hopkins School of Medicine, led a delegation of Hopkins doctors to Annapolis, where they testified on handgun control as a public health measure before the State Senate Judicial Proceedings Committee. Dr. Ross pointed out that firearms are the leading cause of death for non-white males aged 15-39. Edyth Schoenrich, MD, Associate Dean of the School of Hygiene and Public Health, added that "If there were some disease doing what handguns do, there would be an outcry to deal with it." A week later, all six bills died in committee, despite strong editorial support from the media. □

Fellowships Granted by the American College of Cardiology

The 9,500-member American College of Cardiology, national medical specialty society for specialists in cardiovascular diseases, has announced the names of physicians and surgeons recently admitted to Fellowship in the College.

Local governors, representing the College in each state and Canadian province have released the list of organizational members who recently have achieved the Fellowship category.

The new Fellows have fulfilled stringent membership requirements based on several years of practice and specialty certification. This evidence of qualification is augmented by recommendations from colleagues that show the candidate has attained a high standard in his/her community as a specialist or consultant in cardiovascular diseases or in an allied specialty.

The Bethesda-based American College of Cardiology was founded

three decades ago with the prime purpose of promoting and developing the life sciences pertaining to the circulatory system in health and disease. The College publishes a monthly journal, holds national conferences, designs and administers educational programs and encourages research.

In 1977, it opened a modern Learning Center and administrative headquarters in Bethesda to further its ongoing efforts in CME.

Bernadine H. Bulkley, MD, of Baltimore, ACC Governor for Maryland, announced that the following cardiovascular specialists in her geographic area have achieved the ACC's membership rank of Fellowship: Stephen C. Achuff, MD, Baltimore; Harris M. Kenner, MD, Bethesda and Keith M. Lindgren, MD, Takoma Park. □

SPECIAL NOTICE ABOUT WILL PREPARATION AND ESTATE PLANNING FOR ALUMNI AND FRIENDS OF THE UNIVERSITY OF MARYLAND AT BALTIMORE AND UNIVERSITY HOSPITAL

A bequest provision or the establishment of a deferred gift for any of its components may earn special recognition from the University during the alumni or friend-benefactor's lifetime.

With a \$30,000-or-more bequest or deferred gift, the donor becomes part of the University forever. This planned giving leads to the same permanent acknowledgement as an outright gift of \$10,000 in a lump sum or a pledge of \$1,000 a year for ten years.

The University of Maryland system provides perpetual recognition through its Presidents Club. At the Baltimore City Campus the gift is acknowledged similarly by the Dental School, School of Law, School of Medicine, School of Nursing, School of Pharmacy, School of Social Work & Community Planning and University Hospital.

Alumni and friends of the Baltimore City Campus of the University may obtain Presidents Club and other recognition for their bequest provision or establishment of a deferred gift by contacting the Office of Development and Planning, University of Maryland at Baltimore, 14-021, Howard Hall Tower, Baltimore, Maryland 21201, (301) 528-7398.

For recurrent attacks of urinary tract infection in women

Bactrim™ DS Double Strength Tablets

Each tablet contains 160 mg trimethoprim and 800 mg sulfamethoxazole.

Just one tablet b.i.d. for 10 to 14 days

- Action at urinary/vaginal/lower bowel sites helps eliminate reservoirs of infecting organisms
- Distinctive antibacterial action plus wide spectrum helps eradicate recurrent UTI
- Low incidence of bacterial resistance in community practice

- Convenient *b.i.d.* dosage provides day-and-night antibacterial control
- Contraindicated during pregnancy and the nursing period. During therapy, maintain adequate fluid intake; perform CBC's and urinalyses with microscopic examination.

Before prescribing, please consult complete product information, a summary of which follows:

Indications and Usage: For the treatment of urinary tract infections due to susceptible strains of the following organisms: *Escherichia coli*, *Klebsiella-Enterobacter*, *Proteus mirabilis*, *Proteus vulgaris*, *Proteus morganii*. It is recommended that initial episodes of uncomplicated urinary tract infections be treated with a single effective antibacterial agent rather than the combination. Note: The increasing frequency of resistant organisms limits the usefulness of all antibacterials, especially in these urinary tract infections.

Also for the treatment of documented *Pneumocystis carinii* pneumonitis. To date, this drug has been tested only in patients 9 months to 16 years of age who were immunosuppressed by cancer therapy.

The recommended quantitative disc susceptibility method (*Federal Register*, 37:20527-20529, 1972) may be used to estimate bacterial susceptibility to Bactrim. A laboratory report of "Susceptible to trimethoprim-sulfamethoxazole" indicates an infection likely to respond to Bactrim therapy. If infection is confined to the urine, "Intermediate susceptibility" also indicates a likely response. "Resistant" indicates that response is unlikely.

Contraindications: Hypersensitivity to trimethoprim or sulfonamides; pregnancy; nursing mothers; infants less than two months of age.

Warnings: Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been associated with sulfonamides. Experience with trimethoprim is much more limited but occasional interference with hematopoiesis has been reported as well as an increased incidence of thrombopenia with purpura in elderly patients on certain diuretics, primarily thiazides. Sore throat, fever, pallor, purpura or jaundice may be early signs of serious blood disorders. Frequent CBC's are recommended; therapy should be discontinued if a significantly reduced count of any formed blood element is noted.

Precautions: Use cautiously in patients with impaired renal or hepatic function, possible folate deficiency, severe allergy or bronchial asthma. In patients with glucose-6-phosphate dehydrogenase deficiency, hemolysis, frequently dose-related, may occur. During therapy, maintain adequate fluid intake and perform frequent urinalyses, with careful microscopic examination, and renal function tests, particularly where there is impaired renal function.

Adverse Reactions: All major reactions to sulfonamides and trimethoprim are included, even if not reported with Bactrim. **Blood dyscrasias:** Agranulocytosis, aplastic anemia, megaloblastic anemia, thrombopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia. **Allergic reactions:** Erythema multiforme, Stevens-Johnson syndrome, generalized skin eruptions, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis. **Gastrointestinal reactions:** Glossitis, stomatitis, nausea, emesis, abdominal pains, hepatitis, diarrhea and pancreatitis. **CNS reactions:** Headache,

peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo, insomnia, apathy, fatigue, muscle weakness and nervousness. **Miscellaneous reactions:** Drug fever, chills, toxic nephrosis with oliguria and anuria, periarteritis nodosa and L. E. phenomenon. Due to certain chemical similarities to some goitrogens, diuretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused rare instances of goiter production, diuresis and hypoglycemia in patients; cross-sensitivity with these agents may exist. In rats, long-term therapy with sulfonamides has produced thyroid malignancies.

Dosage: Not recommended for infants less than two months of age.

Urinary Tract Infections: Usual adult dosage—1 DS tablet (double strength), 2 tablets (single strength) or 4 teasp. (20 ml) b.i.d. for 10-14 days.

Recommended dosage for children—8 mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses for 10 days. A guide follows:

Children two months of age or older:

Weight		Dose—every 12 hours	
lbs	kgs	Teaspoonfuls	Tablets
20	9	1 teasp. (5 ml)	½ tablet
40	18	2 teasp. (10 ml)	1 tablet
60	27	3 teasp. (15 ml)	1½ tablets
80	36	4 teasp. (20 ml)	2 tablets or 1 DS tablet

For patients with renal impairment:

Creatinine Clearance (ml/min)	Recommended Dosage Regimen
Above 30	Usual standard regimen
15-30	½ the usual regimen
Below 15	Use not recommended

***Pneumocystis carinii* pneumonitis:** Recommended dosage: 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

Supplied: Double Strength (DS) tablets, each containing 160 mg trimethoprim and 800 mg sulfamethoxazole, bottles of 100; Tel-E-Dose® packages of 100. Tablets, each containing 80 mg trimethoprim and 400 mg sulfamethoxazole—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 40, available singly and in trays of 10. Oral suspension, containing in each teaspoonful (5 ml) the equivalent of 40 mg trimethoprim and 200 mg sulfamethoxazole, fruit-licorice flavored—bottles of 16 oz (1 pint).

Her next attack of cystitis may require

the BactrimTM 3-system counterattack

ROCHE

Bactrim has shown high clinical effectiveness in recurrent cystitis as a result of its wide spectrum and distinctive antimicrobial action in the urinary, vaginal and lower intestinal tracts.

The probability of recurrent urinary tract infection appears to be enhanced by the establishment of large numbers of *E. coli* or other urinary pathogens on the vaginal introitus. The trimethoprim component of

Bactrim diffuses into vaginal fluid in effective concentrations, thus combating migration of pathogens into the urethra.

Studies have shown that Bactrim acts against *Enterobacteriaceae* in the bowel without the emergence of resistant organisms. Thus, Bactrim reduces the risk of introital colonization by fecal uropathogens. It has *no* significant effect on other normal, necessary intestinal flora.

Bactrim fights uropathogens in the urinary tract/vaginal tract/lower intestinal tract

Please see reverse side for summary of product information.

Managers.

Are Billing and Receivables Important to You?

CAS means: **effective patient** **account management**

CAS Provides a "Results" System Tailored to Your Needs

- is designed specifically for group practice management needs;
- is user-controlled and directed for assured accuracy and efficiency;
- can be effectively operated by non-technical administrative personnel;
- provides fast, accurate, reliable billing to all parties;
- provides automatic rebilling and collection follow-up;
- issues timely and effective practice activity reports;
- is kept up-to-date by professional group practice managers;
- improves cash flow;
- increases total collections;
- is fully confidential.

CAS' Staff are experienced Group Practice Managers! We are available for management consultation. We monitor the business practice issues especially those related to third party payors and government units. This monitoring makes it possible for CAS to implement carefully thought-out plans rather than reacting to unnecessary crises.

Our pricing structure is based on our performance and is very competitive; you only pay for the bills, statements and reports produced. We depend on our performance which assures you

peace-of-mind. The CAS System pays for itself!

Headquartered in Baltimore, CAS effectively serves this region by providing its computerized system as a tool for your management or by providing total patient account management services.

For the best results from patient account management, enter into a CAS partnership. Call or write for a free brochure.

I would like more information about how CAS can make my patient account management task easier:

- ☐ Have someone call to discuss my requirements.
☐ Send me more information.

Ask for Kenneth Brown, Vice President

A character all its own.

Valium (diazepam/Roche) is a benzodiazepine with a character all its own.

Pharmacologically, it is a potent skeletal muscle relaxant and anticonvulsant (in adjunctive use), as well as an antianxiety agent. Pharmacokinetically, only Valium provides active diazepam as well as the active metabolites 3-hydroxydiazepam, desmethyldiazepam and oxazepam.

But the individual character of Valium is even more apparent clinically than pharmacokinetically. And far more significant. That's because of the patient response obtained with Valium. A response which brings a calmer frame of mind. A response which has a pronounced effect on the somatic symptoms of anxiety, particularly muscular tension. A response which helps the patient feel more like himself again because of the way Valium reduces the overwhelming symptoms of anxiety and psychic tension.

Another important aspect of the clinical character of Valium is safety. Though drowsiness, ataxia and fatigue are possible, these and more serious side effects are rarely a problem. Of course, as with all CNS-acting drugs, patients taking Valium should be cautioned against driving, operating dangerous machinery or the simultaneous ingestion of alcohol.

Unquestionably, many psychotherapeutic agents, including other benzodiazepines, have antianxiety effects. But one fact remains: you get a certain kind of patient response with Valium. It's a response you want. A response you know. A response you trust as part of your overall management of anxiety and psychic tension.

Valium[®] ^{IV}
diazepam/Roche
2-mg, 5-mg, 10-mg scored tablets
**a prudent choice in psychic
tension and anxiety**

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology; spasticity caused by upper motor neuron disorders; athetosis; stiff-man syndrome; convulsive disorders (not for sole therapy).

The effectiveness of Valium (diazepam/Roche) in long-term use, that is, more than 4 months, has not been assessed by systematic clinical studies. The physician should periodically reassess the usefulness of the drug for the individual patient.

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium[®] (diazepam) Tablets, 2 mg, 5 mg and 10 mg—bottles of 100 and 500; Tel-E-Dose[®] packages of 100, available in trays of 4 reverse-numbered boxes of 25, and in boxes containing 10 strips of 10; Prescription Paks of 50, available singly and in trays of 10.

The Maker

Examining a Few Myths About Prescribing.

Increasing pressure is being put on the practicing physician to prescribe drugs generically. You are told that brand-name products are universally "expensive" and generic versions are relatively "cheap." To make this case, the most extreme (rather than typical) price differentials are cited. Thus, consumers are led to believe that such differentials are commonplace. Even your knowledge and your motives as a physician are questioned.

Understandably, these views have created myths. We think it's time to examine them in the light of all the facts and ramifications.

MYTH: There are no differences in quality and performance between brand-name products and their generic counterparts. The corollary is that there are no differences among products made by high-technology, quality-conscious, research-based companies and those made by commodity-type suppliers.

FACT: The Food and Drug Administration does a good job in monitoring a generally excellent drug supply. Still, it has nowhere near the resources to guarantee the quality and bioavailability of all marketed products at any given time. Just a few months ago, for example, it noted that batches of tetracycline HCl capsules which met official monograph requirements were

not bioequivalent to a reference product. As you know, there is substantial literature on this subject affecting many drugs, including such antibiotics as tetracycline and erythromycin. The record on drug recalls and court actions affirms strongly that there are differences among pharmaceutical companies and their products. Research-intensive companies have far better records than those that do no research and may practice minimum quality assurance.

MYTH: Industry favors only "expensive" brand names and denigrates all generics.

FACT: PMA companies make 90 to 95 percent of the drug supply, including, therefore, most of the generics. Drug nomenclature is not the important point; it's the competence of the manufacturer and the integrity of the product that count.

Matters.

MYTH: Generic options almost always exist.

FACT: About 55 percent of prescription drug expenditure is for single-source drugs. This means, of course, that for only 45 percent of such expenditure, is a generic prescribing option available.

MYTH: Generic prescriptions are filled with inexpensive generics, thus saving consumers' large sums of money.

FACT: Market data show that you invariably prescribe—and pharmacists dispense—both brand and generically labeled products from known and trusted sources, in the best interest of patients. In most cases the patient receives a proven brand product. Savings from voluntary or mandated generic prescribing are grossly exaggerated.

MYTH: Drugs account for a major portion of the rise in health care costs.

FACT: Drugs represent a very small part of such costs. The amount of the health care dollar spent for prescription drugs was about 12 cents in 1967; today it is about 8 cents. And you as a physician are most conscious of how drug therapy can cut hospitalization, avert surgery, reduce office visits and keep patients on the job.

MYTH: Government intrusions into the marketplace will save tax money.

FACT: Government schemes always cost the taxpayer something, and the costs often exceed the benefits. Certainly, any federal "help," such as lists of wholesale drug prices sent to all physicians and pharmacists, will be no exception. Just think of the expense of keeping them current! Moreover, wholesale prices are poor guides to actual transaction prices and even worse guides to retail prices.

The PMA Position

We believe your freedom to prescribe, either by generic or brand name, should be totally unabridged. Otherwise, your prescribing prerogatives and your relationships with patients will be seriously impaired.

The maker does matter

After the myths about price and equivalency have been shattered, one fact stands out more clearly than ever: *The maker does matter.* As always, your best guide to drug therapy for your patients is to select products—both brands and generics—from manufacturers with credentials and performance records you have come to respect.

The logo for the Pharmaceutical Manufacturers Association (PMA) consists of the letters 'PMA' in a bold, stylized, serif font. The 'P' and 'M' are connected, and the 'A' is separate.

Heat Hazards

Thermostats in working areas of government office buildings will be turned to 80° this summer. Workers and people in general will be exposed to hot and humid weather conditions. It is important to plan for preventive programs against heat exposure. Three objectives of such a program are: 1) to prevent clinical disorders from the heat; 2) to prevent aggravation of existing medical conditions by the heat and 3) to maintain optimum health and work efficiency of employees.

Immediate action can be taken by:

1. assigning physically-less demanding tasks or tasks involving reduced heat exposure;
2. giving more frequent job breaks;
3. increasing the use of air-circulating devices;
4. providing shaded or heat adjusted rest areas;
5. allowing appropriate clothing;
6. training supervisors and employees in the medical effects of exposure to hot temperatures. There are four medical conditions which are the effects of heat exposure:

a. *Heat Exhaustion* is characterized by giddiness and fainting following standing or sudden change in posture or exercise in hot weather. It can be due to the peripheral pooling of blood and hypotension.

REMEDY: Replace perspired water and salt and remove the person to a cooler environment.

b. *Heat Cramps* occur in the skeletal muscles used in hot weather. The cramps are painful and spasmodic. The skin is usually hot and moist.

REMEDY: Replace perspired water and salt and remove the person to a cooler environment.

c. *Heat Stroke* is an emergency situation which results from prolonged exposure to hot temperatures. It is more serious than heat exhaustion or heat cramps. Persons with heat stroke often collapse without warning. They can be delirious, have convulsions or be in a coma. The skin is hot and dry, sweating has stopped. Body temperature can be as high as 104° to 106°F.

REMEDY: Immediately call ambulance and begin bringing the body temperature down as quickly as possible by applying a cold water bath with vigorous fanning. The person should be transported to a medical facility.

d. *Heat Rash* or prickly heat is a skin condition involving the sweat glands and prolonged ex-

posure to evaporated sweat. It is recognized as tiny red raised vesicles.

REMEDY: Wash and dry the skin thoroughly, apply talc or other drying agent.

7. The use of salt tablets without medical supervision is not recommended and
8. Preemployment physical exams should include an adequate history of tolerance to heat on and off the job. Heat tolerance and physical work capacity decrease with age.

Acclimatization to hot humid weather may take from a few days to several months. Persons must be alerted to the complications associated with hot weather and consider the preventive measures with which can be taken.

An American Company

Baltimore City Medical Society

CONRAD ACTON, MD, Editor

April Meeting

Amid the clatter of oyster shells, there was a larger than usual attendance at the April, 1979 regular meeting. Bivalves mean much to Baltimoreans!

Edmund Beacham, MD, Chairman of the Tellers, reported the election of four members to be our Councilors for the Med-Chi Faculty Council: *Ian R. Anderson, MD; John B. DeHoff, MD; William G. Helfrich, MD* and *Karl H. Weaver, MD*. Later it developed that BCMS is entitled only to three Councilors. There will be a run-off, as two were tied.

Reports

Ian R. Anderson, MD, Chairman of the Legislative Committee, briefly reported on outcome of bills of medical interest in the recent Legislature. Most of the major bills favored by the BCMS and Med-Chi were passed.

Paul Bormel, MD, President of the BCMS Foundation, reported that the Doctors' Day Dinner Dance was a success to the degree that \$1,400 was raised. He thanked the Auxiliary and the Society's staff for making it possible and worthwhile.

President Antlitz announced that Dr. Huang Chia-ssu, President the Chinese Academy of Medicine in Peking, will give a talk to the physicians of Maryland on May 13th. He is American-trained and also Editor of the English edition of the *Chinese Medical Journal*.

Walter Kohn, MD, was memorialized by John Hirschfeld, MD for long service in the community and devotion to his patients. Dr. Kohn died of a heart attack while giving CPR to a patient who collapsed in his office.

Dr. Fortuin Speaks

Exercise Therapy and Testing: Pro and Con was the evening's scientific subject. Nicholas J. Fortuin, MD, Professor of Medicine at Hopkins Medical School, started with a consideration of jogging. In his unstructured presentation, he noted that even the Blues were currently picturing a jogger in their advertisements as a symbol of health and quoted from the ancient Greek (I think Socrates) in favor of exercise. Why jogging is so much of a cult today is problematic and may rest on a number of factors. There is an admitted 'high' that jogging seems to bring along with second wind. Superstitions that "joggers never die" are passed on from jogger to jogger.

Demonstrable beneficial effects are an increased number of myocardial capillaries, increased lung capacity, fewer MIs and psychological well-being.

Greenspring In Beautiful Greenspring Valley

... a community where anything is possible so long as quality and imagination are paramount. The custom homes built here reflect the ambience one would expect in so fine a location.

We have the experience, the craft and the ability to make your dream a reality. Whether you allow us to suggest a design or work directly from yours, the result will be the ultimate expression of your own personality and life style.

Visit us and examine the 2 to 6 acre homesites in Maryland's most beautiful valley. GREENSPRING, is only minutes away from bustling Baltimore. The Beltway and Jones Falls Expressway are close enough to be convenient, far enough to be secluded.

Come and see the 2 to 6 acre homesites and make GREENSPRING your permanent address. Open daily 12-5 or by appointment.

Call Jim Hebb 301-825-6600 or 301-484-8018

From Baltimore Beltway North on Falls Road, left on Greenspring Valley Road, approximately 1-1/2 miles, opposite Villa Julie College.

TALK TO STEFFEY
Realtors since 1915

Jogging has disadvantages too. Sudden death while jogging is not unknown. Orthopedic problems may be worsened or created. Possible mechanical injury by collision or fall may happen. Costs in time and equipment can often be considerable.

Dr. Fortuin considers stress testing very nonspecific. The Masters test is now quite obsolete. Submaximal and maximal testing with bicycle or treadmill can give useful information. In terms of ST changes he warned that false positives or negatives are possible. When compared with X-ray studies as to specificity, sensitivity and predictability, the stress test has its own validity. Normal and abnormal findings by either/both methods do not necessarily exclude the other's results.

Board of Directors Meets

The Board of Directors met Apr. 17th and had a long agenda which, after a brown bag type of supper, was largely repeated with the BCMS Delegates, Alternates and Councilors.

The Legislative Committee reported its evaluation of the actions taken by the State Legislature on bills of importance to Medicine. HB-637 was enacted requiring hospitals to provide staff privileges to non-medical doctors. The Committee urged writing to the Governor urging him to use his veto power. It poses legal complexities with JCAH accreditations, increased costs of care and mounting malpractice costs.

SB-780 would have prevented the HSCRC from controlling physicians. It was defeated. It is problematical, the Committee holds, whether the HSCRC has shown any actual effectiveness in controlling even hospital costs in Maryland. The only statistics supplied

are their own; therefore, the Committee recommends that an independent analyst be employed to determine whether or not there may have been any cost-savings attributable directly to the Health Services Cost Review Commission. This idea was referred to the Policy and Planning Committee, broadened to include the question of what more the BCMS should do with regard to the cost of medical care.

Myron M. Levine, MD, Chairman of the Public Health Committee, brought a request from his Committee for a name change. The designation of the Subcommittee on High School Athletics does not describe the scope of work done and could be turning off physicians who might participate. The title Subcommittee on Physical Fitness and Sports Medicine is in keeping with the broadening area of its actual activities. The Directors agreed and some publicity will be given in the *Newsletter*.

Dr. Heldrich Reports

Fred J. Heldrich, MD, Chairman of the Professional Education Committee, was present to give a lengthy report. He summarized membership response to questionnaires sent out in the *Newsletter*. These he could compare to replies regarding similar topics from several other medical societies. Some of them were larger, some smaller and some the same size as ours. After analysis, the Committee recommended five changes. These were for reduction of the number of meetings to five, deletion of the requirement for scientific program, (with or without Brownie points), for program of general interest, development of an alternate way of electing members and to ensure membership voice

These Pagers Mean Business.

Renting A Beeper?

A significant portion of your monthly charge is for equipment — **not** the actual paging. The rental price includes equipment, paging and maintenance.

Ownership Reduces Monthly Charges

The most practical solution to lowering the monthly charge for paging is to supply your own equipment. In this manner you can save up to \$13.50 **each** month! Coverage and convenience remain the same.

Choosing Your Communications Supplier

Evaluate total costs — purchase price **and** maintenance. Every pager sold by Mountainside has a 3 year parts and labor warranty, assuring you of no hidden extra charges. Whatever your paging needs, whichever features you require, they are available with our equipment.

in Society affairs with respect to submitting Resolutions. This was referred to the Bylaws Committee for implementation.

Dr. Antlitz Talks

President Antlitz reported that the Med-Chi Council was opposed to our Primary Care Study in principle and refused to assist its funding. Dr. Kassel reiterated that the study is for the protection and benefit of the private practitioners in primary care. Government planning of the funding for primary care is based entirely on statistics from hospital, institutional and governmental sources. This is because "data from the private sector is too hard to get". Our Primary Care Study is proposed to give the private sector an equal input to the planning process with the public providers and balance out the costing between them into a more valid and viable result. □

Executive Director's Newsletter

August, 1979

GASOLINE

The Faculty has been active during the past several weeks in attempts to relieve the gasoline shortage for physicians.

SHORTAGE

It was instrumental in prior years in exempting physicians from the odd-even system of gasoline purchases. This method is also one used by the present Governor.

In addition, the Faculty has been able to obtain special allocations of gasoline supplies by working through component medical societies. The main problem in this area is that a storage facility must be obtained for these special fuel allocations.

Some societies have obtained regular gasoline stations to set aside one fuel tank for physician use, and gasoline has been allocated for dispensing to physicians under the control of the local medical society.

In Montgomery and Charles Counties, local station dealers are handling and storing the supply for physicians. In Prince George's County, two private hospitals have gasoline tanks available on their property and these facilities are being used.

Any inquiries on gasoline needs should be addressed to Michael A. Murray, Assistant Executive Director, at the Faculty office.

In a related area, the State Energy Office has advised its definition of an emergency situation:

"This will have to be left up to the good judgment of the service station owner. Obviously, if a person must be taken to a hospital or a car which has run out of motor fuel must be removed from the middle of a highway, gas should be supplied regardless of the date. Other similar emergency situations will arise and the service station owner will have to use his good judgment. The Governor has directed that when a service station owner acts in good faith in what he sees as an emergency, no one is to be prosecuted."

EXEMPTION TO HEATING AND COOLING CONTROLS

Physicians' offices are exempted from the requirement on heating and cooling controls for temperatures. The maximum winter temperature for heating has been set at 65 degrees F., and for summer, 78 degrees F.

CPT-4 Physicians and others in Maryland have purchased over 4,000 CPT-4s for use in billing insurance carriers, including those SUPPLEMENTS bills for Medicaid patients. Included in each of these books is a postal card to be mailed for obtaining supplements to the publication as they are issued.

The AMA has advised the third update to this is now available. They are mailed automatically if the postal card contained in the back cover of the CPT-4 book is mailed in. Physicians and others are reminded to do this.

SEMIANNUAL Material should have been received by all physicians on the MEETING Semiannual Meeting which is set for New Orleans, September 12 through 16, 1979. If you have misplaced this, copies can be obtained through the Faculty office.

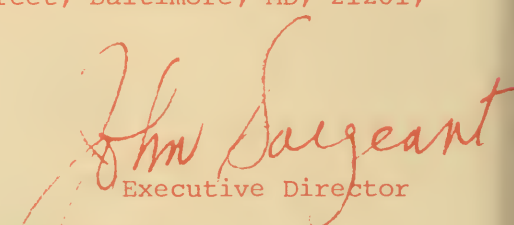

BUSINESS Business sessions for the Semiannual Meeting will be held on SESSIONS Saturday, September 29, 1979, at the Faculty Building. The House of Delegates is scheduled to commence at 2 PM that day.

Resolutions for consideration at this session must be in the Faculty office by the close of business on Friday, August 3, 1979. The Bylaws require that all such resolutions be received at least 8 weeks prior to the House of Delegates sessions.

PRIMARY Physician participation in the State Early and Periodic Screen- CARE ing, Diagnosis and Treatment (EPSDT) Program is being expanded to the private sector by the Medicaid program. If any physi- PHYSICIANS cian is interested in participating, he should contact the Medicaid staff specialist assigned to this activity at (301) 383-2658. All physicians should have received the State Department of Health and Mental Hygiene bulletin on this subject dated June 19, 1979.

PHYSICIANS The Health Claims Arbitration Office is in need of physicians NEEDED in all specialties to serve on the arbitration panels. The vast majority of cases heard are against physicians. Where IMMEDIATELY no physician is available to serve as part of the panel, other health professionals are used.

To volunteer your services, contact the Health Claims Arbitration Office, 201 West Preston Street, Baltimore, MD, 21201, (301) 383-3910.

Yours Truly™ by Jobst® – it's only natural.

Finally, a truly natural external breast prosthesis is available to your patients. No need to follow the trauma of a radical mastectomy and associated psychological overlay with an ugly, even grotesque breast prosthesis of unnatural polyvinyl chloride.

Now, with the help of your nurse, Reach to Recovery volunteers, and others, you can suggest to your postmastectomy patients an external breast form that is seamless and natural. The Yours Truly™ breast form is new. Worn right against the skin it requires no special bra to stay in place. It moves with the vitality and flow of a natural breast. The silicone gel inside has a specific gravity of .98, only .04 more dense than human breast tissue and the response in vivo is nearly identical. There are thirteen sizes from which to choose, each with the contour and suppleness of the female breast size it replaces.

Contact your local Jobst Service Center for complete details.

JOHN SARGEANT, CAE, Executive Director

Council

The Council met on June 21, 1979 and took the following actions:

1. Rejected a proposed resolution dealing with Medicaid patients that originated in the Liason Committee.
2. Authorized a public speaking training session sponsored by the Legislative Committee to train speakers appearing before General Assembly Legislative meetings.
3. Endorsed the concept of Hospice care for Maryland citizens, and also endorsed a Certificate of Need Application for a proposed hospice program to be offered jointly by the Baltimore City Health Department and the Deaton Medical Center.
4. Adopted a standing policy that the Auxiliary President and the Public Relations Committee Chairman be invited to Council sessions.
5. Endorsed in principle a proposed study of Primary Care Physicians in Baltimore but declined to participate financially in such study.
6. Approved an Executive Committee recommendation for purchase of a computer and related services (software and training package).

7. Adopted and referred to the Bylaws Committee the following recommendation of the Policy and Planning Committee, with instructions that bylaw amendments be prepared for submission to the 1979 House of Delegates Semiannual Session:

"The budget for a succeeding year should be developed each summer and presented to the Semiannual Meeting for its approval. The budget would be explained in detail and questions would be responded to by the Treasurer, a Budget Committee or other officers of the Faculty, at this meeting. Copies would have been mailed well in advance of the Semiannual Meeting to all Delegates, Alternate Delegates and Component Society officers. Should individual component societies wish to have a visit from a Faculty Officer or Budget Committee member, this should be encouraged.

In addition, encouragement should be given to component societies to attend the budget setting meetings, which is current practice. This would enable Component Society officials to be aware of the detail and minutiae that goes into budget preparation and allow them to become fully-acquainted with the various items that make up the totals of line items.

Once the budget has been approved by the Semiannual Meeting of the House of Delegates, dues would be determined, rounding them to the next highest \$5 by dividing the number of active members into the

total budget. Dues bills would then be prepared on this basis.

The Policy and Planning Committee feels this will accomplish meeting the needs of Faculty members, as Federal and other programs flourish and the necessity to respond to such Federal and State governmental actions becomes evident. This would also prevent any deficit budgets taking place on periodic occasions.

This change should be effected by the Bylaws Committee as promptly as possible so such bylaws can be approved at the 1979 Semiannual Meeting and actions taken for implementation of this proposal with the 1981 budget. It will obviously be too late to implement such a program for the 1980 budget, because of bylaw problems and constraints."

8. Adopted the following recommendations of the Policy and Planning Committee, after amending them, all of which read as follows:

RESOLVED, that social and scientific portions of the Semiannual Meetings be held inside Maryland at least every other year.

RESOLVED, that sites for Semiannual Meetings be selected a minimum of four years in advance of the meeting dates, such sites to be selected by the Program and Arrangements Committee and recommended to the Council, as provided for in the bylaws.

RESOLVED, that the Program and Arrangements Committee is authorized to determine the most appropriate manner of handling arrangements for scientific and social portions of the Semiannual Sessions held outside of the state and make appropriate proposals to the Council as required by the bylaws in this regard.

RESOLVED, that the Chairperson and one staff person be authorized to make site visits to appropriate locations after the site has been approved by the Council, and it is necessary to review the facilities for efficient and appropriate functioning of the scientific and social sessions.

9. Because the 1980 Semiannual Meeting dates conflict with the Jewish New Year, it was determined that an alternative date and site be selected and authorized the Executive Committee to approve such site selection and date.

10. Authorized providing administrative support for implementation of the Tel-Med System in Maryland.

Executive Committee

The Executive Committee met on June 21, 1979 and took the following actions:

1. Agreed to participate as Amicus in a suit filed by a physician against the Montgomery County Medical Society and physicians in Montgomery County.

2. Declined to join as Amicus in an appeal to the US Supreme Court involving the confidentiality of peer review proceedings. ☐

Discipline Commission Action

Editor's Note: On instruction of the Council of the Medical and Chirurgical Faculty of the State of Maryland, "Findings of Fact, Conclusions of Law and Order" will be published in the JOURNAL as cases become final.

IN THE MATTER OF LEWIS B. NEWBERG, MD, BEFORE THE COMMISSION ON MEDICAL DISCIPLINE OF MARYLAND

FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

Upon certain information coming to its attention, the Maryland Commission on Medical Discipline (the "Commission") determined to charge Lewis B. Newberg, MD, (the "Respondent") with violation of Maryland Code Anno. Article 43, Section 130 (h) (9), (14), (16) and (18).

(9) Willfully making and filing false reports or records, in his practice as a physician;

(14) Willful misrepresentation in treatments;

(16) Gross and willful and continued overcharging for professional services, including filing of false statements for collection of fees for which services are not rendered;

(18) Professional incompetency.

Appropriate notice of the charges and the grounds from which they arose was given to Respondent and a hearing on the charges was scheduled for July 25, 1978, at 9 AM. Prior to the time of the hearing, counsel for the Respondent, Marvin Ellin, Esq. and counsel for the Commission, Stephen J. Sfekas, Assistant Attorney General, engaged in extensive discovery. Depositions were taken of Mr. Robert Heird, Vice President of Blue Shield of Maryland; Paul Mullan, MD, Chairman of the Utilization Review Committee of Blue Shield; Cyrus Blanchard, MD, Chief of Otolaryngology at the University of Maryland Medical School; Stanley Blum, MD, Professor of Otolaryngology at the University of Maryland Medical School; Anthony Hammond, MD, President of the Maryland Society of Otolaryngology; Samuel Lumpkin, MD, Professor of Otolaryngology, Johns Hopkins University Medical School; Douglas Cody, MD, Chief of Otolaryngology, Mayo Clinic and David Austin, MD, Professor of Otolaryngology at the University of Chicago Medical School.

As a result of these depositions and other discussions, consultations, reports and findings, the Commission determined to enter into a Consent Order with the Respondent. The Respondent denies that he has violated any of the provisions of the Maryland Code Anno. Article 43, Section 130 (h) or that he is guilty of any improper, unethical or unprofessional conduct and believes that if tried he would be able to disprove the charges against him; however, he acknowledges the validity of this Order in an effort to avoid the expenses and unpleasantness resulting from these proceedings.

FINDINGS OF FACT

Although the Respondent does not agree that these findings are correct, the Commission finds that:

1. The Respondent's diagnosis of bronchitis and pneumonia in three children under the age of 12 without a physical examination and based solely on X-rays, is not an accepted medical practice.

2. The Respondent's method of treatment of three children under the age of 12 for bronchitis and pneumonia was not consistent with the methods of treatment accepted by medical practitioners competent to engage in this type of practice.

3. The Respondent's use of X-rays is excessive and often medically-inappropriate.

4. The Respondent, on one occasion, performed bilateral mastoid surgery on the same day, although the Commission believes that such bilateral surgery on the same day is contraindicated.

5. The Respondent performed a bilateral Caldwell Luc on Nov. 3, 1976, a left mastoidectomy on Nov. 7, 1976 and a right

mastoidectomy on Dec. 8, 1976, although the Commission believes that such surgery on one patient in so short a time span is contraindicated.

6. In addition to these specifics, other allegations concerning the Respondent's billing practice and indications for surgery were before the Commission.

7. The various depositions taken in this case demonstrate that there is considerable variance in the nomenclature used to describe various types of surgical procedures in the field of Otolaryngology. Thus, while the Otolaryngological Peer Review Committee, consisting of Drs. Blanchard, Blum, Lumpkin and Hammond believes that Respondent has engaged in the practice of "upgrading" of surgical procedures, Drs. Cody and Austin believe, based on the same materials reviewed by the Otolaryngological Peer Review Committee, that Respondent engaged in no improper billing practices.

8. Robert Heird, the Blue Shield representative, testified that Blue Shield had made no finding as to whether the Respondent was engaged in any improper procedure.

9. The Commission believes that in the circumstances of this case that it cannot find, as a matter of fact, that the Respondent engaged in any of the improper activities concerning false records, improper billing, or upgrading of procedures, with which he has been charged.

10. The Commission would also note that while the Otolaryngological Peer Review Committee had doubts as to the propriety of Respondent's practice, the Committee agreed that the Respondent was a technically-proficient surgeon. Drs. Cody and Austin concluded that the Respondent practiced well within the standards of practice of physicians practicing otolaryngology.

CONCLUSIONS OF LAW

The Commission adjudicates the Respondent not to be in violation of Section 130 (h) (9).

The Commission adjudicates the Respondent not to be in violation of Section 130 (h) (14).

The Commission adjudicates the Respondent not to be in violation of Section 130 (h) (16).

The Commission adjudicates the Respondent to be in violation of Section 130 (h) (18), but only to the extent specified in Findings of Fact numbers 1, 2, 3, 4 and 5.

ORDER

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 5th day of September, 1978, by the Commission JSA on Medical Discipline,

ORDERED that the Respondent be, and hereby is REPRI-MANDED and be it further

ORDERED that for a period of two years from the date of this Order the Respondent shall adhere to the following:

1. That Respondent shall cease to treat children under 12 years of age for bronchitis and pneumonia;

2. That Respondent shall permit the Commission or its agents to review the Respondent's patient records, billing records and X-rays, at reasonable times and in a reasonable manner;

3. That such inspections show Respondent to be practicing within acceptable medical and/or surgical standards;

4. That the Respondent shall practice surgery in conformity with the criteria set by the American Board of Otolaryngology; and be it further

ORDERED that should Respondent violate any of the foregoing Conditions, upon notification by and a hearing before the Commission, at which time the Respondent may be represented by counsel, and may present and cross-examine witnesses the Commission may reopen this proceeding and impose such additional sanctions or conditions as may seem appropriate; and be it further

ORDERED that two years from the date of this Order, if the Respondent shall have complied satisfactorily with the conditions of this Order, the said conditions will be lifted and will be of no further force or effect; and be it further

ORDERED that a copy of this Order shall be filed with the Maryland State Board of Medical Examiners.

The Commission would note that the Respondent has indicated his willingness to accept these conditions voluntarily, and the Respondent believes that a review of his records and practice will show him to be practicing in a competent manner.

JOHN E. ADAMS, MD, Chairman

CONSENT

By this Consent, I hereby accept and submit to the foregoing Order and its conditions. I acknowledge the validity of the Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, and to call witnesses in my own behalf, and to all other substantive and procedural protection provided by law. I also recognize that I am waiving my rights to appeal any adverse ruling of the Commission that might have followed any such hearing. By this Consent, I waive all such rights and acknowledge that by my failure to abide by the conditions of this Order I may suffer the revocation or suspension of my license to practice medicine in Maryland.

I emphasize, however, that I deny any wrongdoing, any improper, or unethical, or unprofessional conduct in the past and deny that the findings of fact made hereinabove or conclusions of law are correct. I have agreed to the entry of this Order because I would conform to the conditions even if this Order were not filed, and because I desire the most expeditious resolution of this case.

I sign this Consent without reservation, fully understanding its meaning and after consultation with my counsel.

LEWIS B. NEWBERG, MD

AFFIDAVIT

STATE OF MARYLAND, CITY/COUNTY OF BALTIMORE:

I HEREBY CERTIFY, that on this 14th day of August, 1978, before me, the subscriber, personally appeared LEWIS B. NEWBERG, MD, and he acknowledged the foregoing Consent to be his voluntary act and deed.

AS WITNESS my hand and Notarial Seal.

ELLEN P. GARLICK
Notary Public

My commission expires: July, 1982 ☐
IN THE MATTER OF JOSEPH JACK, JR., MD, BEFORE THE
COMMISSION ON MEDICAL DISCIPLINE

FINDINGS OF FACT, CONCLUSIONS OF
LAW AND ORDER

Upon certain information coming to its attention pursuant to Article 43, Section 130 of the Annotated Code of Maryland, the Peer Review Committee of the Medical and Chirurgical Faculty of the State of Maryland initiated an investigation into the medical practice of the Respondent, Joseph Jack, Jr., MD. Thereafter, the Commission on Medical Discipline determined to charge the Respondent with certain violations of the Code. The violation charged involved the following subsection of Article 43, Section 130 (h) :

(18) Professional incompetence Appropriate notice of the charge and the grounds from which it arose was given to the Respondent and a hearing to consider said charge was scheduled before the Commission on March 15, 1977.

Prior to the date of that hearing, George L. Russell, Jr., Esq., the Respondent's attorney, contacted the Commission and advised that due to certain medical difficulties the Respondent would voluntarily withdraw from the practice of medicine until such time as the Commission heard and evaluated his case. Based on those representations, the hearing was cancelled and the case continued.

Here's how
to set up
your own
retirement plan
and earn
8% interest

Individual Retirement Accounts at The Savings Bank allow you to set aside as much as 15% of your annual income up to \$1500 a year and deduct it from your taxable income.

NO TAXES WILL BE REQUIRED ON THIS AMOUNT UNTIL YOU RETIRE —and by then you'll probably be in a lower tax bracket. See how much \$1500 a year can add up to in a Savings Bank I.R.A. Account,* the pension plan for professionals.

Years	Total I.R.A. Deposits	Total Interest Earned	Savings For Retirement
10	\$15,000	\$ 8,909.02	\$ 23,909.02
20	\$30,000	\$ 47,114.85	\$ 77,114.85
30	\$45,000	\$150,516.22	\$195,516.22

For more information or to open your own Individual Retirement Account, contact any office of The Savings Bank today.

Main Office: Charles and Baltimore Sts. and 20 other convenient locations.

*Based on contributions of \$1500 the first of each year earning 8% interest annually and assuming the rate remains constant.

Following the completion of certain surgical procedures and after a period of recuperation, the Respondent through his attorney asked the Commission to review his case, and determine if he is able to return to practice. The Commission again asked the Peer Review Committee to investigate this matter and make recommendations. By letter dated Jan. 23, 1978 the Commission received the Peer Review Committee's recommendation. On March 21, 1978 the Commission met with Dr. Jack and his attorney, which meeting resulted in the following Consent Order.

FINDINGS OF FACT

The Commission made the following Findings of Fact:

1. That the Respondent suffers from a recurrent meningioma in the sub-frontal region.
2. That neurosurgery was performed for this problem on or about Aug. 11, 1977.
3. That Jorge R. Ordonoz, MD, Respondent's neurosurgeon, stated that as of Nov. 28, 1977, "The neurological examination of Respondent is normal."
4. That John M. Hamilton, MD, is monitoring the Respondent's rehabilitative process and has recommended that the Respondent be permitted to return to the practice of medicine if he receives appropriate supervision.
5. That the Peer Review Committee has made certain recommendations regarding the Respondent's desire to return to practice by letter dated Jan. 23, 1978.

CONCLUSIONS OF LAW

Upon the foregoing Findings of Fact, the Commission concludes as a matter of law that the Respondent, due to certain physical problems, was incapable of the competent practice of medicine.

ORDER

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 21st day of March, 1978, by the unanimous vote of the Commission on Medical Discipline,

ORDERED that the Respondent, an individual licensed to practice medicine in the State of Maryland, is hereby placed on PROBATION and be it further

ORDERED that the Respondent's probationary status shall be based upon the following Conditions of Probation:

- (1) That the Respondent shall arrange for his psychiatrist to submit quarterly reports to the Commission. Respondent's continued probation shall be contingent upon such reports indicating that he is able to practice family medicine in a competent fashion.
- (2) That Respondent shall undertake and successfully complete a program in family medicine at the University of Maryland Medical School under the direction of Edward Kowaleski, MD, the content, length and frequency of attendance of that program subject to approval of the Commission.
- (3) That Respondent's practice of family medicine shall be monitored by the Harford County Medical Society. For one year of practice, such review shall be conducted at least once per month. Thereafter, the frequency of such review shall be as determined by the Harford County Medical Society.
- (4) That Respondent shall arrange for the Harford County Medical Society to submit quarterly reports to the Commission. Respondent's continued probation shall be contingent upon such reports indicating that he is practicing family medicine in a competent fashion.
- (5) That Respondent shall not admit patients to hospitals unless arrangements are made by Respondent for any patient so admitted to also be admitted to the service of another physician. Respondent shall arrange for the co-admitting physician or the chief of staff at any hospitals where patients are admitted, to submit reports quarterly to the Commission. Respondent's continued probation shall be contingent upon such reports indicating that he is practicing family medicine in the hospital setting in a competent fashion.
- (6) That Respondent shall not, during the six months' time period following the date of this Order, prescribe any Class II or Class III drugs. Following this time period, the Harford County Medical Society shall determine whether this restriction

shall be lifted in whole or in part; and be it further,
ORDERED that should Respondent violate any of the foregoing Conditions of Probation, upon notification by and a hearing before the Commission, the Commission may revoke the Respondent's license to practice medicine upon any such showing; and be it further

ORDERED that two years after the date of this Order, the Commission will entertain a petition to terminate Respondent's probationary status. At that time, should the Commission determine that reinstatement would not be appropriate, the Commission may alternatively consider a request to modify one or more of the conditions of Respondent's probation and be it further

ORDERED that a copy of this Order be filed with the Board of Medical Examiners in accordance with Article 43, Section 130(m) of the Annotated Code of Maryland.

JOHN E. ADAMS, MD
Chairman, Commission on Medical Discipline

CONSENT

By this Consent, I hereby accept and submit to the foregoing Order and its conditions. I acknowledge the validity of the Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, and to call witnesses in my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my rights to appeal any adverse ruling of the Commission that might have followed any such hearing. By this Consent, I waive all such rights and acknowledge that by my failure to abide by the conditions of my probation, I may suffer the revocation of my license to practice medicine in Maryland.

I sign this Consent without reservation, fully understanding its meaning and after consultation with my counsel.

JOSEPH JACK, JR., MD
STATE OF MARYLAND, CITY OF Baltimore to wit:

I HEREBY CERTIFY, that on this 12th day of April 1978, before me, the subscriber, personally appeared JOSEPH JACK, JR., MD, and he made oath in due form of law that the foregoing Consent is his voluntary act and deed.

AS WITNESS my hand and Notarial Seal.

Congressman Crane Speaks

Maintaining the independence and freedoms of medicine was strongly-endorsed by Congressman Daniel B. Crane (22nd Dist., IL) at the annual PAC luncheon. In a dynamic manner, he urged physicians to join together and resist governmental controls. This can only be accomplished by a commitment of effort from all, he said.

Physicians are the ones who know medicine best and how best to deliver health care. It is extremely important that the responsibility not be abdicated either to those who are less knowledgeable or those who wish to ensnarl health care deep within a bureaucratic morass, he felt.

Cong. Crane stressed that private medicine is an effective force. It must maintain its cohesion. Through unity its effectiveness will continue. There must be no surrender, he concluded. □

Medical Miscellany

Annual Prize Award in Honor of Dr. Wendell Muncie

The Maryland Association of Private Practicing Psychiatrists and the Maryland Psychiatric Society jointly announce a contest for the awarding of a \$300 prize which will be made to the author who submits the best paper pertaining to a psychiatric subject.

The contest rules are:

Eligible to enter are physicians who reside or practice within the bounds of the Maryland District Branch of the American Psychiatric Association (i.e., all of the State of Maryland except Prince George's and Montgomery Counties) who, as of the deadline for submission of the paper, are no more than 10 years beyond graduation from medical school, have completed at least one year of an approved psychiatric residency and are currently active in the profession of psychiatry.

The subject matter is broadly any topic pertaining to psychiatry or allied fields, and may be of clinical, research, theoretical or other aspects of the subject. The paper must be unpublished, and there are no restrictions as to the length.

The prize will be awarded solely by discretion of the judges. The winner will be asked to read his/her paper personally at the joint meeting of the two societies scheduled for March 6, 1980.

All manuscripts must be received by Dec. 15, 1979. They should be mailed to: Douglas A. Puryear, MD, Committee Chairperson, The Wendell Muncie Annual Prize Award, 1204 Maryland Ave. Baltimore, MD 21201.

Hayfever Sufferers Sought for Allergy Study

Johns Hopkins allergists at Good Samaritan Hospital in Baltimore are seeking adults between the ages of 18-55 who suffer from ragweed hayfever, but have never had allergy shots, to participate in a trial of a new allergy therapy. The doctors hope that the treatment, a series of shots given once a week for five weeks, will suppress undesirable antibodies that cause allergy symptoms. Participants will receive free allergy tests and will be compensated for carfare and loss of time from work.

To volunteer for the study, call the Allergic Disease Center at (301) 323-2200, ext. 458, or write The Allergic Disease Center, Good Samaritan Hospital, 5601 Loch Raven Blvd., Balto., MD 21239. □

"You Are Hereby Summoned to the Health Claims Arbitration Office . . .

By ELZA DAVIS

Ms. Davis, Faculty Communications Director, can be contacted for reprint and other data at 1211 Cathedral St., Balto., MD 21201.

You are an orthopedic surgeon; your name is Elliott Armstrong. On Saturday, Oct. 7, 1978, you are on duty in the Emergency Room of South Hirondeale Hospital in Montgomery County, MD. At around 2 PM, you meet Ms. Adelina Douglas. Ms. Douglas is complaining of pain and swelling of the foot. She was jogging two days ago, she tells you, when she tripped on a curb, fell and hit her left foot against a rock. There was considerable pain at the time of the fall, and Ms. Douglas, who works as a waitress, began soaking the foot in epsom salts and water. By this Saturday morning, the pain has not subsided and swelling has developed.

You send Ms. Douglas for an X-ray. When you see the films, you determine Ms. Douglas has sustained a fracture of the third metatarsal bone of the left foot. Accordingly, you place a cast on the foot, instruct Ms. Douglas in the care of the foot and the cast and ask her to make an appointment to see you in your office at the Forrest Office Building on Nov. 4th. You release Ms. Douglas at approximately 5:15 PM.

Adelina Douglas keeps her appointment on Nov. 4th. She tells you she has been in some pain throughout most of the month since the foot was set. You remove the cast and again X-ray the foot. A lump has formed on the anterior aspect of the left foot. Upon examination of the films and a visual examination of the foot, you inform Ms. Douglas that her foot is healing properly, and in time will be completely normal. You provide Ms. Douglas with an arch support to wear while working and ask her to return on Nov. 13th. She returns on Nov. 13th still complaining of pain. She has returned to work, but finds she is unable to move as quickly as necessary to keep up with the customers. You visually examine the foot and notice the lump has been reduced somewhat. You tell Adelina Douglas the lump and the pain will gradually reduce as the bone

continues to heal and that she will soon be back to normal. You then release Ms. Douglas from your care.

The next time you see Adelina Douglas is Monday, Aug. 6, 1979 at 9 AM. You and your attorney are seated around a table in the office of John Michael Gallagher, Chairman of an arbitration panel of the Health Claims Arbitration Office of the State of Maryland. The purpose of this meeting is to determine if you have been negligent in the treatment of Ms. Douglas, who is suing you for an amount in excess of \$5,000.

Your first indication of trouble was in the form of a summons, issued by the Health Claims Arbitration Office, and served upon you at your office by Deputy Sheriff Barney Victor on Feb. 20, 1979. Francis J. Prince, your attorney, responds by March 29th stating that neither you or South Hirondeale Hospital, also named in the suit, have been negligent in providing or rendering care and treatment to the claimant.

During the interval between the response of the attorney and the Aug. 6th panel hearing, the Health Claims Arbitration Office has been extremely busy. It is their responsibility to arrange for an arbitration panel to be convened in each instance of a claim against a health care provider in excess of \$5,000. The panel is composed of three persons—an attorney, a health care provider and a layman. Included in the health care provider group are: physicians, osteopaths, optometrists, chiropractors, nurses, dentists, podiatrists, physical therapists or hospitals and related institutions. In all cases, the attorney acts as panel Chairman.

In 1976, the General Assembly of Maryland enacted the Arbitration Statute. For the next two years, the law successfully withstood a series of court challenges. The first case was heard in the fall of 1978. This is how the procedure works:

The arbitration office mails identical lists of potential arbitrators—five attorneys, five health care providers and five public members—to attorneys for both plaintiff and defendant. Each is permitted to strike two names.

from each category. Of the remaining acceptable members, a panel is formed and the attorney, acting as chairman, contacts the attorneys involved and sets a pre-hearing conference. Requests for documents are submitted to the defendant's attorney as well as a list of interrogatories or questions the defendant must answer under oath. A further summons is issued, stating the date by which the aforementioned documents must be produced. After the pre-hearing conference has been concluded, the formal hearing on the action is convened.

The job of the arbitration panel is two-fold. First, it must determine if there is negligence. If the panel finds negligence, it then determines the amount of the award. The decision of the panel is admissible into court and presumed correct; that is, the disappointed party in the suit may ask for a court trial. Panel determination of negligence or lack thereof is presumed correct as is the amount of the award. The panel also must rule whether the fees for legal services are reasonable. The panel determines the assessment of costs for the arbitration proceedings, including the fees for services of the arbitrators. Presently, the attorney/chairman of the panel is paid \$60 per day and expenses. The other two members of the panel are paid \$40 per day and expenses.

These and other mysteries of Maryland's arbitration law were explained recently to a large audience of attorneys and physicians at two seminars presented by the Maryland Institute for Continuing Professional Education of Lawyers. Part of the presentation included a video tape of the case outlined above. Faculty members, plaintiff's and defendant's attorneys and members of the arbitration office played the roles of those involved in the case of Adelina Douglas vs. Elliott Armstrong, MD.

Since the panel is not bound by the technical rules of evidence, the proceeding is rather informal. The documents of evidence are passed around the table for examination by the arbitrators and attorneys. Questions follow some of the standard procedures you might hear in court; however, there are fewer objections, and the discussion is permitted to range far more than it is in court. To date, the Arbitration Office has received 185 cases. Six of these have been heard; 140 cases are in various stages of preparation; 12 have been scheduled for hearing. The case load is growing by approximately 20 cases per month. Nearly 3,000 volunteers have signed up to serve as panelists. Of this number, the largest group are the public members, with attorneys next, followed by health care providers.

Maryland's arbitration statute was developed in conjunction with the Faculty. The purpose of the law is to provide a mechanism for determining the merits of professional liability suits in a manner that is less costly and more expeditious for both plaintiff and defendant than the usual trial court procedure. Whether it will work as it was designed has yet to be shown. Many of the cases that will be decided by the panels will have to undergo court challenge so the parameters of the law can be defined. For the law to really work

This Year 300 Physicians Will Start A Practice They Thought Couldn't Exist.

will require the cooperation of all parties involved. An important aspect of the mechanism is the physician as a member of the arbitration panel. Currently, there are not nearly enough physicians serving, and most are asked to participate in panels dealing with matters outside their specialty areas. Since physician experts usually appear at the hearing procedure, it is not vital that the physician panelist practice in the area of medicine being considered. It is crucial, however, to have sufficient physicians from which to draw in any given area. Currently some counties are extremely deficient in the pool of physicians available for selection.

Physicians are urged to volunteer for a panel assignment, by contacting the Health Claims Arbitration Office, 201 W. Preston St., Baltimore, MD 21201, (301) 383-3910. Ms. Lynn Deutschman is the Assistant Director of the office and will be pleased to answer questions regarding the arbitration mechanism. In addition, information is available through the Faculty office.

PRN

By KENNARD YAFFE, MD

Dr. Yaffe, formerly Chairman of the Med-Chi Committee on Drugs, can be contacted for reprint and other data at 1211 Cathedral St., Balto., MD 21201, at the Faculty Building.

There exists much uncertainty about the proper use of PRN. Many questions have been received from pharmacists about "Refill, PRN." Frequently, doctors write for drugs used over an unlimited time, such as thyroid, digitalis, etc. in this fashion.

The question is raised as to the proper role of the pharmacist in filling such a prescription—should it be for one, two, five years?

In my opinion, the responsibility lies with the doctor to indicate some definite period of time. I think one year would be reasonable—it should create no significant hardship to do so, and would give some evidence to the pharmacist that the physician is retaining control of the patient's medication. I might also say that pharmacists are often reluctant to call the doctor by phone for this purpose because of the doctor's surly responses.

PRN is also too often used on prescriptions in directions for taking drugs. There are many drugs, such as classified and psychotropics, whose directions for use should be spelled-out precisely. For the average, mentally-alert patient, it is wiser and safe to do so. For the elderly and less alert, it is imperative to be absolutely explicit. Under some circumstances, failure to be explicit could even be considered negligence, a nasty word to physicians. □

Conduct with Pronestyl® Tablets

Procainamide Hydrochloride Tablets

The only procainamide in
veneer-coated, easy-to-swallow tablets

250 mg

375 mg

500 mg

- available in 3 tablet strengths for easier dosage adjustment—up or down—in all patients
- produced under exacting quality control standards by Squibb—numerous critical control tests from starting material to finished product
- offered only under the Squibb label—your assurance of reliable, quality therapy for life-threatening arrhythmias.

See following page for brief summary

PRONESTYL® TABLETS

Procainamide Hydrochloride Tablets

The prolonged administration of procainamide often leads to the development of a positive anti-nuclear antibody (ANA) test with or without symptoms of lupus erythematosus-like syndrome. If a positive ANA titer develops, the benefit/risk ratio related to continued procainamide therapy should be assessed. This may necessitate considerations of alternative anti-arrhythmic therapy.

DESCRIPTION: Pronestyl (Procainamide Hydrochloride) is the amide analogue of procaine hydrochloride and is available for oral administration as veneer-coated tablets providing 250 mg, 375 mg, and 500 mg procainamide hydrochloride.

CONTRAINDICATIONS: In patients with myasthenia gravis and where a hypersensitivity to procainamide exists; bear in mind cross sensitivity to procaine and related drugs. Should not be given to patients with complete atrioventricular heart block. Contraindicated in cases of second degree and third degree A-V block unless an electrical pacemaker is operative.

PRECAUTIONS: Evidence of untoward myocardial responses should be carefully watched for in all patients. In the presence of myocardial damage with atrial fibrillation or flutter, the ventricular rate may increase suddenly as the atrial rate is slowed; adequate digitalization reduces but does not abolish this danger. Ventricular tachysystole is particularly hazardous if myocardial damage exists.

The dislodgment of mural thrombi producing an embolic episode may occur in correcting atrial fibrillation due to the forceful contractions of the atrium.

Extreme caution is required in attempting to adjust the heart rate when ventricular tachycardia has occurred during an occlusive coronary episode or where the use of procainamide may result in additional depression of conduction and ventricular asystole or fibrillation as in second degree and third degree A-V block, bundle branch block, or severe digitalis intoxication.

Bear in mind when treating ventricular arrhythmias in patients with severe organic heart disease and ventricular tachycardia that complete heart block, which may be difficult to diagnose, may be present. Since asystole may result if the ventricular rate is significantly slowed without attainment of regular atrioventricular conduction, procainamide should be stopped and the patient re-evaluated.

In the presence of both liver and kidney damage, normal dosage may produce symptoms of overdosage—principally ventricular tachycardia and severe hypotension.

A syndrome resembling lupus erythematosus has been reported with oral maintenance procainamide therapy. Common symptoms are polyarthralgia, arthritis and pleuritic pain. Fever, myalgia, skin lesions, pleural effusion and pericarditis may also occur. Rare cases of thrombocytopenia or Coombs-positive hemolytic anemia, possibly related to this syndrome, have been

reported. Measure anti-nuclear antibody titers at regular intervals in patients on procainamide for extended periods of time or in whom symptoms suggestive of lupus-like reaction appear; in event of rising titer (anti-nuclear antibody) or clinical symptoms of LE, assess the benefit/risk ratio related to continued procainamide therapy (see boxed Warning). Steroid therapy may be effective if discontinuation of procainamide does not cause remission of symptoms. If the syndrome develops in a patient with recurrent life-threatening arrhythmias not otherwise controllable, steroid-suppressive therapy may be used concomitantly with procainamide.

ADVERSE REACTIONS: Hypotension is rare with oral administration. Serious disturbances of cardiac rhythm such as ventricular asystole or fibrillation are more common with I.V. administration.

Large oral doses may sometimes produce anorexia, nausea, urticaria, and/or pruritus.

A syndrome resembling lupus erythematosus has been reported in patients on oral maintenance therapy (see Precautions). Reactions consisting of fever and chills have been reported, including a case with nausea, vomiting, abdominal pain, acute hepatomegaly, and a rise in serum glutamic oxaloacetic transaminase following single doses of the drug. Agranulocytosis has been occasionally reported following repeated use of the drug, and deaths have occurred. Therefore, routine blood counts are advisable during maintenance procainamide therapy; and the patient should be instructed to report any soreness of the mouth, throat or gums, unexplained fever or any symptoms of upper respiratory tract infection. If any of these symptoms should occur and leukocyte counts indicate cellular depression, procainamide therapy should be discontinued and appropriate treatment should be instituted immediately. Bitter taste, diarrhea, weakness, mental depression, giddiness, psychosis with hallucinations, and hypersensitivity reactions such as angioneurotic edema and maculopapular rash have been reported.

For full prescribing information, consult package insert.

HOW SUPPLIED: Pronestyl Tablets (Procainamide Hydrochloride Tablets) providing 250 mg, 375 mg, and 500 mg procainamide hydrochloride are available in bottles of 100 and Unimatic® single-dose packaging in cartons of 100. The 250 mg and 500 mg tablets are also available in bottles of 1000.

'The Priceless Ingredient of every product is the honor and integrity of its maker.'™

Exclusive Profile/Interview of New Med-Chi President William A. Pillsbury, MD

By BLAINE TAYLOR

Contact Mr. Taylor, Journal Managing Editor, for reprint and other data c/o the Journal, 1211 Cathedral St., Baltimore, MD 21201

Introduction

"I used to be a 'Young Turk' and now I'm an old fossil," joked William Andrew Pillsbury, MD, Med-Chi's new President, during an unprecedented Presidential meeting with the Faculty's entire paid staff at its headquarters building at 1211 Cathedral St. in Baltimore on May 24, 1979. The extraordinary, face-to-face session, requested by Dr. Pillsbury, was intended to personally acquaint the 56-

year-old native Baltimorean with those on whom the Faculty depends for its daily functioning. (He found them, he says, "Innovative and dedicated.") Earlier—on Apr. 20th—the tall (6' 2"), affable and stocky General Practitioner had been interviewed by the **Journal** in his office at the Baltimore Gas and Electric Company's building at the corner of Lexington and Liberty Sts. in the city's core downtown, for which firm he has been Medical Director since 1974.

Born Aug. 29, 1922, Dr. Pillsbury graduated from Baltimore City College in 1940 and attended the University of Oregon before serving in World War II

as an infantryman in the Colmar Pocket battle in France and on the Siegfried Line in Germany as a member of the US Army's 63rd Infantry Division. By the time he was discharged as a Master Sergeant in 1946, Dr. Pillsbury had won the Bronze Star. He graduated from Loyola College two years afterward. The occupational physician and family practitioner graduated in 1952 from the University of Maryland School of Medicine. Following an Internship and General Practice Residency at Baltimore's Bon Secours Hospital during 1952-54, Dr. Pillsbury conducted a General Practice for two decades in Timonium, MD before assuming his current post as a full-time, salaried physician. During 1954-71, he was part-time Plant Physician for the Bendix Corporation's Joppa Rd. facility in Towson, MD; was President of the Baltimore County Medical Association, was Med-Chi Secretary for 12 years (and Council Vice Chairman and Chairman during 1975-78), as well as being a past member and Vice Chairman of the Baltimore County Board of Social Services.

A former Assistant Medical Examiner for Baltimore County, Dr. Pillsbury also served as physician for St. Paul's School during 1958-73, and for the period 1968-73, was staff physician for the Baltimore County Employees' Health Services, as well as being on the County's Youth Commission.

Since 1974, Dr. Pillsbury has been a member of the Medical Advisory Board of Philadelphia's Radiation Management Corp., Medical Consultant to the Edison Electric Institute's Industrial Health Committee, is President of the Maryland Occupational Medical Association and is a member of the American OMA and AMA, too.

At BG and E, Dr. Pillsbury supervises a staff of 15, including two full-time and one part-time physicians, four physicians' assistants and two nurses, plus clerical staff. The office runs satellite dispensaries at Timonium, at the Calvert Cliffs nuclear power plant and at its Madison St. complex in downtown Baltimore. Overall, the staff conducts pre-employment physical examinations, treats occupational and minor, on-the-job illnesses.

The name Pillsbury evolves from the older, English form of "Pilsborough," and the current MD, who hails from a family of physicians, proudly notes that his clan landed in the Massachusetts Bay Colony in the 1700s.

Dr. Pillsbury's own family consists of wife Vertalee McCusker (whom he married in 1946), son William T., 21, a student at Brandywine College; plus daughters Mrs. Vertalee P. Kozak, 32, a

John Deere Co. employee; Mrs. Laurel P. McCusker, 23 and Teresa R., 20, a student at Radford College. The senior Pillsburys also have a five-year-old grandson, Teddy.

We began our session by discussing Dr. Pillsbury's hopes for his Presidency.

Goals

As President, what do you hope to accomplish during your year in office and, realistically—with all the constraints you're under and with the amount of people with whom you have to deal—what do you think you CAN do?

The first thing is to try to continue what is being done and aggressively pursue it. Also, I'd like to try to get more of our full-time, salaried Medical Doctors to join Med-Chi as members. The fact that I'm in—as a full-time, salaried physician—shows that we, as a class, have gained acceptance, and I'm hoping that others will see the benefits of joining too.

Can ANY President come into office at Med-Chi and be an earth-shaker?

You can't be an earth-shaker because the President, as I see it, is committed to carry out the policies of the organization. Despite popular opinion, the President **isn't** a dictator, but can only exert leadership.

IS there a dictator at Med-Chi?

No, and I can cite you an example of what I mean. When I was President of the Baltimore County Medical Association, it was accused of being run by a clique. Our two biggest accusers were elected President in successive years—and we haven't heard a complaint out of them since! The reason is obvious: the people who're active in the Society and who devote the time to it are the ones who "run" it—if you want to use that word.

DR. and MRS. PILLSBURY
(Photo courtesy of Dr. Pillsbury.)

"I'm a firm believer in 'working through the system,' to use a phrase we used to hear a lot. If you want to change something, get in it.

At Med-Chi, everything is subject to the policy set down by the Council and the House of Delegates. Every Med-Chi President I've known has tried to get the younger physicians involved. The response has **not** been overwhelming whenever we've sent out cards asking for committee participation, either, from our members, particularly from those physicians with under five years of practice. Whenever we've had the name of someone interested in a particular Med-Chi committee, we've tried to appoint that person to that committee.

Several years ago, the Council Chairman was really the leader, but that's no longer true today. You'll find that the members of the House of Delegates—which is the ultimate policy-making body and source of authority—are people who're their own thinkers. It's more democratic now than its ever been in my view. The Council **can** only act in the interval between House meetings, but it can't do **anything** against policy set by the House. I like to think that it's a fairly smooth and fast-working process of getting things done. Most of the House members aren't previously-instructed, and so can think and react for themselves as things come up on the floor of the House during discussions.

Committee Importance

I think too much importance is placed on the Council and Executive Committee. Basically, the real gut-work of the Faculty is done by the Committees. They're our unsung heroes. Many of them come from great distances and work like hell! They serve and produce excellent reports. You can't rank the Committees in order of their importance, because they all have different functions—Peer Review, for example, and Preventive Health and on and on.

What do you think have been some of the more important items that've come out of the Med-Chi system that've later been enacted into law or otherwise affected the public's health?

One of the most important advances in recent years has been the work of Jack Sargeant and Dr. John Dennis in setting up the Commission on Medical Discipline, Drs. Joseph Berman and Katie Borkovich with their Peer Review Committee and, just last year, Dr. Jerome Collier with the Physician Rehabilitation Committee. Then, there are the real Faculty workhorses: Drs. Russell Fisher and Charles O'Donnell, the late Mac Boyer, the late Albert Goldstein (the current Treasurer's father), Arthur Keefe and Karl Mech, Sr., to mention a few.

The AMA Presidency

Is it the goal of every Med-Chi President to perhaps become AMA President someday?

Looking back over the Med-Chi Presidents I've known, I'd say about 50% of them were interested in being active on the national level, but not necessarily the AMA Presidency. I think we're blessed with our Med-Chi Delegates to the AMA (ed. Note: see **Journal**, April, 1979). Our representatives—Russell Fisher, Charles and Steve Padussis—are all excellent and work hard.

Occupational Physicians

Are there many occupational physicians such as yourself in Maryland?

No, unfortunately, because not many industries have full-time physicians. Some of those who do are the Chesapeake and Potomac Telephone Co. (ed. note: see **Journal**, August, 1977, for a profile of John R. Davis, MD, of the C and P), Western Electric; also Bethlehem Steel Corp. I'm President also of the Maryland Occupational Medical Society, which is a statewide group having about 60-70 members. Many of them are part-time or run clinics to handle occupational cases. Nationally, there're about 4,000 occupational physicians.

So, in Maryland, there're about 65 doctors out of a total physician population of about 6,000. That's a rather miniscule percentage, but I imagine it's growing.

Yes, because of the carcinogen regulations and various programs of government-mandated medical surveillance concerning asbestos, for example, and radiation, as seen recently in the Three-Mile Island incident involving the Federal Nuclear Regulatory Commission.

Considering the Three-Mile Island affair, if anything similar happened at the Baltimore Gas and Electric Co.'s Calvert Cliffs facility, would you be the one to go down there to take charge medically?

Yes. I would be down there—responsible for the biological effects—the minor things—not the health physics side of it, though.

Is there a tendency throughout business and industry—which is now getting bigger and bigger—to employ their own, in-house physicians to treat their employees?

Yes. The basic reason—despite popular misconception—is **not** to provide a source of information to management. Confidentiality of patient records is the **rule**, **not** the exception. We're very serious about that, but a lot of people think that the company doctor is a stoolpigeon.

The shortage of primary care physicians in certain areas has forced some companies to offer in-house treatment of much illness.

The old image of the company physician was of someone who could give out aspirin and who was strictly on management's side. In recent years, occupational medicine has become a specialty. It requires not just a knowledge of medicine, but entails also a grasp of toxicology and epidemiology. In the chemical industry, for instance, they're finding more and more toxic substances, such as

kepone. Med-Chi has an Occupational Health Committee that deals with these kinds of problems, too.

Image Concerns

As a physician what—in your mind—is the biggest threat to medicine today? What are you, personally, most concerned about?

Public image. Certain people in the country are determined to make doctors the scapegoats for inflation. I'm talking about liberal politicians like Ted Kennedy. To give you an example, there was a quote from someone that they weren't going to give doctors a special allocation of gasoline, if it came to rationing, because they didn't want them riding around in their yachts and Cadillacs. I think there's a basic resentment of physicians among some segments of the community, yet everyone seems to like his or her own doctor. We should take steps to improve our own image. It can be done if the art of medicine were taught as well as its science. I'm a firm believer in communication, and I think that if doctors would share their decisions with their patients—the why of things—that their image would improve somewhat thereby. I'm not talking about why you're removing a breast, but why you're prescribing a certain medicine and what the side-effects of it will be.

Do you think that this'll make the doctor more human to the patient?

Of course! I think doctors today are much more science-oriented than was my generation. After you've taken out 2,000 appendices, you don't get too excited about another one—but it's a big problem to the person concerned!

Hobbies

What are your hobbies?

My wife will tell you that I'm a very passive, intellectual individual. My hobby is relaxing! I'm an opera buff, and I go whenever I can—rather infrequently—to the Metropolitan Opera House in New York. I'm into a hobby called latch-hooking, which is sort of like the old rug-weaving, but using wool and acrylics instead to make pillow covers and wall-hangings. It's very archaic, but relaxing, because I find I can do it and listen to music at the same time.

I like to read history, especially that of the American Civil War, which brings me to the subject of the Med-Chi Library and its Librarian, Joseph Jensen. The Library is one of the things that thrills me about Med-Chi, because we probably have one of the richest library traditions of any medical society in the country. I think that in the person of Mr. Jensen, we have an excellent Librarian—a person not just interested in books—but also in the people who use them. I'm just delighted to see the Library's business picking up.

Future

What about your future? Do you plan

A PILLSBURY FAMILY BIRTHDAY CELEBRATION, JANUARY, 1979: (from left to right) daughter Vertalee, Dr. Pillsbury, Mrs. Pillsbury, grandson Teddy, son William (in glasses, standing) and daughters Teresa and Laurel.

to stay here as a physician until your retirement, whenever that is?

Yes. At present, I have every intention of knocking off at age 65. I'm a firm believer in youth. We need younger blood and innovation, which is one of the reasons why I'd love to see younger physicians getting active in the Faculty. I'm looking forward to traveling in Europe during my retirement. Don't get me started on Europe and the Renaissance!

All right, I won't! Thank you, Dr. Pillsbury.

(Photo by Tadder, Balto.)

When the indications surface...

Net wt 1 oz

Net wt 1/2 oz

Net wt 1/32 oz (approx)

NEOSPORIN[®] Ointment

(Polymyxin B-Bacitracin-Neomycin)

Burroughs Wellcome Co.
Research Triangle Park
North Carolina 27709

Each gram contains: Aerosporin[®] (Polymyxin B Sulfate) 5,000 units, bacitracin zinc 400 units, neomycin sulfate 5 mg (equivalent to 3.5 mg neomycin base), special white petrolatum qs; in tubes of 1 oz and 1/2 oz and 1/32 oz (approx.) foil packets.

INDICATIONS: Therapeutically, (as an adjunct to systemic therapy when indicated), for topical infections, primary or secondary, due to susceptible organisms, as in: infected burns, skin grafts, surgical incisions, otitis externa; primary pyodermas (impetigo, ecthyma, sycosis vulgaris, paronychia); secondarily infected dermatoses (eczema, herpes, and seborrheic dermatitis); traumatic lesions, inflamed or suppurating as a result of bacterial infection. Prophylactically, the

ointment may be used to prevent bacterial contamination in burns, skin grafts, incisions, and other clean lesions. For abrasions, minor cuts and wounds accidentally incurred, its use may prevent the development of infection and permit wound healing.

CONTRAINDICATIONS: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components. Do not use in the eyes or in the external ear canal if the eardrum is perforated.

WARNING: Because of the potential hazard of nephrotoxicity and ototoxicity due to neomycin, care should be exercised when using this product in treating extensive burns, trophic ulceration and other extensive conditions where absorption of neomycin is possible. In burns where more than 20 percent of the body surface is affected, especially if the patient has impaired renal function or is receiving other aminoglycoside antibiotics concurrently, not more than one application a day is recommended.

When using neomycin-containing products to control

secondary infection in the chronic dermatoses, it should be borne in mind that the skin is more liable to become sensitized to many substances, including neomycin. The manifestation of sensitization to neomycin is usually a low grade reddening with swelling, dry scaling and itching; it may be manifest simply as failure to heal. During long-term use of neomycin-containing products, periodic examination for such signs is advisable and the patient should be told to discontinue the product if they are observed. These symptoms regress quickly on withdrawing the medication. Neomycin-containing applications should be avoided for that patient thereafter.

PRECAUTIONS: As with other antibacterial preparations, prolonged use may result in overgrowth of nonsusceptible organisms, including fungi. Appropriate measures should be taken if this occurs.

ADVERSE REACTIONS: Neomycin is a not uncommon cutaneous sensitizer. Articles in the current literature indicate an increase in the prevalence of persons allergic to neomycin. Ototoxicity and nephrotoxicity have been reported (see Warning section).

BODY CT / NEURO CT

A TWO-PART SYMPOSIUM ON COMPUTED TOMOGRAPHY
OCTOBER 10-12, 1979

PRESENTED BY THE DEPARTMENT
OF DIAGNOSTIC RADIOLOGY
AND THE PROGRAM OF
CONTINUING EDUCATION

UNIVERSITY OF MARYLAND
SCHOOL OF MEDICINE

BODY CT

PROGRAM

NEURO CT

October 10, morning

Welcome—John M. Dennis, M.D., and Joseph Whitley, M.D.

Moderator: Nancy Whitley, M.D.

CT of the Larynx — Stephen Cisternino, M.D.

CT of the Pulmonary Nodule — Stanley Siegelman, M.D.

CT of the Mediastinum and Pleura — Charles Putman, M.D.

CT Scanning of the Pancreas — Ralph Alfidi, M.D.

CT Scanning of Kidneys and Adrenals — Stanley Siegelman, M.D.

Comparative Aspects of Ultrasound and CT of the Retroperitoneum — Conrade C. Jaffe, M.D.

October 10, afternoon

Moderator: Morgan Dunne, M.D.

CT of the Pelvis — Nancy Whitley, M.D.

CT in Musculoskeletal Neoplasms — Peter Mueller, M.D.

Sequential CT Scanning after IV Contrast — Ralph Alfidi, M.D.

Clinical Application of Multiplanar Reconstruction in CT of the Abdomen — Conrade C. Jaffe, M.D.

Interventional CT — Peter Mueller, M.D.

October 11, morning

Moderator: Stephen Cisternino, M.D.

Global Abdominal Anatomy by Ultrasound and Computed Tomography — Morgan Dunne, M.D.

Computed Tomography of Trauma — Edward Druy, M.D.

New Developments in CT Technology — John Perry

The Use of CT in Radiation Therapy Planning — Ralph Scott, M.D.

October 11, midday: Workshop sessions at the University of Maryland Hospital and Johns Hopkins Hospital will demonstrate CT diagnostic activities in clinical settings.

Location: INTERNATIONAL HOTEL, Baltimore-Washington International Airport.

Pre-registration: Early pre-registration by mail is encouraged since conference facilities necessitate limited enrollment. Registration, with a \$15 late fee, will be possible on a space available basis at the International Hotel, 7:30 am, October 10 and 10:00 am, October 11.

Fee:

	Physicians	Residents, Interns and Other Professionals
Full 3-day course:	\$200	\$135
Body CT session only:	\$125	\$ 80
Neuro CT session only:	\$125	\$ 80

The total registration fee, payable in advance, includes the cost of instructional materials, coffee breaks, lunches, and reception.

Credits: 20 credit hours in Category I of the Physician's Recognition Award, American Medical Association, for the entire course.

Supported by an educational grant from Pfizer Medical Systems, Inc.

October 11, afternoon

Moderator: Krishna C.V.G. Rao, M.D.

Functional CT Anatomy — Mokhtar H. Gado, M.D.

Sensitivity and Specificity of CT Scanning in Intracranial Neoplasm — Sadek K. Hilal, M.D., Ph.D.

CT in Sellar and Parasellar Lesions — Fred J. Hodges, III, M.D.

Normal and Abnormal CT Anatomy of Intracellar Structures — Sadek K. Hilal, M.D., Ph.D.

October 12, morning

Moderator: Richard F. Mayer, M.D.

CT in Stroke — Irvin Kricheff, M.D.

Intracranial Anomalies — Derek C. Harwood-Nash, M.D.

CT in Certain Pediatric Conditions — Krishna C.V.G. Rao, M.D.

Moderator: Harvey H. Levine, M.D.

CT in Head Trauma — Pulla R.S. Kishore, M.D.

CT in Degenerative Brain Disease — Giovanni DiChiro, M.D.

CT in Infection — S.H. Lee, M.D.

October 12, afternoon

Moderator: Thomas B. Ducker, M.D.

Computed Tomography/Metrizamide in Evaluation of Pediatric Spine — Derek C. Harwood-Nash, M.D.

CT/Metrizamide in the Adult Spine — Mokhtar Gado, M.D.

Use of Metrizamide and Alternative Methods of Evaluating Posterior Fossa Lesions — Irvin Kricheff, M.D.

Recent Trends in Neuro-imaging Modalities — Giovanni DiChiro, M.D.

Moderator: Giovanni DiChiro, M.D.

How The Medical and Chirurgical Faculty Operates

By ELZA DAVIS

Ms. Davis is Med-Chi's energetic Communications Director.

Med-Chi, the Medical and Chirurgical Faculty of the State of Maryland, has virtually grown up with America, since its incorporation in 1799. As Maryland's society of medical doctors, Med-Chi ranks as one of the oldest—and one of the most progressive—organized medical associations in the United States.

Since Med-Chi's incorporation by a Special Act of the Maryland Legislature, the Faculty has worked to continue its founding tradition: "... To secure ... just laws relating to the practice of medicine and public health."

The Faculty includes in its membership more than 5,000 physicians in Maryland. Many members do important work on the Faculty's network of 45 active committees engaged in a wide range of interests and activities.

Med-Chi is composed of 24 component medical societies, one for each Maryland County and one for Baltimore City. The Faculty, in turn, a component of the American Medical Association, is a non-profit organization and is tax-exempt.

Officers of the Faculty, elected by the House of Delegates at each Annual Meeting, consist of the President, President-Elect, First, Second and Third Vice Presidents, Secretary and Treasurer.

Voting members of the House of Delegates consist of the members of the Council, a member of the Board of Medical Examiners, one delegate from each component society, plus one additional delegate for each 50 active and 40-year members or major fraction of each component. The House of Delegates meets twice each year, at the Annual and the Semiannual meetings.

Between meetings of the House of Delegates, author-

ity to conduct the business of the Faculty is vested in the Council. Councilors are elected by the component societies in the ratio of one councilor for each 200 active and 40-year members or portion thereof. Council voting is proportional, based on the total membership of each component society. The Council elects its own Chairman and Vice Chairman. These two, plus the Immediate Past President, President, President-Elect, Secretary and Treasurer of the Faculty, constitute the Executive Committee. This committee acts in an advisory capacity to the officers and staff in questions of immediate importance between meetings of the Council, and is directly responsible to the Council.

Daily operations of the Faculty are vested in the Executive Director and staff, who are responsible to the Council, officers and committee chairmen. Chairmen of Faculty committees are appointed annually by the President. A staff member is assigned to each committee, and works under the supervision of the committee.

Self-regulation is a term often misunderstood today, but it is critically-important to today's physician. Med-Chi has developed an efficient program of self-regulation. Through its Peer Review, Physician/Patient Relations and Drug Committees, Med-Chi maintains one of the most effective systems of monitoring physicians' practices in this country.

The Faculty requires no political or institutional intervention to ensure members' competence. Instead, member physicians act as checks and balances, working closely with committees on the component society level and with the State Commission on Medical Discipline.

BEFORE HAIR FOREVER

AFTER HAIR FOREVER

Speech of Francis C. Mayle, Jr., MD to the Med-Chi House of Delegates, May 2, 1979, Hunt Valley Inn

Dr. Cloud, Delegates, members of the Faculty, their families and guests:

In looking back over the original Articles of Incorporation of the Faculty, one of the duties of President is to give a yearly summation of the term of office and, to paraphrase a topical term: "This has been a year of good news and a year of bad news."

It has actually been the year of awards and the year of conflict. This year we were very fortunate to have two of our members honored for their public speaking achievements at the AMA National Leadership Conference. Dr. Raymond J. Donovan, Chairman of our Public Relations Committee, received First Prize for a television talk show. Dr. J. Roy Guyther, a member of our Council, won Second Prize for speaking before a professional audience. Both of these awards consisted of a cash prize presented to the Faculty and a plaque commemorating this event given to the award winners.

The Faculty itself won an award for its renovation of one of the buildings acquired last year, located next to the Faculty headquarters. This award was given by the Baltimore Heritage for preservation and restoration of the historical property located on Maryland Avenue, but, I think even more importantly, each member of the Faculty should receive an award for responding to the needs of the community in providing higher quality medical care and service to the public, especially Committee Chairmen and members should be congratulated for their hard work in carrying out the various responsibilities entrusted to them in the Faculty Bylaws. Though many of these activities seem mundane and routine, many are very important, requiring much time and effort—and contribute in great part to the image of the profession. I have chosen to tell you about a few of the Committees to illustrate my point.

Our newly-formed Physician Rehabilitation Committee now has over 60 cases under its jurisdiction. This group should

be commended for offering a helping hand to their colleagues and families.

Our Peer Review group has come a long way since its inception under Dr. Russell Fisher when he was Faculty President. It is now referring many cases to the local level and has begun to turn its attention to areas involving the quality of inpatient care at institutions throughout the state. Also, in connection with this, our Drug Committee finds a never-ending problem with physicians who are not firm enough with their patients in fulfilling requests for Schedule II substances. Our cooperation with drug authorities and law enforcement officials continues to be at a high level.

Government agencies, however, have proliferated, and control of physicians and their practices continues. We are fortunate in adding to our staff an expert in health planning and, thus, are able to monitor more effectively the activities of both state and local planning agencies. In this way, we are better able to *ACT* rather than *REACT*. I am glad to say we have been able to provide more input and influence over some of the decisions in this area.

The Health Services Cost Review Commission is still with us. We are attempting to work with this group in areas of mutual concern, and are reviewing with them the necessity for some ancillary services. Our Ad Hoc Committee headed by Dr. Harry F. Klinefelter anticipated public announcements some months ago by national Blue Cross and Blue Shield about inappropriate testing of in-hospital patients. Our work in this area continues. We must, and will, continue to monitor these areas as this presents an avenue for reduction of health costs—one which could effectively produce cost-saving for our patients.

Our Committee on Continuing Medical Education has had some difficulties this year where an attempt has been made on a national level to interject bureaucracy and removal from local jurisdiction the authority for accrediting CME

programs. Hopefully, this has been resolved and the Council has given its full backing to this Committee in attempting to correct the matter.

Our Liaison Committee with the State Department of Health and Mental Hygiene, has worked consistently in attempting to improve reimbursement and procedural matters in the Medicaid Program; unfortunately, this group has been unsuccessful in resolving all the issues, but remains undaunted in its continuing efforts in this direction. Let us hope some progress can be made this year.

Our Legislative Committee reviewed over 400 items of legislation during the 90-day legislative session. We were partially successful in moderating some of the legislative proposals; unsuccessful in defeating some legislation and successful in others. Overall we can consider this to be as good a legislative session as we have had, although not perfect. Dedication on the part of individual physicians and staff is responsible for our record.

Our Policy and Planning Committee has become more active than in past years and is currently studying many areas where improvement in our member benefits hopefully can take place, and how to adjust our dues picture so we are not faced with periodic operating deficits because of inflation and the cost of doing Faculty business. This House of Delegates will have the opportunity of reviewing several proposals, probably at the next Semiannual Meeting.

The Public Relations Committee has been very active presenting radio, television and public talk shows. It is currently taking leadership in promoting the Tel-Med program on a statewide basis. Full details have not been completed as yet. This, again, speaks of the good the physicians in Maryland are performing for the benefit of the public—their patients.

These, then, are some of the highlights of the past year. The origins of many of these programs came before my term of office and, needless to say, the seeds of

other programs which will come to fruition in the next several years may have been planted. We will not know until the time comes and we see what evolves. I think we can all be proud of a group of dedicated physicians who give so much of their time in reaching these accomplishments.

We have also seen a tremendous growth in our Medical Library use, and many of the other services given by the staff of Med-Chi. This loyal group of *DEDICATED EMPLOYEES* certainly deserves our heartfelt thanks and gratitude because, believe me, without them—I have learned this year—we could not exist. Unselfishly in many, many ways, they have given of themselves for our good and for the good of our patients.

But enough of what has happened this year. In preparing this speech I had the opportunity to go over some data, aided by our Librarian, who did much of the research about how this Faculty came to be, what it is today and why we are here today. I think it is rather fascinating to go through some of these highlights.

Initially, the Faculty was established by an Act of the Maryland Legislature in 1798. It is interesting to note the purpose of the organization, which is: "To promote and disseminate medical and surgical knowledge throughout the state and to prevent citizens thereof from risking their lives in the hands of ignorant practitioners or pretenders to the healing art."

This Charter, as granted by the Maryland Legislature, provided the means of carrying out these charges. The Charter states that the Faculty is to elect a Board of Medical Examiners who will provide for the licensure of physicians. The Faculty is permitted to charge for the licenses and also empowered to investigate and fine those practicing without licenses. The income from the licenses and fines was to accrue to the Faculty. Regarding the charge to promote and disseminate medical and surgical knowledge throughout the state, the Faculty was given the power to act as it judged to be conducive to carrying out that charge. Interestingly, the members of the Faculty and their successors were declared to be one community, corporation and body politic forever by, and under the name of, the Medical and Chirurgical Faculty of the State of Maryland. These words are very important, as I will try to point out.

The First Annual Business Meeting was held in June, 1799. The main business at that time was election of officers and election of the Board of Medical Examiners. Constitution and bylaws were drafted and adopted. This meeting, incidentally, was held at the State House in Annapolis. In 1807, the College of Medicine of Maryland was founded, which eventually became the University of Maryland Medical School. This event occurred primarily because of the efforts of the Medical and Chirurgical Faculty. The Charter establishing the Medical School names the Medical and Chirurgical

Faculty membership as patrons and visitors of the college. The President of the Medical and Chirurgical Faculty was the Chancellor of the College. The members of the Board of Medical Examiners, elected by the Faculty, were trustees of the Medical College. The members of the Board of Medical Examiners, together with the President and professors, were charged to be "One community, corporation and body politic to have continuance forever by the name of the Regents of the College of Medicine of Maryland."

In the same year, the State was divided into seven districts. A district society was set up within each area. These were to be components of the Medical and Chirurgical Faculty. Things remained in that manner until 1839, when individual county medical societies throughout the

state were formed as components of the Medical and Chirurgical Faculty.

More importantly, about 1830, at the Annual Meeting of the Faculty, it was determined that everything possible had been done to prevent citizens from risking their lives at the hands of ignorant practitioners or pretenders to the healing art. Accordingly, it was decided to turn attention toward promoting and disseminating medical and surgical knowledge throughout the state. As a result of this charge in the Faculty Charter, a resolution was passed establishing a Library and a committee of five, to be called the Library Committee, appointed to purchase such periodicals and other standard works in medicine as it deemed proper to be placed in some suitable situation for the use of the members. The

Library first opened its doors on July 1, 1839 in the office of Dr. John Fonerdon, the first Librarian.

Also in 1839, the *Maryland Medical and Surgical Journal and Official Organ of the Army and Navy of the United States* began publication. Aside from occasional annual transactions, this was the Faculty's first attempt at a regular *Journal*.

In the same year, the Faculty passed a resolution recommending that delegates from all states meet together to form a National Medical Society. The Faculty appointed three delegates to assist in the formation of such a National Society and to represent the Faculty at the first meeting. This effort, initiated by the Faculty, was the beginning of the drive that led to the formation of the American Medical Association and its first annual convention, held in Baltimore in 1848 at the invitation of the Faculty; 1839 was a busy year. In that year, an Act of the Legislature authorized Thomasonian and Botanic physicians to charge and receive compensation for their services and medicines without being licensed. The effect of this Act was to revoke the 1798 Charter of the Faculty, because the Act stated: "It may and shall be lawful for each and every person in this state to charge and receive compensation for their services and medicine in the same manner as physicians are permitted to do." As a result of this Act, physicians ceased joining the Faculty and ceased applying for license, cutting off the Faculty's only source of income. It was not until almost 50 years later, in 1886, that, under the Presidency of Dr. John Quinan, that the Faculty was able to successfully establish the priority of its charter over the 1839 Act, based upon the important legal concept of *inviolate chartered rights*.

Some interesting high points: In 1857, the first Faculty Hall was established at 47 North Calvert St. Incidentally, a Museum and Library were with us at that time. The whole building cost \$3,425. In 1874, a State Board of Health was established as a result of lobbying by the Faculty. In 1881, a Library Building Committee was established, and this eventually led to our present Faculty Building on Cathedral St.

In 1882, the first black physician applied for membership in the Faculty and was unanimously elected. This was Dr. Whitfield Windsey, a graduate of Harvard University. That same year, two other black physicians were admitted. To show how up-to-date we were even then—in 1885, the Faculty's Constitution was amended so the words: "gentlemen" or "gentleman" were changed to "persons" and "person" allowing for admission of female physicians to the Faculty. ERA was here first!

In 1891, again, problems seemed to rise. After several years of effort by the Faculty to establish the State Board of Medical Examiners, a new law confirmed the Faculty's Charter of 1798, in that the Board was to be elected by the Faculty. The Board was financed by the Faculty

and the monies collected by the Board belonged to the Faculty. The State Board was actually organized in June, 1892 at an Annual Meeting of the Faculty which elected the first members of the Board. This 1891 law was a compromise on the part of the Faculty, in that a second Board of Examiners was to be elected by the State Homeopathic Society and was to have the power to license homeopathic physicians. It is only in recent times that the State Board of Homeopathic Examiners ceased to function.

In 1894, the 1891 Act was amended to require all practicing physicians to register at their county court house. The purpose of this was to give the Faculty a way of determining whether or not a practicing physician was licensed. All physicians practicing in Maryland on or before June 1, 1892 were automatically licensed. The Board of Medical Examiners continued to function for many years with its members unpaid, and the Faculty bearing the cost of operating the Board and prosecuting those who continued to practice or set up practice in violation of the Medical Licensure Act.

In 1896, the Frick Fund was set up; Also, Marcia Noyes was hired as the Faculty's first resident Librarian. She later assumed the duties of Executive Secretary as well, and served the Faculty until her death in 1946. In 1898, the Constitution of the Faculty was modified so that the Secretary of the Faculty became a salaried officer, beginning the move toward a supporting staff, upon which we depend now. In 1899, the Centennial of the Medical and Chirurgical Faculty brought a major membership drive. Through this drive, county societies were established in every county and close to 100% of the practicing physicians in Maryland became members.

Some other highlights show the Faculty Headquarters were dedicated in 1909. In 1946, Miss Noyes died, and her funeral was held in Osler Hall. She is the only individual who has been so honored.

Thus, in summary, I have given, I hope, a thumbnail sketch of what I consider to be the salient highlights of the Society. I think it is important that we realize in a day like today, that we are a unique group of individuals which have a power within the state to perform many of the duties which we have given over to the State. These duties are ones which, in essence, would help us to better fulfill our original Charter in combating the inroads of socialization, economic controls, and other insidious ideas and which, in non-medical hands, could lead to the complete subrogation of our time-honored profession.

Ladies and gentlemen, we have been given a Charter which, I understand, exists in perpetuity, cannot be revoked, that gives us the strength and the power to act. It also charges us with a very important duty—that we "promote and disseminate medical and chirurgical knowledge throughout the state and prevent citizens from risking their lives in the hands of ignorant practitioners or pre-

tenders to the healing art." Ladies and gentlemen, in this day of advocacy, we have many, many pretenders, and I think it is very important that we realize the most important sign or signs we see in our patients are those of their mental and physical illnesses, *NOT* those of the sociologists, economists and others who would tell us how to do what we know best to do. Thank you. □

DR. WELTY RECEIVES A. H. ROBINS AWARD: Louis S. Welty, MD of Easton has received the A. H. Robins Award for distinguished community service rendered by a physician above and beyond the call of duty. The Award was presented at the Med-Chi Presidential Banquet of the 181st Annual Meeting at Hunt Valley Inn.

In nominating Dr. Welty for the Award, Talbot County Medical Society President, Dr. Richard Stephenson, said: "Dr. Welty is an outstanding physician as well as an outstanding individual, and I personally cannot think of anyone who is more deserving of this recognition and Award." Dr. Welty is a graduate of Amherst College and received his Medical Degree and public health degree from Johns Hopkins University. He has served as County Health Officer for both Caroline and Talbot Counties. In that capacity, he was active in organizing the National Association of County Health Officials and the Maryland Conference of Local Health Officers. He was the first health officer in Maryland to use the Salk Polio vaccine to control an outbreak of Poliomyelitis. While President of the Easton Rotary Club in 1944, he brought to the County the first speaker at a public gathering to promote and explain the philosophy of Alcoholics Anonymous. From this beginning, there is now an alcoholic clinic in Easton and between 10-12 meetings per week in the county. Dr. Welty was instrumental in the establishment of two very active groups for children in need of assistance. The first, Bethany House, Inc., a network of group homes for potential juvenile offenders in the County, receives court-assigned children for rehabilitation. Youth, Inc. is a group of concerned citizens who organize seminars, a coffee house and recreational activities for high school youth. In the photo (by Tadder of Baltimore), Dr. Welty (right) receives the Award from Robins representative Dieter Scherer (left), while Faculty President Dr. Francis C. Mayle, Jr. (center) beams approval.

Arthur G. Siwinski

Also present were staff personnel.

Invocation

Leslie R. Miles, MD, Chairman of the Committee on Medicine and Religion gave the invocation.

Secretary of Department of Health and Mental Hygiene

Charles R. Buck, ScD, newly-appointed Secretary of the Department of Health and Mental Hygiene, spoke briefly, calling on the physicians to cooperate with the Department and also speaking for the Department, stated similar cooperation would be forthcoming from it. He also indicated there were many problems within the Department and he looked for assistance from the physicians of the state in solving them.

President's Remarks

The President then addressed the House on the activities taking place during his term of office and the progress that had been made in the past year.

Introduction of AMA Guest

The President introduced Daniel Cloud, MD, Treasurer and member of the AMA Board of Trustees, who spoke on the

national picture and also about the AMA's activities.

Visiting State Society Presidents

The following honored guests, Presidents of the Medical Societies indicated, were introduced:

Anthony Cucuzzella, MD, Medical Society of Delaware; Charles Epps, MD, District of Columbia Medical Society; and George Nipe, MD, Medical Society of Virginia

Semiannual Minutes

The minutes of the Semiannual Session of the House of Delegates, held in Ocean City, MD, on Sept. 15, 1979, having been distributed to all members and having been corrected and approved by the Executive Committee, were presented to the House for information.

Necrology

The members of the House of Delegates rose in observance of a moment's silence in respect for their deceased colleagues as the Secretary read the following necrology:

Allegany County

Memorial Resolutions

On motion of the Secretary, each individually, the following resolutions were adopted unanimously by the House:

M. McKendree Boyer, MD 1907-78

WHEREAS, M. McKendree Boyer, MD, of Damascus, MD, was taken from our midst on Dec. 28, 1978; and

WHEREAS, He had served his colleagues and the public in many capacities; as President of the Medical and Chirurgical Faculty, on countless Faculty and local society committees and as President of the Montgomery County Medical Society and

WHEREAS, He was loved and respected by all with whom he came into contact and

WHEREAS, His position in life will be impossible to fill and

WHEREAS, This House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland wishes to acknowledge his service to humanity therefore, be it

Resolved, That the House of Delegates goes on record as expressing its sorrow at this grievous loss to the profession and the public and

Resolved, That this resolution be spread upon the minutes of the House of Delegates meeting, May 2, 1979, and a copy be sent to Mrs. Helen Boyer, as a token of the esteem in which he was held.

Whitmer B. Firor, MD 1902-79

WHEREAS, Whitmer B. Firor, MD, one of the country's best known Radiologists, and an expert in his field, died on Jan. 18, 1979 and

WHEREAS, "Whit," as he was affectionately known by all of those with whom he came in contact, was an individual of distinction, compassion and understanding and

WHEREAS, He served as Faculty President in 1960-61, and also served in many other capacities, including the presidency of the Baltimore City Medical Society in 1958 and

WHEREAS, His death creates a void that is hard, if not impossible, to fill be it therefore

Resolved, That the House of Delegates of the Medical and Chirurgical Faculty goes on record as noting the death of one of its distinguished members and President and be it further

Resolved, That a copy of this resolution be sent to the wife of Dr. Firor with

**Marvin Frederick
Saiontz, MD
1938-79**

WHEREAS, The Howard County Medical Society members mourn with sorrow the death of Marvin Frederick Saiontz, MD, who had been active in its affairs from October, 1973 until his death on Feb. 15, 1979 and

WHEREAS, It is the wish of the Howard County Medical Society that Dr. Saiontz be recognized for the active part he played in Faculty and local society affairs, including service as an Alternate Delegate to the Faculty's House of Delegates and

WHEREAS, It is also the wish of the Howard County Medical Society and the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland that Dr. Saiontz's memory be honored be it

Resolved, That the House of Delegates goes on record as recognizing the passing of Dr. Saiontz and

Resolved, That a copy of this resolution be spread upon the minutes of the House session on May 2, 1979, and be sent to his wife and children on this occasion.

**I. Ridgeway Trimble, MD
1900-79**

WHEREAS, I. Ridgeway Trimble, MD, passed from this mortal life on Apr. 6, 1979 and

WHEREAS, He is the son of a famous and revered physician, becoming one himself, respected and dedicated in his own time and

WHEREAS, He did much to continue the compassion, and progress commenced by his father and carried on by the son and

WHEREAS, He served in many capacities not only within the medical profession, but in areas of social concern as well as his personal life and

WHEREAS, It is the desire of the Medical and Chirurgical Faculty of the

State of Maryland that he be recognized for these accomplishments be it

Resolved, That this organization formally goes on record as noting his death and at the same time expressing its sympathy and concern to the members of his family and be it further

Resolved, That this House of Delegates notes this sad occasion and spreads upon the minutes of the meeting on May 2, 1979 this resolution, with instructions that a copy be sent to his family.

**Edmund R. Novak, MD
1916-79**

WHEREAS, Edmund R. Novak, MD, died on Apr. 11, 1979 and

WHEREAS, Dr. Novak was a distinguished physician, professor and medical author and

WHEREAS, He was held in high esteem by his fellow-physicians, educators and the public and

WHEREAS, He came from a line of distinguished physicians, all of whom have left to their memory outstanding milestones in the practice of medicine and

WHEREAS, Dr. Novak will be sorely missed from the community and his position will be hard, if not impossible to fill and

WHEREAS, It is the desire of his colleagues that recognition be given to him by a memorial in the minutes of the House of Delegates of the Medical and Chirurgical Faculty for the contributions he made during his lifetime therefore, be it

Resolved, That this resolution be spread upon the minutes of the May 2, 1979, House session of the Faculty and a copy be sent to his relatives.

50-Year Members

Presentation of 50-year certificates and pins to the following members then took place, with the awards being mailed to those unable to attend the meeting:

Baltimore City

9-3 Saturday

after debate, on a division vote were adopted by greater than the 2/3 vote required:

(a) Amend Article IV, (Officers), Section 3, by striking out "15 days" and inserting "30 days."

(b) Amend Article IV, (Officers), Section 6, by adding the following sentence: "Councilors in each newly elected annual class shall assume their duties at the close of the Annual Session, immediately preceding which they were elected."

Dr. Ball, on behalf of the Bylaws Committee, moved adoption of the following bylaw amendment which, after debate, on a division vote, was adopted by greater than the 2/3 vote required:

Amend Article XI (Committees), Section 6, by substituting for it the following: "Section 6—A Medical Economics Committee of at least five members shall be appointed annually. It shall constantly review existing membership benefits other than insurance plans, making an annual report to the House of Delegates together with any recommendations it may have. It shall investigate new member benefit programs, (except for member insurance benefits), determine their acceptability to the members and proceed with implementation of the programs approved by the Faculty's governing bodies. Once such a program has been implemented, it shall be turned over to the committee of the Faculty charged with this responsibility or to the Med-Chi Services Agency, Inc., for operational purposes. Its chairman shall be appointed by the President and said Chairman shall appoint the other members of the committee with the approval of the President."

Dr. Ball, on behalf of the Bylaws Committee, moved adoption of the following bylaw amendment which, after debate and amendment, was adopted, on a division vote, by greater than the 2/3 vote required:

Amend Article XI (Committees), by substituting for Section 16 the following: "Section 16-A Legislative Committee shall consist of at least five members appointed by the President, one of whom the President shall designate as chairman, together with one member of each component society and specialty society, recognized by the Faculty, chosen by those societies annually. The Maryland State Dental Association shall have the right to choose one associate member of the committee with voice but without vote. The committee shall inform itself on all legislation, national, state and local, affecting the practice of medicine; advise the Faculty when necessary in regard to such legislation; and with the President or such other person as the Council or House of Delegates may name, represent the Faculty before any legislative body when required."

Bylaws Committee Instruction

Dr. Anderson, on behalf of the Baltimore City Delegation, offered a motion

that the Bylaws Committee consider and report an amendment to Article XI, Section 16, to require that "Voting members of the Legislative Committee be Active members of the Faculty in good standing." The motion was adopted.

Nominating Committee Report

John R. Davis, Chairman of the Nominating Committee, presented the following slate to the House of Delegates:

President-Elect

Vincent J. Fiocco, Jr. (President-Elect 1979-80; President 1980-81)

First Vice President

George S. Malouf, Hyattsville

Second Vice President

J. Roy Guyther, Mechanicsville

Third Vice President

Herbert H. Leighton, Oakland

Secretary

Bernard S. Karpers, Jr., Baltimore

Treasurer

Robert B. Goldstein, Baltimore

Committee on Program and Arrangements

(1979-82) Alva S. Baker, Westminster

(1980-84) Morton I. Rapoport, Baltimore

Library and History Committee

(1980-85) Eldon L. Hawbaker, Hagerstown

Finney Fund Committee

(1980-85) A. McGeehe Harvey, Baltimore

Board of Medical Examiners

(June, 1979 - June, 1983)

Chris Papadopoulos, Baltimore

(June, 1979 - June, 1983)

Manning W. Alden, Annapolis

Delegates and Alternates to the AMA

Delegate: Charles F. O'Donnell, Towson

(Jan. 1, 1980 - Dec. 31, 1982)

Alternate: Robert B. Goldstein, Baltimore

(Jan. 1, 1980 - Dec. 31, 1982)

Alternate: Francis C. Mayle, Jr., Bethesda

(May 5, 1979 - Dec. 31, 1981)

Nominations Closed

The floor was opened to further nominations for these offices and there were no nominations made. Nominations were closed by general consent. It was announced that the Board of Medical Examiners are to be elected at the General Session, May 3, 1979 at noon, at the Hunt Valley Inn, Hunt Valley, MD and the election of other positions will take place at the second meeting of the session, May 5, 1979 at 9 AM.

(Continued on page 53)

Tenuate®
(diethylpropion hydrochloride NF)

Tenuate Dospan®
(diethylpropion hydrochloride NF) controlled-release

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATION: Tenuate and Tenuate Dospan are indicated in the management of exogenous obesity as a short-term adjunct (a few weeks) in a regimen of weight reduction based on caloric restriction. The limited usefulness of agents of this class should be measured against possible risk factors inherent in their use such as those described below.

CONTRAINDICATIONS: Advanced arteriosclerosis, hyperthyroidism, known hypersensitivity, or idiosyncrasy to the sympathomimetic amines, glaucoma. Agitated states. Patients with a history of drug abuse. During or within 14 days following the administration of monoamine oxidase inhibitors. (hypertensive crises may result).

WARNINGS: If tolerance develops, the recommended dose should not be exceeded in an attempt to increase the effect; rather, the drug should be discontinued. Tenuate may impair the ability of the patient to engage in potentially hazardous activities such as operating machinery or driving a motor vehicle; the patient should therefore be cautioned accordingly. **Drug Dependence:** Tenuate has some chemical and pharmacologic similarities to the amphetamines and other related stimulant drugs that have been extensively abused. There have been reports of subjects becoming psychologically dependent on diethylpropion. The possibility of abuse should be kept in mind when evaluating the desirability of including a drug as part of a weight reduction program. Abuse of amphetamines and related drugs may be associated with varying degrees of psychologic dependence and social dysfunction which, in the case of certain drugs, may be severe. There are reports of patients who have increased the dosage to many times that recommended. Abrupt cessation following prolonged high dosage administration results in extreme fatigue and mental depression; changes are also noted on the sleep EEG. Manifestations of chronic intoxication with anorectic drugs include severe dermatoses, marked insomnia, irritability, hyperactivity, and personality changes. The most severe manifestation of chronic intoxications is psychosis, often clinically indistinguishable from schizophrenia. **Use in Pregnancy:** Although rat and human reproductive studies have not indicated adverse effects, the use of Tenuate by women who are pregnant or may become pregnant requires that the potential benefits be weighed against the potential risks. **Use in Children:** Tenuate is not recommended for use in children under 12 years of age.

PRECAUTIONS: Caution is to be exercised in prescribing Tenuate for patients with hypertension or with symptomatic cardiovascular disease, including arrhythmias. Tenuate should not be administered to patients with severe hypertension. Insulin requirements in diabetes mellitus may be altered in association with the use of Tenuate and the concomitant dietary regimen. Tenuate may decrease the hypotensive effect of guanethidine. The least amount feasible should be prescribed or dispensed at one time in order to minimize the possibility of overdose. Reports suggest that Tenuate may increase convulsions in some epileptics. Therefore, epileptics receiving Tenuate should be carefully monitored. Titration of dose or discontinuance of Tenuate may be necessary.

ADVERSE REACTIONS: **Cardiovascular:** Palpitation, tachycardia, elevation of blood pressure, precordial pain, arrhythmia. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride. **Central Nervous System:** Overstimulation, nervousness, restlessness, dizziness, jitteriness, insomnia, anxiety, euphoria, depression, dysphoria, tremor, dyskinesia, mydriasis, drowsiness, malaise, headache; rarely psychotic episodes at recommended doses. In a few epileptics an increase in convulsive episodes has been reported. **Gastrointestinal:** Dryness of the mouth, unpleasant taste, nausea, vomiting, abdominal discomfort, diarrhea, constipation, other gastrointestinal disturbances. **Allergic:** Urticaria, rash, ecchymosis, erythema. **Endocrine:** Impotence, changes in libido, gynecomeastia, menstrual upset. **Hematopoietic System:** Bone marrow depression, agranulocytosis, leukopenia. **Miscellaneous:** A variety of miscellaneous adverse reactions has been reported by physicians. These include complaints such as dyspnea, hair loss, muscle pain, dysuria, increased sweating, and polyuria.

DOSAGE AND ADMINISTRATION: Tenuate (diethylpropion hydrochloride): One 25 mg. tablet three times daily, one hour before meals, and in mid-evening if desired to overcome night hunger. Tenuate Dospan (diethylpropion hydrochloride) controlled-release: One 75 mg. tablet daily, swallowed whole, in midmorning. Tenuate is not recommended for use in children under 12 years of age.

OVERDOSAGE: Manifestations of acute overdose include restlessness, tremor, hyperreflexia, rapid respiration, confusion, assaultiveness, hallucinations, panic states. Fatigue and depression usually follow the central stimulation. Cardiovascular effects include arrhythmias, hypertension or hypotension and circulatory collapse. Gastrointestinal symptoms include nausea, vomiting, diarrhea, and abdominal cramps. Overdose of pharmacologically similar compounds has resulted in fatal poisoning, usually terminating in convulsions and coma. Management of acute Tenuate intoxication is largely symptomatic and includes lavage and sedation with barbiturate. Experience with hemodialysis or peritoneal dialysis is inadequate to permit recommendation in this regard. Intravenous phenolamine (Regitine®) has been suggested on pharmacologic grounds for possible acute, severe hypotension, if this complicates Tenuate overdose.

Merrell

B-3921 (1987A)

**Overweight may not always be simple...
complications can develop*.
Complicated or not...**

Tenuate[®] Dospan[®] ^{IV} **(diethylpropion hydrochloride NF)** **75 mg. controlled-release tablets**

A useful short-term adjunct in an indicated weight loss program.

Overweight patients in certain diagnostic categories often require strict appetite control and a successful program of weight reduction may tend to diminish the incidence or severity of the complications in some patients. Diethylpropion hydrochloride has been reported useful in such patients and while it is not suggested that Tenuate itself in any way reduces the complications of overweight, it may have a useful place as a short-term adjunct in a prescribed dietary regimen. **Tenuate should not be administered to patients with severe hypertension; see additional Warnings and Precautions on the opposite page.**

In uncomplicated overweight.

Many patients, on the other hand, present with excess fat but no disease. While this condition is often termed uncomplicated obesity, complications of both a social and a psychologic nature may be distressingly real for the patients. In these cases, a short-term regimen of Tenuate can help reinforce your dietary counsel during the important early weeks of an indicated weight loss program.

Clinical effectiveness.

The anorectic effectiveness of diethylpropion hydrochloride is well documented. No less than 16 separate double-blind, placebo-controlled studies attest to its usefulness in daily practice.¹ And the unique chemistry of Tenuate provides "...anorectic potency with minimal overt central nervous system or cardiovascular stimulation."² Compared with the amphetamines, diethylpropion has minimal potential for abuse.

**Tenuate—it makes sense.
And it's responsible medicine.**

*Studies have shown that obesity is associated with an increased incidence of hypertension, symptomatic heart disease, adult-onset diabetes, and other diseases.

Present also were staff personnel.

Election of Officers

The President advised the members that the following had been elected to the Board of Medical Examiners at the General Session held on May 3, 1979 at the Hunt Valley Inn, at Noon:

Manning W. Alden, MD, Annapolis
(June, 1979 - June, 1983)

Chris Papadopoulos, MD, Baltimore
(June, 1979 - June, 1983)

There having been no nominations from the floor and there being only one candidate for each office to be filled, by

unanimous consent, the ballot was dispensed with. The following were then elected by acclamation:

President-Elect

Vincent J. Fiocco, Jr. (President-Elect 1979-80) (President 1980-81)

First Vice President

George S. Malouf, Hyattsville

Second Vice President

J. Roy Guyther, Mechanicsville

Third Vice President

(1980-85) A. McGehee Harvey, Baltimore

Delegates and Alternates to the AMA Delegate: Charles F. O'Donnell, Towson

(January 1, 1980-December 31, 1982)

Alternate: Robert B. Goldstein, Baltimore

(January 1, 1980-December 31, 1982)

Alternate: Francis C. Mayle, Jr., Bethesda

(May 5, 1979-December 31, 1981)

MMPAC Report

Richard F. Moschell, MD, Chairman of the Maryland Medical Political Action Committee, made a report to the House which is included in the Annual Reports.

Auxiliary Report

Mrs. Kassie Herbert, Auxiliary President, made a verbal report to the House and her remarks will be contained in the Annual Reports.

Resolution 1A/79 Adopted as Amended

The Secretary reported Resolution 1A/79 offered after the deadline by Dr. Mulholland, on behalf of the Baltimore City Medical Society Delegation. There being 2/3 in favor on a division vote, the House ordered that Resolution 1A/79 be considered. After debate and amendment, Resolution 1A/79, was adopted as follows:

WHEREAS, Alcoholism is a leading cause of morbidity and mortality in the State of Maryland and

WHEREAS, It is reported that from 10-13% of the citizens of Maryland suffer from alcoholism, which disease has been declared by the City of Baltimore to be its major public health problem and

WHEREAS, Most alcoholics (97%) are employed or are employable, reside with

FIRST PLACE AWARD FOR A TECHNICAL EXHIBIT AT THE ANNUAL MEETING AT HUNT VALLEY INN went to the Chesapeake and Potomac Telephone Co., and was presented by Dr. Herbert J. Levickas, Med-Chi Program Committee Chairman (left) to Marion Connolly Zipfel.

SECOND PLACE AWARD FOR A TECHNICAL EXHIBIT AT THE FACULTY'S ANNUAL MEETING AT HUNT VALLEY INN went to Roche Laboratories. Seen from left to right are: Program Committee Chairman Dr. Herbert J. Levickas presenting the Award to Roche staffers Ron Hardnock, Archie Baluyut and Vaseem Iftekhar.
(Photo by Tadder, Balto.)

their families and are covered by some form of health insurance which, in most instances, does not cover treatment for alcoholism as such and

WHEREAS, Treatment of alcoholism itself is more cost-efficient than treatment for those end stage diseases resulting from chronic alcoholism and

WHEREAS, A recent study of major industries in other states where insurance coverage is provided for alcoholism treatment shows savings of 55% in health insurance expenditures for medical conditions caused by untreated alcoholism and

WHEREAS, Some health insurance carriers in Maryland offer coverage for such treatment in their group policies but few groups purchase this option and

WHEREAS, Alcoholism has been declared an illness with psychologic and organic factors by the American Medical Association and by the Medical and Chirurgical Faculty of the State of Maryland and is so listed in ICD-9-CM and CPT-4, yet major insurance carriers utilize only psychiatric fiscal criteria in computing costs of alcoholism coverage therefore, be it

Resolved, That the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland goes on record as urging all health insurance carriers doing business in this State to provide coverage for inpatient, residential and outpatient treatment of alcoholism as a basic benefit in its contracts and be it

Resolved, That although it is recognized benefits for alcoholism treatment cannot become a part of the basic benefit insurance package immediately, health insurance carriers are urged to aggressively market the alcoholism treatment benefit option in all policies currently sold in Maryland and be it

Resolved, That all health insurance carriers be urged to change their procedures so that alcoholism is underwritten as a medical condition and be it

Resolved, That copies of this resolution be sent to Maryland Blue Cross, Inc., Maryland Blue Shield, Inc., the Health Insurance Association of America, the Maryland Chamber of Commerce and the State Insurance Commissioner.

Transfer of Office

There being no further business to come before the House, the President turned the gavel over to the incoming President, William A. Pillsbury, Jr., MD, who called upon John R. Davis, MD, Immediate Past President, to present to the outgoing President a medallion and ribbon as a memento of his term of office.

The House rose and gave a standing ovation to Dr. Mayle, as he retired from the podium.

There being no further business to come before the House, by unanimous consent, it adjourned sine die at 9:45 AM.

**The MPP Nurse.
A Special Person.**

All the nurses who work for Medical Personnel Pool are special. What makes them so special? Being a skilled professional and being associated with other professionals with extremely high standards of excellence. Knowing their skills will be fully utilized by MPP staff's careful assignment matching. And also, very importantly, by being able to devote as much time to their nursing career as they wish without sacrificing their personal lives.

MPP's concept of flexible scheduling allows our employees to work as many hours as they wish or as little on the days and weeks convenient to their individual schedule. Everyone benefits as valuable nursing skills which would otherwise be lost are being provided for patient care.

A flexible schedule is only one of the many benefits that await you when you work for Medical Personnel Pool, one of the most highly respected nursing services in its field. Choice of assignments, extensive insurance coverage including professional and general liability and worker's compensation insurances, in-service education, competitive salary, and a reputation for high standards are just a few of the others.

To learn more about the many opportunities awaiting you at Medical Personnel Pool, stop by your local MPP office.

REPORT OF THE FACULTY'S DELEGATES TO THE AMA HOUSE OF DELEGATES DEC. 3-6, 1978

Mr. President and Members of the House of Delegates:

The Interim Meeting of the American Medical Association's House of Delegates, which concluded in Dec. 6, 1978, begins a policy whereby Interim Sessions will be held in December, but will be rotated to different locations throughout the United States. Annual Sessions will consistently be held in Chicago.

The AMA House currently consists of 271 delegates from 55 states and territories and more than 50 national specialty societies. The House also includes one voting delegate from the medical students, housestaff, medical schools and the services, i.e., the Army, Air Force, Navy, VA and Public Health Service. About 200 items of business were considered and this particular meeting presented many difficult and far-reaching decisions for your delegates. Those actions will have a decided impact on the future course of the Association and on each individual physician.

As has been the custom, members of the Faculty delegation to the AMA and staff were assigned to various Reference Committees. All physicians, whether AMA members or not, may speak to issues coming before such Reference Committees. As usual, debate was intense on some issues, and, in some cases, the Committees deliberated until the early hours of the morning. The Reference Committees and the House Sessions offered every opportunity for open discussion on the national issues affecting each individual physician.

Chiropractic

The AMA is currently involved in three litigation issues regarding Chiropractic. The Pennsylvania suit is filed as a class action on behalf of all chiropractors who are seeking freedom to gain access to laboratory and radiology facilities and services, and to have reports on such diagnostic procedures performed for their patients in their order. The Pennsylvania suit charges the AMA and several other organizations with conspiracy to prevent chiropractors from practicing their profession as provided by state law.

After much time and legal expense, all parties had agreed to settle the suit except the Pennsylvania Radiological Society and the American College of Radiology. In an effort to delay the settlement, two delegates, at the request of four specialty organizations, filed suit challenging the authority of the Board of Trustees to enter into a settlement agreement without concurrence by the House of Delegates.

In a rare closed meeting of the House, consideration of several resolutions regarding this issue were held. The House

acknowledged and affirmed the authority of the Board of Trustees to settle the lawsuit. The House also called on the AMA to "Continue to warn the public of hazards to health of entrusting the diagnosis and treatment of diseases such as cancer, diabetes, malignant hypertension, cardiovascular stroke and infections to practitioners who, in the treatment of these conditions, rely upon the theory that all disease is caused by misalignment of spinal vertebrae and can be cured by manual manipulation of the spine." In related action, the House also supported the physician's right to exercise this choice by the terms of contractual arrangements with other physicians, medical groups, hospitals or other institutions. It was also stated that a physician's obligations to provide information to a patient or any other party are those required by customary good medical practice and law. The Judicial Council was requested to reconsider Article 3.70 of Section III of Judicial Council *Opinions and Reports*. This Article states that physicians may accept or decline patients sent to them by limited practitioners or by laymen. It also states the role of specialists in providing information to such patients if they choose to provide services. It is emphasized that none of these actions should be construed as an amendment to the AMA's Principles of Medical Ethics.

We left the Chicago meeting hoping the misunderstandings surrounding the controversy had been resolved and that the damaging divisiveness generated by this highly-emotional issue was behind us.

National Health Insurance

The Association's position on NHI was once again a major topic for debate. Looking ahead to the new Congress and expiration of all current NHI proposals, the delegates considered several resolutions and reports to establish current AMA policy.

In a major change in policy, the House turned down the recommendation of the Association's board and Councils on Legislation and Medical Service and the Reference Committee that the AMA introduce into Congress early next year the "Health Insurance Improvement Act of 1979." This proposal would have marked the ninth consecutive year the AMA has had before Congress a bill to provide basic insurance benefits for all Americans, and the Reference Committee urged the House to approve it, citing that, "It is essential for the Association to continue to have before the Congress—in the interest of the public—a proposal offering a private sector approach building on the strengths of our present health care delivery system."

In final action on the NHI issue, the House voted to recommend to Congress modifications of the health care system and that the AMA sponsor legislation, if necessary, embodying these principles:

1. Requiring minimum standards of adequate benefits in all health insurance policies sold in the United States with

appropriate deductible and coinsurance.

2. A simple system of uniform benefits provided by the Federal, State and local governments for those individuals who are unfortunate enough (through no fault of their own, i.e., age, disability, financial hardship, etc.) not to be able to provide for their own medical care.

3. A nationwide program by the private insurance industry of America (and government, if necessary, for reinsurance) to make available catastrophic insurance coverage for those illnesses and individuals where the economic impact of a catastrophic illness could be tragic. All catastrophic coverage should have an appropriate deductible and co-insurance to make it economically feasible and to avoid abuse.

4. A program developed pursuant to these principles should be administered at the state level with national standardization through Federal guidelines.

Medical Ethics

The proposed revision of the Principles of Medical Ethics continues to receive much attention from members of the House. At the Annual Meeting in June, the House established an ad hoc committee to give the proposal more study and to present its recommendations to the House. At the Interim Meeting, the ad hoc committee reported that it was not yet prepared to make a final report and asked for authorization to continue its work for a report at the 1979 Annual Meeting. The House granted the Committee the additional time.

Second Opinions

By adopting a report from the Council on Medical Service, the AMA went on record opposing the concept of mandatory second opinions or the imposition of financial penalties by a third-party payor for not obtaining a second opinion. The House reaffirmed policy that supports the concept that, when a second opinion is required by a third-party payor, that opinion should be at no cost to the patient. The delegates also reaffirmed the right of a patient or a physician to seek a second opinion freely from any physician of his/her choice.

The report concluded that the Council on Medical Service has been no conclusive evidence that these programs will overcome the long run favorable impact on the quality, appropriateness and the accessibility or costs of care.

Voluntary Effort

The cost of medical care and the profession's commitment to restrain cost increases was a theme of several reports and resolutions. Many of these reports were stimulated by the recommendations of the National Commission on the Cost of Medical Care and AMA President Dr. Tom E. Nesbitt's call for voluntary restraint in physician fee increases. In a series of actions directed at controlling costs, the House of Delegates urged hos-

pital medical staffs to establish standing committees to provide recommendations for cost containment without compromising quality care. A recommendation was directed to the Carter Administration asking that the government contain health care costs by reducing the number of regulations. The expanded study by the Health Insurance Industry of the effects of cost-sharing of benefits on both consumer and provider behavior was encouraged. Finally, the House urged all physicians, when admitting patients to hospitals, to send pertinent abstracts of the patients' medical records so that the hospital physicians sharing in the care of those patients can practice more effective and better medical care.

Miscellaneous Business

With concern for fundamental fairness

and rudimentary procedural protection, a resolution was adopted which provides for the development of Guidelines for Due Process. These guidelines will be designed specifically for physicians for use in various situations encountered in hospitals, medical schools, medical societies and other areas.

In the area of Health Planning, there was support for the development of rational criteria by state and local planning bodies for placement of expensive facilities and equipment. If national guidelines are developed to assist states and localities in such activity, the guidelines should be advisory and should be developed only with the cooperation of physicians and other health professionals.

Preventive health measures and health education received continued endorsement by the adoption of various resolutions

from state medical associations. The House of Delegates voted to commemorate the International Year of the Child (1979) by endorsing the use of seatbelts and other vehicular restraints for infants and children. A proposal for expansion of child immunization programs generated considerable debate because of a provision that a compensation mechanism should be developed for patients who suffer vaccine-related injuries. This resolution, which proposed immunity from liability for those who administer vaccinations, as well as the manufacturer of vaccinations, was referred to the Board of Trustees for further study.

Confusion over whether state medical associations have authority to accredit continuing Medical Education programs was clarified with endorsement by the House of Delegates of statewide accreditation by state medical organizations. The AMA affirmed the concept of accreditation of CME programs by state associations whose CME standards meet those of the AMA or the standards of the Liaison Committee on CME. Subsequently, this will require changes in LCCME bylaws allowing accrediting by state societies with such standards meeting AMA approval.

In an attempt to address the serious problem of increased government regulations, the House voted to establish a public forum, in cooperation with other interested groups, to develop methods of minimizing government involvement and the subsequent deleterious effect on the American public.

The AMA continues in its excellent financial position and bases this success on strong financial performance and control; however, the Reference Committee alerted the House to the approach of 1981 when, at the current level of AMA activity and projected rates of inflation, expenses will begin to exceed income. This pattern was projected in the financial plan of 1975 and it appears that the AMA may not be able to avoid a dues increase in 1981. The leaders of state and county medical societies are urged to address the challenges of membership recruitment with new urgency and purpose during the coming year. Only 1,300 physicians became new full dues-paying members during 1978; however, an encouraging factor in membership recruitment is the continued increase in the number of medical students and residents who are joining the AMA.

Your Delegates and Alternate Delegates urge that you relate to us your viewpoint on the issues affecting your practice so that these can be brought to the House.

LEGISLATIVE 1978-79

Mr. President and Members of the House of Delegates:

The 1979 session of the Maryland General Assembly studied a number of issues that have been considered in the past. Because the entire Legislature stood for election in 1978, there were no summer hearings and a short, 30-day prefilming period just prior to the opening of the session in January, 1979. Many of the new legislators showed both a lack of depth in medical issues and a hostility toward the profession. Physicians as a group were often criticized for failing to be responsive to their patients. The Committee developed, introduced and testified on several bills this year. The major ones are listed herein.

HSCRC

The Faculty sponsored legislation which would have clearly stated that the Health Services Cost Review Commission has no jurisdiction over the physicians' services, tenure, compensation or fees. The Senate amended the bill on the floor adding, "unless, and to the extent the compensation or fees are established by the hospital, for services which are traditionally provided by the hospital or are administrative in nature." The bill, amended to include this language, was unacceptable to the Faculty. After passing the Senate, the bill failed in the House Environmental Matters Committee.

Physicians-Specialization Advertising

After several years of development, a bill was introduced providing that physicians who wish to be identified as specialists submit their qualifications to the Board of Medical Examiners. Upon acceptance of the credentials, the Board will issue a certificate of identification. The bill was enacted and will take effect July 1, 1980.

Indoor Air Preference Act

The Preventive Medicine and Public Health Committee provided the impetus for this bill, which was introduced in both houses of the Legislature. The bill required smoking and nonsmoking areas be delineated in all indoor public areas. For the first time in Maryland, the bill was passed by the Senate; however, it failed in the House of Delegates.

Right to Die

The Maryland Legislature once again considered this measure which would establish a "living will" for patients. The bill failed in the Senate Finance Committee. Faculty members testified to the effect that the final decision rests with the physician, patient and family at the time of necessity, rather than prospectively.

Ophthalmological Legislation

Optometrists worked very hard to pass legislation which would permit the use of diagnostic agents in the eye. After very intense legislative activity on both sides, the bill passed the Senate, but failed in the House Environmental Matters Committee. Ophthalmologists introduced a bill that would have required optometrists to refer any patient with vision uncorrectable to 20/40 to a physician. This bill failed in the House committee where it was introduced.

Allied Health Personnel

Nurse practitioners won the right to be reimbursed by third-party payors on an optional basis in a bill worded much the same as the bill passed in 1978 providing for benefits for nurse midwives. Insurance companies may require the nurse practitioner to work under the supervision of a physician. Podiatrists petitioned for a change in the definition of their practice. As a result, they will be able to amputate toes, but still must refrain from using anesthetics, performing tarsal osteotomies and triple arthrodesis. In another action, hospitals which render medical or surgical care of the foot will have to amend bylaws to allow podiatrists to apply for staff privileges. Psychologists, jointly with psychiatrists, will be permitted to admit patients to hospitals. Physical therapists will no longer be required to see patients only on referral but when referred, must act within the orders of the referring physician.

Gun Control Legislation

At the request of the Faculty's House of Delegates, the Committee met on July 19th to discuss the possibility of introducing legislation to limit the use of hand-

guns in Maryland. Following testimony presented to the Committee, they met and recommended that "Since there are sufficient laws on the books already involving gun control, the Legislative Committee recommends that there is no need for this resolution." This conclusion was submitted to the House of Delegates at the Semiannual Meeting in September. The House upheld the recommendation of the Committee.

Legislative Communications

The periodic conference call with representatives from throughout the state was replaced by a weekly newsletter called the *Assemblyman Update* which was mailed to Legislative Committee members, Chairmen of Faculty committees, officers and others. The *Update* edition seemed to be a very successful tool for communication among Faculty members. In addition, three issues of the *Assemblyman* were published and an *Assemblyman Supplement*, listing final action on all bills monitored by the Faculty during the legislative session. The telephone Hot Line daily tape-recorded messages about current legislation and was in service throughout the session; however, the number of calls received dropped substantially on the two statewide WATS line.

First-Aid Room

Once again, the Maryland Academy of Family Physicians provided medical coverage for the First-Aid Room in Annapolis. The facility was staffed full-time by nurses Rose Argiro and Carolyn McCoy. A total of 953 patients was seen and 58 physicians volunteered their time to serve.

The Chairman extends his grateful thanks both to the members of the Committee for their continued interest and

THIRD PLACE AWARD FOR A SCIENTIFIC EXHIBIT AT THE ANNUAL MEETING AT HUNT VALLEY went to *Pitfalls of Stoma Placement*, from the University of Maryland's Departments of Surgery and Nursing. Accepting the Award from Dr. Herbert J. Levickas, Med-Chi Program Chairman, (left) was Jennifer Spear, RN.

LIAISON COMMITTEE WITH DEPARTMENT OF HEALTH AND MENTAL HYGIENE ON MEDICAID PROGRAM

*Mr. President and Members of the House
of Delegates:*

This past year continued to be one of frustration for members of your Commit-

tee. Progress is agonizingly slow in moving the bureaucracy to work. The only concrete accomplishment that can be pointed to this year is adoption by the Medicaid program of the Current Procedural Terminology Codes for Medicaid billing purposes. Over 2,000 individual copies of the AMA CPT-4 Guide have been made available to physicians and others throughout the state in order to effect this conversion. The main objective of the AMA CPT-4 guide in the Medicaid system is to provide statistical data and to assist in changes in fee payments.

Problems involving the following areas were satisfactorily resolved with all parties:

1. Definition of Physician/Consultant under the program
2. Regulation on payment of X-rays in the practicing physician's office
3. Agree to a ban on anorectic drugs for weight-control in Medicaid patients
4. Agreed to the utilization of private practicing pediatricians in the EPSDT program
5. Resolved a problem involving payment to podiatrists for services they are authorized to perform under law so that physicians would be paid no less than the podiatrists are paid.
6. The Carroll County Study involving primary care at 80% of the usual and customary fees has not produced significant data to date. Unfortunately at the

time of this report, this program will not be funded by the Department of Health, Education and Welfare.

Payments under the Medicaid program to physicians in Maryland continue to be among the lowest in the entire United States. Despite our attempts to improve this by meeting with the Budget Bureau, the Secretary of the Department of Health and Hygiene and Ms Ann Hull, the Governor's Consultant on Health and Women, we can see no visible route to improvement, other than the current increase in office visit fees to \$8 per visit. Adjustments are made in fees for surgery and other procedures as funds become available for this purpose.

It is heartening to know, however, that the Conference for Social Concern and the Central Maryland HSA have both gone on record as urging an upgrading in the private physicians' office visit fee. These groups recognize that patients will continue to be seen in hospital settings at charges ranging as high as \$60 per visit unless and until the program provides payment on a reasonable basis.

Despite the difficulties encountered, your Committee will continue to work towards an effective method of reimbursement that will attract the largest number of physicians to participate, consistent with the high quality of medical care provided to Maryland citizens.

KARL M. GREEN, MD
Chairman

CURRENT CONCEPTS IN DIAGNOSIS AND TREATMENT OF RETINAL AND EXTERNAL OCULAR DISEASE

SEPTEMBER 18, 1979

Will be presented at the
MEDICAL SCHOOL TEACHING FACILITY
University of Maryland at Baltimore
by the
Department of Ophthalmology
and the
✚ Program of Continuing Education
University of Maryland School of Medicine

This course is designed as a review of retinal and infectious disorders of the eye as well as to cover recent diagnostic and therapeutic advances in these two areas, e.g., ultrasound, stereo-fluorescein, specular microscope, special culture techniques, vitrectomy, continuous wear contact lenses, and microsurgical techniques.

For additional information contact:

SERIOUS RUNNERS RUN ATHLETIC ATTIC

FOR SERIOUS RUNNERS.

Running is our life. Just as it is yours. We are serious runners. We are Marty Liquori, Greg Fredericks, Ken Schappert, Jeff Howser, Mel Pender, Steve Foster, and many more. In fact, the great majority of our stores are managed by accomplished athletes.

We founded Athletic Attic to provide top quality gear to serious runners like ourselves. And like yourself.

We've been to that breaking point. We've run those hundred mile weeks. So when we select a product for our shelves, we go about it very seriously. And we apply our experience thoroughly.

The result — Athletic Attic consistently has the best selection of running shoes and equipment available anywhere. So if you're serious about running at your best, come to Athletic Attic. We've got what you're looking for. Seriously.

BYLAWS COMMITTEE

Mr. President and Members of the House of Delegates:

Your Bylaws Committee met on March 9, 1979, and recommends the following Bylaws amendments:

1. (a) Amend Article IV (Officers), Section 3, by striking out "15 days" and inserting "30 days."

(b) Amend Article IV (Officers), Section 6, by adding the following sentence: "Councilors in each newly elected annual class shall assume their duties at the close of the Annual Session, immediately preceding which they were elected."

Old

Section 3. One-third of the COUNCILORS shall be elected annually by the component societies from among their active and 40-year members who have had some previous active service at the component or Faculty level. Each component society shall be represented by one Councilor for the first 200 active or 40-year members or less and one additional Councilor for each additional 200 active or 40-year members or fraction thereof as determined annually on Dec. 31. Component Societies which are to elect Councilors shall do so by majority vote in a membership election. The results of the election shall be reported to the Faculty at least (15) days before the Faculty's annual session.

New

Section 3. One-third of the COUNCILORS shall be elected annually by the component societies from among their active and 40-year members who have had some previous active service at the component or Faculty level. Each component society shall be represented by one Councilor for the first 200 active or 40-year members or less and one additional Councilor for each additional 200 active or 40-year members or fraction thereof as determined annually on Dec. 31. Component Societies which are to elect Councilors shall do so by majority vote in a membership election. The results of the election shall be reported to the Faculty at least 30 days before the Faculty's annual session.

Section 6. ELECTIVE OFFICERS EXCEPT COUNCILORS shall hold office for a term of one year or until their successors are elected. Councilors shall hold office for a term of three years or until their successors are elected, provided that they may not serve more than two consecutive terms. Elective officers, except councilors, shall assume their duties at the close of the annual session one year after their election, except that the President-Elect shall assume that office at the close of the annual session at which he is elected.

Section 6. ELECTIVE OFFICERS EXCEPT COUNCILORS shall hold office for a term of one year or until their successors are elected. Councilors shall hold office for a term of three years or until their successors are elected, provided that they may not serve more than two consecutive terms. Elective officers, except councilors, shall assume their duties at the close of the annual session one year after their election, except that the President-Elect shall assume that office at the close of the annual session at which he is elected. COUNCILORS IN EACH NEWLY ELECTED ANNUAL CLASS SHALL ASSUME THEIR DUTIES AT THE CLOSE OF THE ANNUAL SESSION, IMMEDIATELY PRECEDING WHICH THEY WERE ELECTED.

The above change would clarify time when Councilors, elected by Component Medical Societies, would take office, and extend the period prior to the annual meeting by which such councilors' names are filed with the Faculty office.

2. Amend Article XI (Committees), Section 6, by substituting for it the following: "Section 6—A Medical Economics Committee of at least five members shall be appointed annually. It shall constantly review existing membership benefits other than insurance plans, making an annual report to the House of Delegates together with any recommendations it may have. It shall investigate new member benefit programs (except for member insurance benefits), determine their acceptability to the members and proceed with implementation of the programs approved by the Faculty's governing bodies. Once such a program has been

implemented, it shall be turned over to the committee of the Faculty charged with this responsibility or to the Med-Chi Services Agency, Inc., for operational purposes. Its Chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President."

Old

(All deleted)

Section 6. A MEDICAL ECONOMICS COMMITTEE of at least five members shall serve as a Review Committee for health insurance and other third party payors to determine equitable and just fees for procedures performed and for which such carriers are responsible. It may only act on the request of the carrier or patient or physician involved, and after the medical service has been rendered. It shall not determine the legal rights or benefits under such policies. It shall also be empowered to investigate, within the responsibilities and charges designated in these bylaws, areas of economic benefits for members of the Faculty. It shall receive the report of the Faculty's officially approved Professional Liability Program and shall prepare and present an educational program to physicians in this regard. Its Chairman shall be appointed by the President and said chairman shall appoint the other members of the Committee with the approval of the President. The Maryland State Dental Association shall have the right to elect one associate member of the Committee with voice but no vote.

This change would broaden the responsibilities and change them so they conform to the current and potential areas of concern for Faculty members.

3. Amend Article XI (Committees), by substituting for Section 16 the following: "Section 16—A Legislative Committee shall consist of at least five members appointed by the President, one of whom the President shall designate as Chairman, together with one member of each component society and state-wide specialty society chosen by those societies annually. The Maryland State Dental Association shall have the right to choose one associate member of the committee with voice, but without vote. The committee shall inform itself on all legislation, national, state and local, affecting the practice of medicine; advise the Faculty when necessary in regard to such legislation and with the President or such other person as the Council or House of Delegates may name, represent the Faculty before any legislative body when required."

Old

Section 16. A LEGISLATIVE COMMITTEE composed of at least five members appointed by the President shall inform itself on all legislation, national, state and local, affecting the practice of medicine; advise the

New

Section 6. A MEDICAL ECONOMICS COMMITTEE OF AT LEAST FIVE MEMBERS SHALL BE APPOINTED ANNUALLY. IT SHALL CONSTANTLY REVIEW EXISTING MEMBERSHIP BENEFITS OTHER THAN INSURANCE PLANS, MAKING AN ANNUAL REPORT TO THE HOUSE OF DELEGATES TOGETHER WITH ANY RECOMMENDATIONS IT MAY HAVE. IT SHALL INVESTIGATE NEW MEMBER BENEFIT PROGRAMS (EXCEPT FOR MEMBER INSURANCE BENEFITS), DETERMINE THEIR ACCEPTABILITY TO THE MEMBERS AND PROCEED WITH IMPLEMENTATION OF THE PROGRAMS APPROVED BY THE FACULTY'S GOVERNING BODIES. ONCE SUCH A PROGRAM HAS BEEN IMPLEMENTED, IT SHALL BE TURNED OVER TO THE COMMITTEE OF THE FACULTY CHARGED WITH THIS RESPONSIBILITY OR TO THE MED-CHI SERVICES AGENCY, INC., FOR OPERATIONAL PURPOSES. ITS CHAIRMAN SHALL BE APPOINTED BY THE PRESIDENT AND SAID CHAIRMAN SHALL APPOINT THE OTHER MEMBERS OF THE COMMITTEE WITH THE APPROVAL OF THE PRESIDENT.

Section 16. A LEGISLATIVE COMMITTEE SHALL CONSIST OF AT LEAST FIVE MEMBERS APPOINTED BY THE PRESIDENT, ONE OF WHOM THE PRESIDENT SHALL DESIGNATE AS

Faculty when necessary in regard to such legislation; and, with the President or such other person as the Council or House of Delegates may name, represent the Faculty before any legislative body when required. The President shall designate the chairman. The Maryland State Dental Association shall have the right to elect one associate member of the committee with voice but without vote. The President shall request each component society annually to appoint a representative to meet with the committee on a consulting basis at the request of the Chairman of the committee.

CHAIRMAN, TOGETHER WITH ONE MEMBER OF EACH COMPONENT SOCIETY AND STATE-WIDE SPECIALTY SOCIETY CHOSEN BY THOSE SOCIETIES ANNUALLY. THE MARYLAND STATE DENTAL ASSOCIATION SHALL HAVE THE RIGHT TO CHOOSE ONE ASSOCIATE MEMBER OF THE COMMITTEE WITH VOICE BUT WITHOUT VOTE. THE COMMITTEE SHALL INFORM ITSELF ON ALL LEGISLATION, NATIONAL, STATE AND LOCAL, AFFECTING THE PRACTICE OF MEDICINE; ADVISE THE FACULTY WHEN NECESSARY IN REGARD TO SUCH LEGISLATION; AND WITH THE PRESIDENT OR SUCH OTHER PERSON AS THE COUNCIL OR HOUSE OF DELEGATES MAY NAME, REPRESENT THE FACULTY BEFORE ANY LEGISLATIVE BODY WHEN REQUIRED.

The above changes will provide for full voting rights of Component Society and Specialty Society members selected by these groups to represent them on the Legislative Committee and also provide official representation on the same committee of Specialty Societies, who will also have full rights in this group.

The Bylaws Committee referred several items to the Policy and Planning Committee for its consideration and report to the appropriate body. These are:

Possible formation of a new committee on Membership

Possible formation of a new committee on Private Practice

Possible change in the bylaws that would permit individual physicians to determine the component society through which they would obtain membership in the Faculty. Present bylaws require the physician to live or practice in the area in which he holds membership. The Baltimore City Medical Society has suggested this option be given to each potential member, regardless of where he lives or practices, although restricting that right to "... the local medical society in which they have a major interest."

In addition, the Bylaws Committee determined that no change should be made in the bylaws that adopts the AMA Principles of Medical Ethics as the Faculty's guidelines, inasmuch as the AMA is engaged in substantial revision of these principles. The Bylaws Committee also considered the question of Emeritus Members continuing to serve on committees and have all the rights and privileges of Active members, except the right to vote and hold office in local components. It determined no change should be made in this provision at this time.

A request from the Montgomery County Medical Society was also considered. This dealt with a reduced rate of dues for Associate members who are serving as house staff at hospitals. Inasmuch as the current bylaws permit House Officers to be either Associate or Active members of the Faculty, the Bylaws Committee felt it not necessary to recommend any change in the dues for such individuals. Associate membership carries with it a lower dues structure than Active members.

This concludes the report of the Bylaws Committee to the House.

JOHN G. BALL, JR., MD, Chairman, Montgomery County

EDWARD W. DITTO, III, MD, Washington County

CHARLES F. O'DONNELL, MD, Baltimore County

WILLIAM R. ROUT, MD, Baltimore City

BOARD OF MEDICAL EXAMINERS

Mr. President and Members of the House of Delegates:

The Board of Medical Examiners is composed of the following members whose terms expire on the dates indicated below:

J. Roy Guyther, MD, President 1979

Karl F. Mech, MD,
Vice President 1980

Arthur T. Keefe, Jr., MD,
Secretary 1982

John E. Adams, MD 1981

Aris T. Allen, MD 1980

DeWitt E. DeLawter, MD 1981

Chris Papadopoulos, MD 1979

Daniel I. Welliver, MD 1981

Following are performance statistics:

FLEX Examinations:

Applications received 1098

Examinations given (includes
three Day III only) 1041

Failed 471

Passed and Licensed 570

National Boards' endorsement 545

Reciprocity of other States' Licenses 287

Free Licenses 1

Total 1978 Licenses 1403

Certifications to other states 391

Duplicate licenses issued 12

Renewal of Registration 9337

Physicians' Assistants 1978

Registrations 92

Cardiac Rescue Technicians 1978

Registrations 147

Professional Associations 1978

Authorized 15

The statistics above reflect the ever-increasing workload of the Board of Medical Examiners. Undisclosed by the statistics is the new administrative load imposed by the CME requirements for re-registration which became effective in September, 1978. Approximately 30 physicians have not been able to reregister their licenses because of the CME requirements. Many more have been given limited waivers for CME requirements after individual consideration by the Board.

In November, 1978, the long-awaited Advertising regulations were completed and promulgated. At present, they are awaiting final approval from the Attorney General's office.

The regulations for Physicians' Assistants have been revised to clearly define degrees of supervision both in private offices and institutional settings. The regulations for Mental Health Counselors have been completed by the Board and submitted for promulgation.

The Board has completed Acupuncture regulations which are being reviewed by the Attorney General's office before promulgation.

"SURE, YOU CAN GET YOUR HUSBAND TO DIET. JUST HAVE HIM READ THE GROCERY AD PRICES BEFORE DINNER."

A great deal of time has been spent on preparing the regulations which will govern the practice of medicine by Nurse Anesthetists, Nurse Midwives and Nurse Practitioners. By statute, these regulations must be written jointly by the Board of Medical Examiners and the Board of Examiners of Nurses. Various specialty groups, including the appropriate Committees of the Medical and Chirurgical Faculty, have been included in these long drawn-out discussions. An agreement has been reached on the regulations for Nurse Anesthetists; however, the regulations for Nurse Practitioners and Nurse Midwives are still under discussion because of the serious differences of opinion between the two Boards on the degree of supervision which will be required. The Board of Medical Examiners, while recognizing the

expanding roles of many new groups of health professionals, strongly maintains that the actual medical activities of these individuals be supervised by the medical profession. Continuing disagreement on this issue has delayed the completion of these regulations.

Staffing problems have continued to plague the Board despite the acquisition of an administrative assistant, Mrs. Hilda Stevan, who is doing much to increase the efficiency of the office; however, budgetary restrictions, under-staffing and, more recently, severe problems with the mail room make the Board less efficient and responsive than it should be.

Legislatively, the Board appreciates the veto of HB-741 by Governor Harry Hughes. This bill called for the designation of medical specialists by the Board of Medical Examiners in conjunction with Med-Chi. While recognizing the public interest and need for such designation, the Board felt that the bill in its present form raised more problems than it solved and would be impossible to implement.

The Board is watching with interest HB-425 which calls for "Special Funding" for the Board. This bill would greatly improve the function of the Board by removing the present arbitrary budgetary restrictions imposed upon it. This bill is being studied in Summer Session by the Legislature.

Three of the members of the Board of Medical Examiners continue to serve on the overworked and underfunded Com-

mission on Medical Discipline.

In conclusion, the Board would like to again emphasize the importance we attach to close liaison with Med-Chi. Every effort will be made by the Board to maintain these lines of communication.

Respectfully submitted,

ARTHUR T. KEEFE, JR., MD,
Secretary

HEALTH MANPOWER

Mr. President and Members of the House of Delegates:

The Committee on Health Manpower was established to monitor the distribution of physicians in Maryland through the collection and analysis of all available data on physician manpower and public needs.

During this past year, this Committee has directed its activities toward two related areas of concern: the apparent maldistribution of physicians and the lack of an adequate and reliable data base on which to develop appropriate recommended actions to improve availability and accessibility of primary care physicians.

The Committee looked critically at the relationship between the availability of physicians and the socioeconomic characteristics of Maryland Counties and Health service areas. This analysis revealed a distinct relationship of physician distribution to the socioeconomic status of the patient population. Specific population

characteristics examined were availability third-party coverage, availability of specialized medical services and the social and cultural makeup of urban, suburban and rural areas of the state.

Numerous methods of improving the distribution of and accessibility to physician services were discussed, and a number of possible incentives were suggested to induce physicians to practice where they are needed. Among suggestions were:

1) Ways to improve third-party coverage for low-income families, particularly for primary care visits to physician offices in underserved areas;

2) Pursuing direct subsidies for new physicians agreeing to practice in underserved areas and also

3) Assuring that some students who enter medical school will return to practice in underserved areas and remain there after any period of obligatory service.

Regarding the need for manpower data, the Committee was directed by Council to consider a request from the Baltimore City Medical Society for financial support to conduct a study of primary care delivery by physicians in Baltimore. The study was proposed because of inadequacies in available data on the provision of primary medical care services in the private office setting. The Committee determined, after a review of all possible sources of such data, that this study would provide a more complete and more valid determination of health planning goals,

objectives and health plan implementation policies as they relate to the delivery of primary care. The final analysis of this data would be toward providing the medical and health planning communities with information as to how to improve existing primary care services, to develop additional analytical methodologies in physician manpower planning and to specify the present role of private practitioners involved in primary care delivery; however, because of the problems inherent in the study protocol as presented and the possibility of setting a precedent for similar requests from other component societies, the Council declined the Committee's recommendation that the Faculty participate by funding a portion of this study.

The Committee remains interested in the development of an improved manpower data base, and will be monitoring the progress of the Baltimore City Medical Society's efforts. Should the methodology being used to collect this data prove to be valid and reliable, the Committee may recommend that the Council consider replicating this study on a statewide basis at some future date.

In addition, the Committee offers its services to all component societies to assist in developing appropriate survey methodologies and analyzing manpower data made available through their efforts.

In addition to the activities mentioned above, the Faculty Health Planner assisted this Committee in responding to the health manpower segments of the draft Health Systems Plans for Maryland. Comments were forwarded to the local Health Systems Agencies addressing areas of concern to the physician community regarding the goals and objectives affecting health manpower and the delivery of health care services.

The Health Manpower Committee will continue to address these and other issues in the area of physician distribution and delivery of medical care. The Chairman wishes to take this opportunity to express his appreciation to each Committee member for services to the Faculty.

GENERAL MEETING MAY 3, 1979 HUNT VALLEY INN, HUNT VALLEY, MD

A General Meeting of the Faculty was called to order as indicated above by the President, Francis C. Mayle, Jr., MD, at 4 PM. About 28 persons were in attendance, plus various staff members.

A motion was made to abolish the General Meeting required by House of Delegates' action at both the Annual and Semiannual sessions, because of the lack of attendance of the membership.

After much discussion and several amendments were withdrawn after presentation, the motion was overwhelmingly defeated.

It was agreed, however, that more publicity should be given to this General Meeting, both through the *President's Letter* and the *Executive Director's Newsletter*, and through other mechanisms including the notices sent to component societies, delegates, alternates, etc.

There being no further business, the President declared the meeting adjourned at 4:30 PM.

PROGRAM AND ARRANGEMENTS

Mr. President and Members of the House of Delegates:

The Carousel in Ocean City was the 1979 Semiannual Meeting, a welcome return for our members who have enjoyed this location for many years. Total registration was 535, of which 387 were physicians. A varied scientific program was offered, and was well-attended despite the lure of the beautiful September weather. A limited number of technical exhibit spaces were sold to exhibitors who had products or services directly related to the scientific program. The social functions were well-attended. The MMPAC Luncheon was held within the week of the Gubernatorial Primary Election, and both the Democratic candidate, Mr. Hughes, and the Republican candidate, Mr. Beall, felt it propitious to accept an invitation to speak. All available luncheon tickets were sold, and there was standing room only around the perimeter of the luncheon area. The dinner/dance drew a sell-out crowd, and the traditional crab feast at Phillips Crab House,

PROGRAM COMMITTEE CHAIRMAN,
1980-81
 (Photo by Tadder, Balto.)

while drawing a small crowd, was an enjoyable afternoon.

The most varied scientific program ever offered, 39 different category I scientific sessions, made up the 1979 Annual Meeting at Marriott's Hunt Valley Inn. For the first time, the programming was extended to Friday afternoon, giving a full two-and-one-half days of scientific sessions. This enabled us to offer 18 hours of Category I Continuing Medical Education credit for the meeting. While there were few "standing room only" sessions, most were well-attended. Competition was keen for attendance in the six con-

ALVA S. BAKER, MD
Program Committee
 (Photo by Tadder, Balto.)

current sessions that were being held daily. *Recent Advances in Medicine and Their Application to Daily Practice*, the theme of the 1979 Annual Meeting, lent itself very well to the first plenary session to be held in recent years. The plenary session dealt with Prospective Medicine, a fairly-recent concept in medicine using health hazard appraisal. The Committee on Program and Arrangements feels the plenary session format is a good one, in that it gets most of the attendees together at one general session and gives a cohesiveness to the meeting. An innovation this year was the *Meet the Speaker* luncheon on Friday, which gave attendees an opportunity to meet on an informal basis with certain speakers from the Friday morning scientific sessions. This function was a sell-out, and was felt to be worth considering again in the future.

The MMPAC Luncheon, Prayer Breakfast and Lunch and Learn Session were well-attended, and the Health Evaluation Tests continue to be utilized by many Maryland physicians as their annual screening physical.

The Auxiliary sponsored a square dance on Thursday evening, and while the crowd was not large, those in attendance reportedly had a wonderful evening, full of fun.

The Presidential Banquet was held on Friday evening, and was a gala event enjoyed by all. The Head Table ceremonies were short and to the point, and there was lots of time for dancing and visiting with friends.

Total Annual Meeting attendance was 1,943, of which 1,092 were physicians.

Exhibit space at Hunt Valley Inn continues to be a problem, and the lack of space represents a loss of income to the Annual Meeting budget. At the time of the meeting, 37 technical exhibitors were on the waiting list, and could not be accommodated.

A move to the new Baltimore Convention Center, which is to be completed in the summer of 1979, will alleviate this problem. A serious problem in downtown Baltimore is the absence of suitable hotel rooms, and the Executive Committee has voted to not take the Annual Meeting to the Convention Center until the hotel rooms are available. This could possibly not come about until 1982.

Exhibit awards were given in both the scientific exhibit and technical exhibit classifications. There were many excellent exhibits, making it difficult for the Committee to select the three best in each category.

The Royal Sonesta Hotel, in New Orleans, LA is the site for the 1979 Semi-annual Meeting. Preparations are underway to obtain speakers from New Orleans for the scientific program. An interesting social program is being planned which includes Breakfast at Brennan's.

The 1980 Annual Meeting has been scheduled for Marriott's Hunt Valley Inn, and September, 1980 will find us in Williamsburg, VA for the Semiannual Meeting.

The Committee on Program and Arrangements very much appreciates all the help given to make this a successful meeting and wishes to thank the many individuals who gave so willingly of their time and effort. Among these are the Auxiliary, the Med-Chi staff, Dr. Richard Graham and all those volunteer physicians and technologists who worked to make the Health Evaluation Tests a success.

AD HOC COMMITTEE ON NEW FACULTY BUILDING

Mr. President and Members of the House of Delegates:

The renovation of the gym located to the rear of former School #49, which is to the south of our present building, is complete and the facility is almost 100% occupied by various groups. In accordance with instructions from the House of Delegates, the Committee is in the process of having an evaluation prepared of the land in Howard County owned by the Faculty. When this is received, this property will be placed for sale.

Dedication ceremonies took place on Feb. 6, 1979 with Baltimore Mayor William Donald Schaefer present. Since then, Baltimore Heritage has awarded the Faculty a certificate honoring it for its excellent job of restoration.

It is hoped by the Annual Meeting of 1980, progress will be underway in connection with renovations of former School #49.

QUIBRON[®]

Each capsule or tablespoonful (15 ml) liquid
contains theophylline (anhydrous) 150 mg
and glyceryl guaiacolate (guaifenesin)
90 mg

- theophylline for effective
around-the-clock
bronchodilator therapy
- 100% free theophylline

Indications: For the symptomatic relief of bronchospastic conditions such as bronchial asthma, chronic bronchitis, and pulmonary emphysema.

Warnings: Do not administer more frequently than every 6 hours, or within 12 hours after rectal dose of any preparation containing theophylline or aminophylline. Do not give other compounds containing xanthine derivatives concurrently.

Precautions: Use with caution in patients with cardiac disease, hepatic or renal impairment. Concurrent administration with certain antibiotics, i.e., clindamycin, erythromycin, troleandomycin, may result in higher serum levels of theophylline. Plasma prothrombin and factor V may increase, but any clinical effect is likely to be small. Metabolites of guaifenesin may contribute to increased urinary 5-hydroxyindoleacetic acid readings, when determined with nitrosonaphthol reagent. Safe use in pregnancy has not been established. Use in case of pregnancy only when clearly needed.

Adverse Reactions: Theophylline may exert some stimulating effect on the central nervous system. Its administration may cause local irritation of the gastric mucosa, with possible gastric discomfort, nausea, and vomiting. The frequency of adverse reactions is related to the serum theophylline level and is not usually a problem at serum theophylline levels below 20 mcg/ml.

How Supplied: Capsules in bottles of 100 and 1000 and unit-dose packs of 100. Liquid in bottles of 1 pint and 1 gallon.

See package insert for complete prescribing information.

MARYLAND STATE MEDICAL JOURNAL

*Mr. President and Members of the House
of Delegates:*

This report covers the period August, 1978-August, 1979, a period marked by continued growth in the stature of the *Journal*. In April, 1979, the *Journal* received an Honorable Mention in the Sandoz Pharmaceutical Medical Journalism Competition. The award was for excellence in design and editorial content. The Managing Editor deserves the credit for this award.

The *Journal's* 1978-79 monthly mailing schedule was maintained on time, and there were no operational problems with our printing firm, Boyertown Publishing Co. of Boyertown, PA, with which we continue to enjoy an excellent working relationship.

Local advertising remains excellent as a result of the continuing highly-effective ad sales campaign presented by the Shirley Arnowitz Advertising Agency. In addition, the *Journal* continues to receive a good share of the national advertising market in the State Medical Journal Bureau.

The combination of increased advertising revenue, plus a concerted effort on the part of the staff to decrease the costs of production, resulted in a savings to the *Faculty* of almost \$20,000. The savings occurred without a concomitant decrease in the quality of the *Journal*.

The *Journal* continues to receive an increasing number of scientific and other scholarly manuscripts on topics of practical value to practicing physicians throughout the state. Plans for the future include more feature articles dealing with the activities of Maryland physicians. Active solicitation of manuscripts of interest to practitioners in diverse specialties in all areas of the state will continue.

The Editorial Board is more active than ever and the full Board meets quarterly. During the year, Chinmoy Banerjee, MD joined the Board for a three-year term. The Editor and Associate Editor appreciate the interest and dedication of the Editorial Board in working toward an even better product.

As always, all comments regarding all facets of the *Journal* are thoroughly considered and are always welcome. The basis for any editorial decision will always be gladly shared with any member of Med-Chi.

Respectfully submitted,

JIM ZIMMERLY, MD, JD, MPH,
Editor

COUNCIL

A total of nine Executive Committee and seven Council sessions were held during the past year. As has been the custom for some time, these meetings are summarized in the *Maryland State Medical Journal*. In addition, copies of the Minutes are mailed to all Component Societies, as well as Council members. It is hoped through this method all members are aware of the activities that guide the affairs of the Faculty.

Some of the major items of business discussed and on which action was taken are as follows:

1. Instituted legal action against the Health Services Cost Review Commission in connection with proposed regulations controlling physicians' fees. The regulations were withdrawn by the HSCRC.

2. Authorized publication of advertisements in selected weekly newspapers in Maryland, these ads being copies of those published on a national basis by the AMA. The Faculty's name was utilized in the advertisements.

3. Adopted a policy with respect to second opinions, which has been published and made available to all members.

4. Adopted a position that the Faculty Members' health insurance program should include broader benefits for psychiatric care, as well as for alcoholism treatment.

5. Suggested names to the Governor's office in connection with possible appointment to the Health Services Cost Review Commission. Roland T. Smoot, MD, of Baltimore, was named to one of the vacancies in this group.

6. Adopted a position in connection with proposed regulations dealing with Nurse/Midwives Nurse/Anesthetists and Nurse/Practitioners, and extended legal action, if necessary, to resolve the dif-

ferences in the Faculty position and that of the Nursing groups.

7. Discussed at some length whether or not legal action should be taken in connection with funding of the Board of Medical Examiners activities and the Commission on Medical Discipline activities. Pending possible legislative action, withheld taking any action in this connection.

8. Learned of and approved participation in an Inter-Agency Task Force which is looking into the potential of reviewing in-hospital patient care to ensure quality medicine is provided and to afford a mechanism to interested governmental agencies for review of questioned matters in this area.

9. Learned that the Federal Election Commission had issued a subpoena for certain Faculty records in connection with MMPAC activities. Nothing further has been heard in this regard.

10. Approved addition of a full-time employee to become involved in health planning activities and to coordinate and keep local societies apprised of local HSA determinations and decisions; as well as state activities in this area.

11. Authorized a wage and salary study to be conducted by an outside consultant.

12. Approved investigation of a retirement and pre-retirement program for members through the Physician Rehabilitation Committee.

13. Approved inviting the AMA to hold its Fourth National Impaired Physician Conference in 1980 in Baltimore.

14. Approved cooperation in promotion of TelMed, a telephone answering service that plays for inquirers information on specific diseases or conditions.

15. Approved cooperation with the Auxiliary in connection with a potential plan for Family Relations.

16. Approved a proposed fundraising program for library endowments.

These highlights, while summarised in a brief manner, did receive considerable thought and study by committees and Council members prior to their adoption. An expression of appreciation is given to all Council members who attended faithfully the Council sessions and participated fully in its activities. It was a pleasure to serve as Council Chairman and I hereby express my appreciation to the entire membership for permitting me to serve in this capacity.

VINCENT J. FIOCCO, MD,
Chairman □

MEDICINE AND RELIGION

Mr. President and Members of the House of Delegates:

According to its Bylaws, the Medicine and Religion Committee shall concern itself with maintaining effective liaison and lines of communication between physicians and clergymen in order to provide the most effective care and treatment to the patient and his family. Throughout the year, the Committee has directed its efforts toward fulfilling this responsibility.

Action of the Committee for the past year is as follows:

1. Discussion took place with respect to the establishment of voluntary Life Preservation Advisory Groups in hospitals throughout Maryland. It is the belief of this Committee that such groups provide an invaluable service to those individuals who are daily faced with the dilemma of making life and death decisions. This is actively being pursued at present.

2. Reverend Clyde Shallenberger, Director of Chaplaincy Services for Johns Hopkins Hospital, delivered the formal presentation during the Prayer Breakfast which took place during the Annual Meeting. His presentation proved to be thoroughly enjoyable and contributed greatly to the overall success of the meeting.

The Committee also sponsored one of the Lunch and Learn Sessions. Dr. Jack M. Zimmerman and Father Paul S. Dawson, both of whom are associated with Church Hospital, were invited to moderate a session on their highly-successful research activities on hospices.

3. It was noted that many of the colleges, medical schools and seminaries may not be aware of the existence of the Committee. It was agreed to send a letter to these organizations informing them that the Committee is available and most

willing to offer assistance and guidance in areas of mutual concern.

4. Several Committee members remain deeply concerned over the increasing number of physicians refusing to treat medical assistance patients. The "ACCESS" program currently being conducted by the Allegany County Medical Society has been rather successful in this area. The Committee felt this program should be given further study, and, quite possibly, used as a model program for the entire state. Following further discussion, this may be referred to the Liaison Committee for consideration by that group.

The Chairman would like to thank all members of the Committee for their invaluable assistance and support throughout the year.

REV. CLYDE SHALLENBERGER □

SECRETARY

Mr. President and Members of the House of Delegates:

It is the responsibility of the Secretary to ensure that Faculty is operating in an efficient manner, that Committees are properly staffed, that policies established

by the Faculty are communicated, that records, letters and all other activity emanating from the Faculty office are current and are handled in a prompt and efficacious manner. It is my pleasure to report that this occurs.

Meeting notices are mailed well in advance of meetings and, again, are handled in an effective manner. All meetings are attended by a staff person. Minutes of all meetings are promptly written so they can be reviewed by Committee Chairmen and distributed to Committee members.

In addition to outgoing mail, several hundred pieces of mail arrive each day in the Faculty office and are routed to the appropriate staff persons for disposition. Many responses are mailed each day and the volume of this mail continues to increase. Also, the office of the Secretary corresponds with component medical societies, communicating the Faculty business in both directions, to and from the components.

Of interest is the continued increase of membership in component medical societies and the Faculty. At the beginning of the 1979-80 Faculty year, we have a total of 5,556 members, broken down into 4,764 Active and 40-Year, 189 Emeritus, 176 Associate and 421 Affiliate.

It is a secure feeling to know the Faculty staff is courteous, efficient and effective in carrying out assigned responsibilities. The enthusiasm of the staff is appreciated and their devotion to duty is duly noted. The well-deserved thanks of all officers and members go to these faithful employees who perform their work without concern for time, effort or their own personal needs.

BERNARD S. KARPERS, MD,
Secretary □

HOME HEALTH CARE

Mr. President and Members of the House of Delegates:

The Ad Hoc Committee on Home Health Care held one meeting this year to review Medicare directives relative to Vitamin B12 administration, and to review a draft proposal regarding Home Health Care for inclusion into the Annual Plan developed by the Maryland Health Planning and Development Agency. The Ad Hoc Committee is confident that its attention into these matters has resulted in policies assuring quality for home health care patients.

The Chairman wishes to express his appreciation to the members of the Committee for devoting their attention to these issues as they arise.

Respectfully submitted,

J. D. DRINKARD, MD

POLICY AND PLANNING

Mr. President and Members of the House of Delegates:

Throughout the past year, the Policy and Planning Committee has held regular meetings to consider ways in which to improve services by the Faculty to component societies and to consider long-range policies and goals of the Faculty.

Several items were discussed during the past year. As a result of data obtained to carry out a national survey of State Medical Societies and Blue Shield Plans, a Resolution was introduced calling for Blue Shield of Maryland to 1) Abolish the profile system of determining physician payment; 2) abolish the "service" concept under Blue Shield policies and; 3) adopt a policy of accepting assignment of payments to physicians in the same manner as do commercial health insurers. The Council did not adopt the resolution, but this issue will remain a continuing agenda item for consideration by the Committee.

In another area of activity, the Committee developed a proposal to establish a periodic or graduated dues increase which would accomplish the objective of a balanced budget, meet the needs of the membership, as well as establishing a set sum of contingencies and reserves which would be built up to at least one year's estimated operating budget. The proposed system takes into consideration our inflationary economy and provides for fair and thorough input into the budget by all Delegates, Alternate Delegates and Component Society Officers. This is to be considered at a future meeting of the Council.

The Committee is also considering a proposal for the development of a credit union for the benefit of Faculty members. A Subcommittee has recommended this concept. The membership will be surveyed through the annual 20% survey in the near future. The Committee has also endorsed a Membership Recruitment Proposal designed to approach prospective members through personal physician contact.

The Committee also considered a proposal from the Baltimore City Medical Society to revise Faculty Bylaws to allow physicians to join the local society in which they have their major practice.

Existing Bylaws require membership based on either where the physician maintains his principal office or that component area wherein he lives. Based on changing practice locations, and on possible effects on existing peer review mechanisms, the Committee recommended that the bylaws be changed so that after initial appointment and membership acceptance, a physician may elect to retain his membership in the component society through which is elected, even though he may move his practice and home outside of that component's area.

Judging from the many socioeconomic issues facing organized medicine, there appears to be a great need for this Committee. Component Societies are urged to ensure the presence of their representatives so that we may adequately answer this need. The Committee is confident that the actions taken this past year have that the actions taken this past year have to equally-productive meetings in the year ahead.

Doctors Take Note:

The Second Annual Ophthalmology Conference For The Non-Ophthalmologist Physician: The Eye and Systemic Diseases, will be held on Saturday, Oct. 13, 1979, in the Cafetorium of The Fairfax Hospital, 3300 Gallows Rd., Falls Church, VA 22046, (703) 698-3785. This program is approved for six credit hours in Category I by the AMA and is acceptable for six Prescribed hours by the AAFP.

HEARING AND VISION EARLY SCREENING (HAVES)

Mr. President and Members of the House of Delegates:

Screening to identify three-year-old children for vision and/or hearing problems was conducted in 80 preschools and/or 28 community sessions located in Baltimore City, Anne Arundel, Baltimore, Calvert, Carroll, Cecil, Charles, Frederick, Harford, Howard, Talbot and Washington Counties during the past year.

Public service announcements of the programs by the press, radio, TV, posters and fliers indicated the joint sponsorship of the Medical and Chirurgical Faculty, the Maryland Society for the Prevention of Blindness and the local service clubs.

Reports to parents of the 4,114 children who were tested advised them to consult their children's physician or usual source of medical care regarding the screening performance.

Orientation, health education and training sessions were held, as needed, for the service organizations who conduct the program under the supervision of the Maryland Society for the Prevention of Blindness.

The Community screening sessions held by a new group, the Bayside Jaycettes, in the Calvert County Hospital, have been enthusiastically received.

The Ladies Auxiliary to the Four County Medical Society deserves special recognition for its effort over the past six years. They annually check approximately 267 children enrolled in eight Talbot County preschools and Head Start centers.

Rotating schedule. Send resume to Mr. Stuart R. Herrold, Vice President, Frederick Memorial Hospital, W. Seventh Street, Frederick, Maryland 21701.

LIBRARY AND HISTORY FINNEY FUND

Mr. President and Members of the House of Delegates:

The past year can be characterized as a period of rapid growth in the use of the Library's services by members of the Medical and Chirurgical Faculty. This growth is reflected both in an increase in the number of member physicians who actively use the Faculty Library and in an increase in the volume of services provided to them.

The number of Faculty members who made use of the Library's services at least once during the 1978-79 year increased 38.4% over the 1977-78 year. In terms of specific Library services, the number who used the computerized bibliographic services (especially MEDLINE) increased 54.9%, those who requested photocopies increased 21.9% and the number of members for whom the Library borrowed materials from the National Library of Medicine, medical school libraries and other sources increased 39.3%.

The Library is used by members of every one of the Faculty's component societies. The fact that its services are available through the mail and by telephone assures that physicians in the remote and rural sections of Maryland have the same access to biomedical information services as the physicians located close to large metropolitan medical libraries. The following chart compares the geographic distribution of Faculty members who used the Library's services in 1978-79 with the geographical distribution of the Faculty's total membership for the same period:

Geographic Area	% of Library Services Received by Med-Chi Members in the area	% of Total Med-Chi members in the area
Baltimore City	38.8%	32.9%
The Five Counties in the Baltimore Metropolitan Area	31.7%	24.1%
Prince George's and Montgomery Counties	12.7%	28.3%
Southern Counties on Western Shore	2.3%	1.7%
Western Maryland Counties	7.6%	6.8%
Eastern Shore Counties	6.9%	6.2%

Computerized bibliographies, photocopied journal articles and interlibrary loans represent the three major library services available to Faculty members. Use of all these services by the membership increased substantially during the 1978-79 year. The number of bibliographies provided increased 27.2% over 1977-78; the number of photocopied journal articles provided increased 38.7% and the number of items borrowed from other libraries increased 104.9%.

The following table illustrates this

growth in the volume of the Library's major services over the past year, and it also shows the figures for telephone reference calls, books circulated to Faculty members and items loaned to other libraries:

Library Services	1977-78	1978-79
Computerized bibliographies (MEDLINE, etc.)	1,205	1,533
Photocopied journal articles	4,158	5,768
Items borrowed from other libraries	1,131	2,317
Books circulated to Faculty members	580	576
Items loaned to other libraries	2,328	983
Telephone reference questions	8,230	9,072

The fact that the number of books circulated to Faculty members has remained constant, while the number of journal articles provided, and the number of items obtained from other libraries (usually journal articles) have increased, is significant. Circulation of books used to be the Library's major function. The advent of computerized bibliographic searching has increased Faculty members' awareness of current information in periodical literature, and it is now demanded much more than the dated information found in monographs. This trend will influence the Committees and the Librarian in the allocation of the Library's endowed income in the coming year.

The decrease in the number of materials loaned to other libraries is largely the result of improved hospital libraries throughout Maryland and an increased

several factors, most of which were itemized in the 1977-78 annual report as means to increase awareness among Med-Chi members of the Library benefits that accompany their memberships. During the past year, the Librarian attended and

spoke at seven component society meetings. In addition, a member of the Library staff attended each meeting of the Baltimore City Medical Society with an exhibit of current books and a bibliographic handout related to the topic of the meeting. The Library Committee's Chairman addressed the annual meeting of the officers of the component and specialty societies.

A new brochure describing the Library and its services was directed toward the general membership. A copy was mailed to every existing member, and one will be sent to each new member and each newly-licensed physician in the state.

As much as one-fourth of the Library's services to Faculty members are distributed through hospital libraries, since many physicians find it convenient to have their hospital librarians request materials and bibliographies for them. The development of strong core libraries in hospitals results in better library services to Faculty members. The important items that are likely to be urgently-needed are close at hand, allowing the Faculty Library to concentrate its collection on materials that hospital libraries would not be expected to own. During the past year, the Librarian conducted a basic course on *The Organization, Management*

and Services of a Small Hospital Library in Havre de Grace and Easton, and a course on *Basic Reference Tools and Techniques* in Easton, Cumberland, Baltimore and Frederick. In addition, he made consultation visits to eight hospitals throughout the state. In most cases, the purpose of such a visit is to establish a program that will bring the hospital's library up to the standards required for JCAH accreditation. This leads to improved library services available to Faculty members in the area and increased use of the Faculty Library.

The following table reflects the growth of the Library's resources during the 1978-79 year:

Library Resources		
	1977-78	1978-79
Books added	841	840
Journals bound	713	317
Total volumes added		1,157
Previous total volumes		103,909
Current total volumes		105,066

The drop in the number of volumes bound is due to a lull in binding of almost one year that occurred in 1976-77. The effort to catch up in 1977-78 resulted in a distorted figure for that year.

Current estimates show the cost of medical books increasing at 9% per year, and medical periodical costs are rising at about the same rate. This figure exceeds the annual increases in income to the endowed funds that support the Library's book and journal purchases.

During the coming year, the Library Committee and the Finney Fund Committee will take a very careful look at the Library's book selection policy and journal subscriptions. It is likely that purchases of monographs will be limited to those items required to support the reference services and to those recommended or requested by Faculty members. The current periodical subscriptions will be compared with a list of the titles most frequently requested and a list of the titles that must frequently be borrowed from other libraries. As a result, unused titles will be dropped and others that are in demand by members will be added.

In addition, the Library Committee has begun efforts to increase endowment support for the library. Two leaflets are ready for publication and distribution. The first, about the William Osler Associates, encourages members and the component and specialty societies to endow individual periodical subscriptions. The second leaflet, *Your Will Can Help*, informs members how to include the Faculty Library in their wills.

The Carroll Fund, initiated in 1978 to honor the late Douglas G. Carroll, Jr., MD, a former Chairman of the Library Committee, raised a principal of \$13,000. The income to this fund will be used to

purchase materials related to Maryland's medical history and to pulmonary medicine, which were Dr. Carroll's chief interests.

The Librarian, Assistant Librarian and the Cataloging and Acquisitions Specialist represented the Faculty Library at the Medical Library Association's annual meeting in Chicago in June; all attended continuing education courses. The Librarian spoke to new library school graduates on job prospects in medical society libraries. In addition, he was elected Chairman of the Medical Society Libraries Special Interest Group of the Medical Library Association, and he serves on the Association's Bibliographic and

was elected to a two-year term on the Regional Advisory Council. During the last year, the Librarian completed a five-year term as Chairman of the Region's Online Services Committee, and he is now a member of the Region's Education Committee.

Library Staff, as of April, 1979:	
Joseph E. Jensen, Librarian	
Adam Szczepaniak, Jr., Assistant Librarian	
Patricia Munoz, Cataloging and Acquisitions Specialist	
Frances Yatsevitch, Reference and Circulation Librarian	
Eleanor Mason, Secretary to the Librarian	
Patricia Poleski, Reference and Circulation Assistant	
Ronald Rothermel, Serials Assistant	

A primary goal for the coming year is the previously-mentioned assessment of the Library's collection policies, in view of the information needs of the Faculty's membership. Coupled with this will be the drives to increase the Library's endowed income to meet both rising costs and the increased demand for services by the membership. Additional goals include a thorough weeding of outdated and unimportant materials from the collection to allow room for growth, persistent efforts to increase awareness of the Library and its benefits among Faculty members, continuing attempts to upgrade hospital libraries and the preparation of an appropriate celebration and memorial for the 150th anniversary of the Faculty Library in June, 1980.

Respectfully submitted,

AUXILIARY

Mr. President and Members of the House of Delegates:

Dr. Mayle, Dr. Pillsbury, Dr. Fiocco and members of the House of Delegates. I thank you for opportunity to appear before you and give the annual report of our State Auxiliary. It is vibrant, successful and growing.

Last July, in St. Louis at the National Convention of the AMA Auxiliary, our President, Mrs. Chester L. Young of Kansas, gave this quote in her farewell speech: "He has achieved success who has lived well, laughed often and loved much; who has gained the respect of intelligent men and the love of small children." She ended there, but I would continue with the next line, that is: "Who has filled his niche and accomplished his task, who left the world better than he found it."

This quote describes the members of the Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland. Our membership numbers almost 950 State and over 81,000 National members. All of our members are volunteers, an almost extinct group of people. We volunteer our time to promote an honorable profession, medicine, and we gladly volunteer many hours of service to Community Health Projects.

This year, our component Auxiliaries sponsored, taught or manned CPR classes, Blood Pressure Clinics, Hearing and Vision Screening, aided the State Immunization Program by providing posters, hop-sotch stencils, a film entitled, *Don't Let the Bug Bite You*, a one-minute spot announcement for TV and one county taped a radio appeal on Immunization. Other components sat as advisors local School Boards, pushed for Health Educa-

tion Programs in schools and sent drugs, medical journals and surgical supplies to Appalachia, South America and India. We have worked with other organizations, such as the PTAs and the Maryland Teachers Associations and have sent a representative to the National Safety Council's Regional Meeting. It's been a busy year, we had fun along the way and we made friends.

I want to thank Dr. Mayle for the consideration, courtesy and support he provided during the entire year. To members of the Council, thank you for inviting the President of the Auxiliary to attend your meetings. It is through these encounters that your Auxiliary learns of medicines' concerns and involvement with the community.

To members of the Program and Arrangements, Public Relations and Legislative Committees, Mr. Sargeant and the you for your unfailing assistance and Med-Chi staff, I personally want to thank sharing of your expertise.

It was a privilege to pay tribute to

FINANCE

Mr. President and Members of the House of Delegates:

The year 1978 was marked by volatility, both in the economy and the stock market. For the year as a whole, real growth in the economy was about 4% and prices rose approximately 7.5%. The growth was achieved in spurts with disappointing numbers in the first and third quarters, and ebullient expansion in the second and fourth. Inflation was high throughout the year, except for a brief summer respite.

Stock prices were similarly erratic. A decline in the first quarter was followed by a strong rally which lasted until October, when many of the gains were lost. The year finished on a positive note, and the growth stocks did better than the market averages. Unfortunately, rising interest rates caused most bonds to decline in value, and this trend is likely to continue in 1979.

T. Rowe Price anticipates a slowdown

MRS. THOMAS HERBERT, OUTGOING AUXILIARY PRESIDENT, addresses the House of Delegates at Hunt Valley Inn, Annual Meeting, May, 1979.

in 1979 and possibly a recession. It is hoped that the downturn will be mild and not a repeat of the severe recession of 1974. Because of the high degree of uncertainty in the economy, our advisors are rather tentative about investment strategy.

ROBERT B. GOLDSTEIN, MD
Faculty Treasurer

Our Chairman, Dr. "Mac" Boyer, died in 1978. This Committee will miss his valued counsel and sincere friendship. He served his fellow physicians in many ways.

ROBERT B. GOLDSTEIN, MD
THEODORE OSIUS, MD
ARTHUR T. KEEFE, MD
E. W. DITTO, JR., MD

□

TREASURER

Mr. President and Members of the House of Delegates:

The financial books and records of the Medical and Chirurgical Faculty have been audited for the year 1978. The audited financial reports reflecting the results of the operations of the year, and

the financial position of the Faculty at year-end 1978 are part of the report. The auditors have submitted an unqualified opinion that our financial statements are accurate and conform to generally-accepted accounting principles. The Faculty's financial position remains sound after the year of operating within the established budget.

The budget for 1979 was approved by the Council. It reflects a deficit of income to expenditures, which will be funded by accumulated reserves. The Faculty will need to begin planning for a change in dues structure.

The report of the Finance Committee will include a review of the Faculty investment portfolio.

ROBERT B. GOLDSTEIN, MD,
Treasurer □

The Medical and Chirurgical Faculty
of The State of Maryland
Baltimore, Maryland

We have examined the balance sheet of The Medical and Chirurgical Faculty of The State of Maryland as of December 31, 1978 and December 31, 1977 and the related statements of income, expenditures and transfers and changes in fund balances for the years then ended. Our examination was made in accordance with generally accepted auditing standards and, accordingly, included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the financial statements referred to above present fairly the financial position of The Medical and Chirurgical Faculty of The State of Maryland as of December 31, 1978 and December 31, 1977 and the income, expenditures and transfers and changes in fund balances for the years then ended, in conformity with generally accepted accounting principles applied on a consistent basis.

1979 BUDGET NOTES

A. CONTRIBUTIONS:

Reflects a reserve for possible requests during the year.
Budgeted items include:

American Student Medical Association	
University of Maryland Chapter	\$300.00
Johns Hopkins Chapter	300.00
Miscellaneous	400.00
	<u>\$1,000.00</u>

B. TRAVEL:

Includes attendance at following meetings:

Professional Convention Management Association, Jan. 6-14, San Francisco, Calif., (one staff member).

Regional Legislative Conference, Ft. Lauderdale, Florida, Jan. 4-6, one staff member.

National Medical Leadership Conference, Chicago, President, President-elect, Council Chairman, two staff members, Feb. 15-18.

Chief Executive Officers State Medical Association, Hilton Head, South Carolina, March 11-13.

Attendance at Regional AAMSE Seminars, 4-5 staff members, location not known.

Regional AMA Meeting, three Delegates, three alternate Delegates, President, President-elect, C.E.O. Wash., DC, Apr. 24-25.

AMA Annual Session, Chicago, July 22-26, three Delegates, three alternate Delegates, President, President-Elect, two staff members.

Medical Society Executive Conference, in conjunction with above, three staff members.

AMA Interim Session, Hawaii, Dec. 2-5, three Delegates, three alternate Delegates, President, President-Elect, two staff members.

Medical Society Executive Conference, in conjunction with above, two staff members.

American Society of Association Executives, Annual Meeting or similar education activity, St. Louis, MO, Aug. 4-8, two staff members.

Executive Conference, ASAE, date and place to be announced, one staff member.

Travel throughout the state for various component society meetings, other business and activities, as well as out of state Regional and National Sessions as determined on an individual basis.

C. PRINTING:

Includes the publication cost of the membership directory.

D. GOVERNMENTAL RELATIONS:

Includes nurses' salaries and supplies for First Aid Room, telephone hot line, publications printing and mailing costs and travel.

E. LIBRARY:

ELECTION OF THE BOARD OF MEDICAL EXAMINERS GENERAL MEETING MAY 3, 1979

A general meeting of the Medical and Chirurgical Faculty of the State of Maryland was held on May 3, 1979, at Noon for the purpose of electing members of the Board of Medical Examiners. The session was held at the Hunt Valley Inn, Hunt Valley, MD.

Francis C. Mayle, Jr., MD, President, presided and called the meeting to order at 12:02 PM.

The names of the following nominees were presented to the general meeting as follows, both for a four-year term, commencing in June, 1979:

Manning W. Alden, MD, Annapolis, MD
Chris Papadopoulos, MD, Baltimore, MD

Nominations from the floor were requested. There being none, the President declared nominations to be closed and the Secretary was instructed to cast one ballot for those nominated. They were declared elected at 12:05 PM, and the general session called for this purpose was adjourned at the same time.

BERNARD S. KARPERS, MD
Secretary ☐

**MARYLAND FOUNDATION
FOR HEALTH CARE**

*Mr. President and Members of the House
of Delegates:*

During the past year, the Foundation has completed its study on malpractice incidence in Maryland, which was carried out under a grant from the US Department of HEW. In addition, the Foundation acts as Fiscal Agent for the Renal Dialysis program, Network #31, which currently rents space from the Faculty in its renovated facility facing on Maryland Avenue and to the rear of the present Faculty building at 1211 Cathedral St. in Baltimore.

The Foundation is also continuing to carry out its responsibility under subcontract from the AMA for improving medical care in local jails. This contract has been renewed through mid-1980. The Director also acts as a consultant to other similar programs under the auspices of State Medical Associations throughout this area of the country. Visits are made to train personnel in this type of activity, to assist in inspection of jails, and to generally advise on the operation of their programs.

Recognizing a need for a 501 (c) (3) corporation funds given to which can be taken as a tax-deduction by the contributor, the Foundation established the Maryland Institute for Public Health Research. Two meetings of the Board of this group have been held and exploration of potential projects is taking place. Currently, consideration is being given to a physician reeducation project which could be used to evaluate the present medical school curriculum as well as the value of continuing medical education courses.

The feasibility of other studies is also under consideration. The Institute will also become the sponsoring organization for Tel-Med, the concept of which has been approved by the Faculty Council. Current members of the Board of the Institute are: Edward J. Kowalewski, MD; Alvin D. Ankrum, B. Robert Fellerman, Irving J. Kessler, MD; Albert J. McGann, Edyth H. Schoenrich, MD; John W. Shaffer, PhD and George Tyler, Esq.

MARYLAND MEDICAL POLITICAL ACTION COMMITTEE

Mr. President and Members of the House of Delegates:

PAC was again very successful in its support of candidates in the 1978 elections. Five congressional candidates were supported in the Primary and General Elections, and our only loss was in the 8th Congressional District.

The luncheon meeting in Ocean City was very well-attended by members and the news media. The speakers were both candidates for Governor, only three days after the Primary Elections. MMPAC

was fortunate to be able to provide the forum for the first public meeting of the candidates.

Freshman Congressman Daniel B. Crane spoke at the MMPAC luncheon meeting on May 2, 1979. His address was entitled *From Womb to Tomb*. Maryland received its second AMPAC Leadership Recognition Award in June, 1978 in St. Louis. The award was accepted by the Vice Chairman, Mrs. Helen Boyer. We hope to again receive that award this year.

The membership for 1979 is already well above 1978. The increase of 653 brings the total membership to 2,523. The sustaining membership is also higher, but not near as much as it should be.

Again this year, we plan to have a PAC

seminar for the members who wish to become more active in politics and civic activities. It will probably be held in October, 1979 so as not to conflict with vacations, graduations and medical meetings.

We in the PAC solicit the help of each and every member of the House of Delegates and also Med-Chi to increase our membership, particularly the sustaining ones. The next two years before the 1980 elections will be filled with controversial issues, and we need to identify candidates who are more prone to listen to the problems of medicine.

Respectfully submitted,

RICHARD F. MOSCHELL, MD
Chairman □

Doctors in the News

Hopkins Urologist Receives Top Urology Award

William W. Scott, MD, Professor Emeritus of Urology at the Johns Hopkins School of Medicine, has been awarded the 1979 Keyes Medal, which is given periodically for outstanding contributions to the advancement of urology. The award is given by the American Association of Genito-Urinary Surgeons, founded by Edward L. Keyes, a prominent genito-urinary surgeon.

As Chairman of the Department of Urology at Hopkins from 1946-74, Dr. Scott established a basic

research program that developed an international reputation for such discoveries as how certain steroids inhibit androgen and how certain hormones make androgens more potent. Androgens are hormones involved in the development of male sex organs.

Dr. Scott, who also has a PhD in physiology, is well-known for his own research on the prostate gland and prostatic cancer. He introduced the use of anti-androgen for treatment of prostatic cancer and benign prostatic enlargement. Use of anti-androgen is being explored in experiments at several institutions around the country because it

apparently has fewer side-effects than the estrogen compounds now being used on patients.

In related work, Dr. Scott is examining patient histories to evaluate the effectiveness of chemotherapy on prostatic cancer and to see if it can be determined in advance which patients would respond to hormonal therapy. Evidence so far strongly suggests that such therapy is effective for men who have androgen receptors in the prostate.

Dr. Scott's interest in research led to his founding **Investigative Urology**, a prominent journal devoted to basic research. He has been Chairman of the National Prostatic Cancer Project's Subcommittee on Treatment and has won numerous awards, including the American Medical Association's Gold Medal.

NOTES TO FINANCIAL STATEMENTS DEC 31, 1978

Note 1—Summary of Significant Accounting Policies

The Medical and Chirurgical Faculty of The State of Maryland is a nonprofit organization, tax exempt under Section 501 of the Internal Revenue Code.

Marketable securities are carried at cost. Market values at Dec. 31, 1978 and 1977 were \$1,005,281 and \$921,888, respectively.

The Faculty carries its investment in the 100% owned Med-Chi Insurance and Services Corporation at cost. Income in the form of dividends will be recorded when received. The net assets of the corporation as of December 31, 1978 were as follow:

Current assets	140,982
Fixed assets—net	11,841
	<u>152,823</u>
Current liabilities	32,225
	<u>120,598</u>

Fixed assets, other than personal property, are recorded at cost. Portraits were appraised as of December 31, 1963 at \$65,000, an increase of \$51,000 over prior years. All other personal property was appraised as of Dec. 31, 1949. Depreciation on fixed assets is not provided. Current acquisitions are expensed. A schedule of fixed assets follows:

Real Estate	1978	1977
Unimproved land—Howard County	204,107	204,107
Land—1215-1217 Cathedral Street	19,119	19,119
1209-1215 Cathedral Street		
Land and building	110,636	110,636
Improvements	331,525	331,525
1205-1207 Cathedral Street and 1204 Maryland Avenue		
Land and buildings	25,361	—
Improvements	133,060	3,935
	<u>823,808</u>	<u>669,322</u>
Other	1978	1977
Library books, journals	231,370	231,370
Office and library—fixtures, antiques and museum pieces	77,350	77,350
Portraits—appraised value	65,000	65,000
	<u>373,720</u>	<u>373,720</u>
	<u>1,197,528</u>	<u>1,043,042</u>

Note 2—Pension Plan

The Faculty has a noncontributory pension plan covering substantially all its employees. Pension contributions for the current year and prior year were \$48,722 and \$37,325, respectively, which includes amortization of prior service cost over 20 years. The Faculty's policy is to fund pension costs accrued. At April 1, 1978, the pension fund's most recent valuation date, the fund's net assets exceeded the actuarially computed value of vested benefits by \$24,495. □

Loyola College Fall R_xMBA Program Accepting Applications

Applications are now being accepted for the fall 1979 class of Loyola College's executive program in health care management (R_xMBA) in Baltimore. The graduate program, which began in fall of 1978, is geared to top executives in health care and related fields.

Similar to Loyola's executive master in business program, R_xMBA is a two-year master's degree program drawing students principally from the Baltimore, Columbia and Washington, DC areas. Classes convene on alternate Fridays and Saturdays throughout the academic year at Loyola's Columbia Center.

Currently, 30 men and women are enrolled in the first R_xMBA class which will complete the program in spring of 1980.

To satisfy practitioners and prospective employers

Your solution to professional office space

Westminster Professional Center could very well be your answer!

Picture your situation: limited space; no parking; and high overhead.

Consider your alternative: a large modern professional office building geared to the medical profession with functional office interiors to fit your needs; ample on-site parking; and a monthly overhead that's on your side.

For more information please contact:

It could be your best move all day.

Doctors Take Note:

Sept. 27th, The Dept. of Surgery of St. Agnes Hospital Balto., is presenting a **Primary Care Symposium**. This one-day Symposium is for the Internist, General Practitioner and Family Practitioner, in the St. Agnes Nursing Auditorium. Some of the topics to be presented are the Office Management of Chronic Pain, the Detection of the Drug-Abusing Patient, Evaluation of Intra-Oral Lesions, and the Diag. of the Depressed Patient. This meeting is acceptable for five credit hours from the AMA and also from the AAFP. Registration fee is \$20 for the meeting and this includes a luncheon. For further info., call Dr. John A. Singer, (301) 368-6377.

in meeting nationwide pressures for a new type of generally-trained health executive, R_xMBA concentrates on training executives broadly and rigorously in analytical approaches to problem-solving and policy-planning. It prepares participants for a variety of organizational settings and addresses issues of personal, community and environmental health services through marketing, financial and planning systems already successfully implemented by business corporations.

Dr. Robert Austin Milch, Professor of Health Care Management in Loyola's Business Administration Department, directs the program. Dr. Milch holds degrees from Columbia University and from Loyola, and is former Professor of Orthopedic surgery at Johns Hopkins University School of Medicine. He served as special assistant in the White House Office of Science and Technology during the Johnson Administration and, most recently, was a principal in the management consulting department of the Washington, DC office of Peat, Marwick Mitchell and Co. □

CONTINUING MEDICAL EDUCATION

Mr. President and Members of the House of Delegates:

Six meetings of the CME Committee were held during the Faculty year of 1978-79, with action taken by the Committee in the following areas:

Since the initiation of the accreditation process, the following hospitals/organizations have been granted institutional accreditation following site surveys:

1. *American Cancer Society—Baltimore City Unit.
2. +American Heart Association—Baltimore.
3. +Ann Arundel General Hospital—Annapolis.
4. Bon Secours Hospital—Baltimore.
5. Calvert Memorial Hospital—Prince Frederick.
6. Chestnut Lodge—Rockville.
7. +Children's Hospital—Baltimore.
8. Church Hospital—Baltimore.
9. Community Psychiatric Clinic, Inc.—Wheaton.
10. *Crownsville Hospital Center—Crownsville.
11. *Department of Health and Mental Hygiene—Baltimore.
12. Doctors' Hospital of Prince George's County—Lanham.
13. Dorchester General Hospital—Cambridge.
14. Fallston General Hospital—Fallston.
15. Franklin Square Hospital—Baltimore.
16. Frederick Memorial Hospital—Frederick.
17. *Good Samaritan Hospital—Baltimore.
18. Greater Baltimore Medical Center—Towson.

19. Harford Memorial Hospital—Havre de Grace.
20. Holy Cross Hospital—Silver Spring.
21. Lutheran Hospital of Maryland—Baltimore.
22. Maryland General Hospital—Baltimore.
23. Maryland Hospital Education Institute—Lutherville.
24. Maryland Radiological Society—Baltimore.
25. *Maryland Psychiatric Society—Baltimore.
26. +Memorial Hospital—Easton.
27. *Memorial Hospital—Cumberland.
28. Mercy Hospital—Baltimore.
29. Montgomery General Hospital—Olney.
30. +Montgomery Village Seminars—Gaithersburg.
31. The Neurology Center—Chevy Chase.
32. North Arundel Hospital—Glen Burnie.
33. +North Charles General Hospital—Baltimore.
34. Peninsula General Hospital—Salisbury.
35. Post Graduate Institute—Cheverly.
36. Prince George's General Hospital—Cheverly.
37. Provident Hospital—Baltimore.
38. Sacred Heart Hospital—Cumberland.
39. St. Agnes Hospital—Baltimore.
40. +St. Joseph Hospital—Towson.
41. Sheppard and Enoch Pratt Hospital—Towson.
42. Sinai Hospital—Baltimore.
43. South Baltimore General Hospital—Baltimore.
44. Springfield Hospital Center—Sykesville.
45. +Spring Grove Hospital—Baltimore.

46. Suburban Hospital—Bethesda.
47. Taylor Manor Hospital—Ellicott City.
48. Union Memorial Hospital—Baltimore.
49. +Veterans Administration Hospital—Perry Point.
50. +Washington Adventist Hospital—Takoma Park.
51. Washington County Hospital—Hagerstown.

Survey pending for:

52. Kernans Hospital—Baltimore.

Accreditation pending for:

53. Greater Laurel Beltsville Hospital—Laurel.

NOTE: *—indicates accreditation granted during 1978-79.

+—indicates accreditation renewed during 1978-79.

Those hospitals/organizations having no marking were site surveyed and granted accreditation in previous years.

Other Action:

A. In response to a request, the Committee considered whether verifying physician attendance should be discontinued at the Annual and Semi-annual Meetings. The Committee concluded the present voluntary system is flexible and reasonable and would not support any effort to discontinue it.

B. The Bylaws of the Committee have been revised and updated to reflect the true scope of the Committee.

C. A policy statement was formulated limiting cosponsorship of CME activities to component and/or statewide specialty societies.

D. The Committee reviewed and accepted revised guidelines on the types and duration of accreditation issued by the Liaison Committee on Continuing Medical Education.

E. Negotiations with the LCCME led to the reversal of their decision to deny renewal of accreditation to a local institution. Provisional accreditation was ultimately granted.

F. The Committee continues to be deeply concerned over the numerous problems related to the accreditation process since the Liaison Committee on Continuing Medical Education assumed authority several years ago. The intolerable delays, and the fact that the state committees have not been kept well-informed by the LCCME, led the Committee to develop a resolution calling for the return of accrediting authority to the state organizations whose standards are in agreement with the American Medical Association and the LCCME. Further, that failing such an agreement, the Medical Faculty cease recognition of the LCCME as accrediting authority for CME in Maryland, and concern itself only with the CME needs of the physicians in Maryland as mandated by the Board of Medical Examiners. The resolution was

CME COMMITTEE CHAIRMAN C. EARL HILL, MD (center) shakes hands with Dr. Edward J. Kowaleski (right), Professor and Chairman of the Family Practice Program at the University of Maryland School of Medicine, at a recent function of the Maryland Academy of Family Practice, as Hans J. Koetter, MD (left) applauds.

Merrell

Bentyl®

(dicyclomine hydrochloride USP)

Capsules, Tablets, Syrup, Injection

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATIONS

Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the following indications as "probably" effective:

For the treatment of functional bowel/irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

THESE FUNCTIONAL DISORDERS ARE OFTEN RELIEVED BY VARYING COMBINATIONS OF SEDATIVE, REASSURANCE, PHYSICIAN INTEREST, AMELIORATION OF ENVIRONMENTAL FACTORS.

For use in the treatment of infant colic (syrup).

Final classification of the less-than-effective indications requires further investigation.

CONTRAINDICATIONS: Obstructive uropathy (for example, bladder neck obstruction due to prostatic hypertrophy); obstructive disease of the gastrointestinal tract (as in achalasia, pyloro-duodenal stenosis); paralytic ileus, intestinal atony of the elderly or debilitated patient; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; myasthenia gravis. **WARNINGS:** In the presence of a high environmental temperature, heat prostration can occur with drug use (fever and heat stroke due to decreased sweating). Diarrhea may be an early symptom of incomplete intestinal obstruction, especially in patients with ileostomy or colostomy. In this instance treatment with this drug would be inappropriate and possibly harmful. Bentyl may produce drowsiness or blurred vision. In this event, the patient should be warned not to engage in activities requiring mental alertness such as operating a motor vehicle or other machinery or perform hazardous work while taking this drug. **PRECAUTIONS:** Although studies have failed to demonstrate adverse effects of dicyclomine hydrochloride in glaucoma or in patients with prostatic hypertrophy, it should be prescribed with caution in patients known to have or suspected of having glaucoma or prostatic hypertrophy. Use with caution in patients with: Autonomic neuropathy. Hepatic or renal disease. Ulcerative colitis. Large doses may suppress intestinal motility to the point of producing a paralytic ileus and the use of this drug may precipitate or aggravate the serious complication of toxic megacolon. Hyperthyroidism, coronary heart disease, congestive heart failure, cardiac arrhythmias, and hypertension. Hiatal hernia associated with reflux esophagitis since anticholinergic drugs may aggravate this condition.

Do not rely on the use of the drug in the presence of complication of biliary tract disease. Investigate any tachycardia before giving anticholinergic (atropine-like) drugs since they may increase the heart rate. With overdose, a curare-like action may occur.

ADVERSE REACTIONS: Anticholinergics/antispasmodics produce certain effects which may be physiologic or toxic depending upon the individual patient's response. The physician must delineate these. Adverse reactions may include xerostomia; urinary hesitancy and retention; blurred vision and tachycardia; palpitations; mydriasis; cycloplegia; increased ocular tension; loss of taste; headache; nervousness; drowsiness; weakness; dizziness; insomnia; nausea; vomiting; impotence; suppression of lactation; constipation; bloated feeling; severe allergic reaction or drug idiosyncrasies including anaphylaxis; urticaria and other dermal manifestations; some degree of mental confusion and/or excitement, especially in elderly persons; and decreased sweating. With the injectable form there may be a temporary sensation of lightheadedness and occasionally local irritation. **DOSAGE AND ADMINISTRATION:** Dosage must be adjusted to individual patient's needs.

Usual Dosage: Bentyl 10 mg. capsule and syrup: *Adults:* 1 or 2 capsules or teaspoonfuls syrup three or four times daily. *Children:* 1 capsule or teaspoonful syrup three or four times daily. *Infants:* ½ teaspoonful syrup three or four times daily. (May be diluted with equal volume of water.) Bentyl 20 mg.: *Adults:* 1 tablet three or four times daily. Bentyl Injection: *Adults:* 2 ml. (20 mg.) every four to six hours intramuscularly only. **NOT FOR INTRAVENOUS USE.** **MANAGEMENT OF OVERDOSE:** The signs and symptoms of overdose are headache, nausea, vomiting, blurred vision, dilated pupils, hot, dry skin, dizziness, dryness of the mouth, difficulty in swallowing, CNS stimulation. Treatment should consist of gastric lavage, emetics, and activated charcoal. Barbiturates may be used either orally or intramuscularly for sedation but they should not be used if Bentyl with Phenobarbital has been ingested. If indicated, parenteral cholinergic agents such as Urecholine® (bethanechol chloride USP) should be used.

Product Information as of October, 1978.

adopted by Council, and has been forwarded to each state, district and territory with the recommendation that they consider and support similar action.

This has been a very busy and productive year for the Committee. The workload requires continuing organization and administrative assistance, in addition to maximum efficiency in the operation of the Committee. My thanks to each and every member of this Committee for their dedicated service and a job well-done.

Respectfully submitted.

HEALTH PLANNING

Mr. President and Members of the House of Delegates:

The Committee on Health Planning met several times during the past year to exercise its responsibility of monitoring the developments in health planning at the local, state, and national levels, and the legislative and bureaucratic changes in the laws, rules, and regulations pertaining to planning activities.

In order to facilitate our efforts in this regard, the Committee recommended and received approval to employ a full-time Health Planning Specialist to monitor the activities of the five local Health Systems Agencies and the State Health Planning and Development Agency. This staff person will establish working relationships with these groups, review drafts of the Annual Health Systems Plan and report on proposed regulations in terms of what effect they may have on the delivery of medical care. He will also work with

Faculty Committees and component societies on matters pertaining to health planning and related matters at all levels. With such professionally-trained staff, the Committee intends to strengthen its ability to monitor activities of the health planning bureaucracy and to influence its policies so that optimal levels of health care may be maintained.

The past year has seen the drafting of the second-year Health Systems Plan by the five Health Systems Agencies in Maryland. These plans were reviewed by the Faculty Planner, and found to represent credible attempts to identify the complexities which are affecting the development of a comprehensive health care delivery system; however, they lacked appropriate and reasonable goals and objectives, especially in the area of health manpower availability and accessibility. Letters were directed to all HSAs delineating the areas of concern to the physician community.

At the State level, the Committee has been closely following the drafting of the State Health Plan. The Executive Director of the State Health Planning and Development Agency met with the Committee to discuss the activities of the Statewide Health Coordinating Council, the State Health Plan, proposed legislation and possible regulations for establishment of Hospices for the terminally-ill.

The Committee has been monitoring the activities of the Appropriateness Review Task Forces which the State Health Planning and Development Agency has established in the areas of Cardiac Surgery/Catheterization, Obstetric/Newborn and Radiation Therapy services. The Task Forces are presently setting standards and criteria for institutional review in these areas. The Faculty's representatives on these Task Forces have been effective in ensuring that rational criteria and standards are developed for this mandated health planning activity.

In the area of legislation, the State Health Planning and Development Agency had proposed the extension of Certification of Need regulations to include private physician offices should capital expenditures for equipment exceed \$150,000. This legislation was defeated during the last legislative session, primarily by efforts of Faculty representatives.

The Chairman wishes to express his appreciation to the members of the Committee for donating their time to the matters of the Committee during the past year. The Committee is confident that the actions taken this year have been sound ones, and is looking forward to an equally productive year ahead.

Respectfully submitted,

AD HOC COMMITTEE ON RESOLUTION 1S/77

*Mr. President and Members of the House
of Delegates:*

This Committee has been in existence since November, 1977, when it held its first meeting. Since that time, considerable discussion and activity has taken place in connection with its charge, which is as follows:

"RESOLVED, that Medical School Faculty members and the Practicing physicians of Maryland are urged to become more cost-conscious and to reemphasize the use of the utmost discretion in admitting patients to hospitals and in ordering ancillary services in patient care."

Most of the Committee's attention has been directed to ancillary services and the costs of such services.

The Committee has met with some resistance in connection with a proposal that all physicians who admit patients to general, acute care hospitals receive a copy of the patient's bill when discharged. In this manner, the physician would become familiar with the cost of various tests ordered either by him, by the house staff or on the basis of standing orders.

It has been learned the Health Services Cost Review Commission is collecting data on ancillary tests by admitting diagnosis and by physician and hospital. This would indicate any startling differences between institutions and physicians. This matter is being closely followed by the Committee.

Early after the appointment of the Committee, a survey was carried out by contacting all hospitals to ascertain what tests are performed on all admissions, either on a mandatory basis or by a negative check-off list. The results provided interesting information to the Committee.

Following this, it was recommended that all hospital medical staffs review these standing orders to ascertain the necessity of such orders. All of this took place prior to the national interests and concerns and the public statement by the National Blue Cross Plan that it would no longer pay for mandatory tests and would only reimburse institutions for tests individually ordered by the physician and pertinent to the admitting diagnosis.

In response to inquiries from the press, we were able to reply in a positive manner as to what was being done in Maryland.

The Committee continues to work closely with the Maryland Hospital Association and plans to follow-up its original survey of hospitals with one to see if any changes have occurred since this matter was brought to the attention of Chiefs of Staff at acute care institutions. The MHA will also direct a letter to the hospital administration urging coordination of activity in this connection.

We are also glad to report that the Department of Health and Mental Hygiene, through its Division of Licensing and Regulation, has revoked its rule requiring mandatory tests for all hospital admissions. The Joint Commission on Accreditation of Hospitals did this some time ago.

Your Committee will continue to work on this matter and, hopefully, can report further progress in its next report.

HARRY F. KLINEFELTER, MD
Chairman □

CURATOR

*Mr. President and Members of the House
of Delegates:*

The past year has been very successful, both in the acquisition of new items and in our program to restore existing portraits. The most significant acquisition is a portrait of Daniel Gilman, the first President of the Johns Hopkins University. Dr. Gilman was a speaker at the Faculty's 100th anniversary celebration in 1899 and at the dedication of the Faculty's building on Cathedral Street. This fine portrait, painted by Paul Hulwig, formerly belonged to Howard A. Kelly, MD, and came to the Faculty through the estate of Howard C. Smith, MD.

In addition, a large number of "antique" medical instruments, including microscopes, electrocardiograph machines, X-ray tubes, surgical kits, etc., have been donated to the Faculty. These contributions are regularly listed on the Library Page in the *Journal*.

As of this writing, the last of the "second priority" portraits is at the Purnell Galleries for restoration. This completes a major step in the restoration program begun several years ago. During the coming year, the Faculty's portrait collection will be reevaluated for insurance purposes, and priorities will be reset for needed repairs and restoration.

The Faculty's bronze-plaque portrait of Frank Frick was featured in an exhibit at the Walters Art Gallery in February and March, 1979 and the Faculty was appropriately-credited. It is hoped that additional showings of some of the Faculty's treasures can be arranged in the future.

Respectfully submitted,

E. DAVID WEINBERG, MD,
Curator □

PHYSICIAN/PATIENT RELATIONS

*Mr. President and Members of the House
of Delegates:*

The Physician/Patient Relations Committee maintained a monthly meeting schedule during the past year to consider a variety of issues, including such matters as whether certain proposed corporate designations fall within ethical and legal standards. In rendering ethical opinions regarding the participation by physicians in commercial enterprises, the Committee has maintained the policy that a physician may not participate in a corporation from which a profit is obtained if there is any possibility that the physician's patients could be referred to that corporation for care or for testing. Such matters as approval of announcements of the opening or change of offices have also been routinely reviewed by the Committee.

During the past year, the Committee has been involved in over 20 cases referred by the Commission on Medical Discipline. The nature of these cases has ranged from problems in communication to rather serious disturbance in physician/patient relationships, and instances where physicians have been reported by Federal and State authorities. In each of these cases, every attempt is made to interview the complainant for the purpose of establishing optimal physician/patient understanding, and to conduct a thorough investigation for report to the Commission. Aside from providing written statements, many physicians were interviewed in order to obtain a clearer understanding of the facts surrounding each case. In several instances, questions were raised regarding the quality of medical practice, and the practices were, therefore, referred to an appropriate peer review committee for additional attention.

For the first time, the Committee opened liaison with major industries in the state in order to assist the private sector in reducing employee absenteeism relative to physicians' absent from work notes. In several cases, treating physicians were advised of manipulative behavior on the part of certain employees, after which changes were instituted. The Committee also identified several physicians who were rather liberal in granting medical excuses and at least one of these individuals was reported to the Commission on Medical Discipline. The Committee intends to continue this activity since industry, the profession, and society at large can only benefit from our involvement.

The Committee has continued its function as arbitrator between physicians involved in disputes arising from the practice of medicine. These disputes generally involved the referral of patients and more frequently concerned the distribution of medical records after separation from practice. Although the Committee's role as arbitrator becomes difficult at times, it is strongly felt that this function is exercised fairly and with a minimum of negative feeling.

In this era of cost-consciousness, the Committee continues as it has done for many years, to review requests from third-party carriers for determinations of whether certain fees are within a usual and customary range. These matters are referred to appropriate specialty societies for consideration, and the Faculty forwards the determination to the insurance company. This Committee function is exercised with caution and it may have to be modified due to activities of the Federal Trade Commission on the national level.

Advertising continues to be a matter of consideration as public and professional standards evolve. At the present time, the Committee firmly maintains the policy that Maryland law prohibits physicians from advertising except as provided by regulations of the Board of Medical Examiners. Such regulations have been revised and are now in the Antitrust Division of the Maryland Attorney General's office for a determination of legal sufficiency.

The Chairman wishes to extend his gratitude to each of the Committee members for the many hours they have devoted to the Committee's activities. We are all grateful for the opportunity to serve on this necessary Faculty Committee.

MEDICAL ANNALS OF MARYLAND

Mr. President and Members of the House of Delegates:

Continued progress has been achieved toward the publication of a second volume of the *Medical Annals of Maryland*. The intent of this proposed monograph is to present a scholarly account of the Medical and Chirurgical Faculty of the State of Maryland from 1900-25. Included will be resource data on physicians who practiced in Maryland during that period, as well as bibliographic data which will provide reference to all pertinent articles from 1900-78 related to the history of medicine in Maryland. A reader/printer machine has been acquired by the Library so that those interested may review the biographical information compiled by the late John Rührh (1872-1935), during the early part of this Century.

With three exceptions, the segments of Rührh's second volume of the *Medical Annals of Maryland* are now either in print in the *Maryland State Medical Journal*, or are ready for publication during the coming year. The exceptions are

Gastroenterology by Dr. Julius Friedenwald; *Medicine* by Dr. Lewellys F. Barker and *Pediatrics* by Dr. Paul G. Shipley. At this time, the Committee is searching for physicians interested in editing these lengthy manuscripts so that they may better reflect a record of medicine specific to Maryland. Members of the Faculty staff are currently compiling necessary background information regarding the approximate size of the volume in pages, the approximate number of illustrations, the size of the index and other matters so that we can ascertain an estimate of the cost of printing the essays together in a single volume. Once this has been established, the Committee may then carry on a solicitation for advance subscriptions to the volume and in this way, fund the printing of the text. This will be an expensive endeavor and much care will be taken to develop this historical volume at reasonable cost. The Committee appreciates the opportunity to document further the wealth of scientific advancement and tradition inherent in the history of medicine in Maryland.

Respectfully submitted,
HENRY B. WILSON, MD, Chairman
A. McGEHEE HARVEY, MD
R. CARMICHAEL TILGHMAN, MD □

MED-CHI INSURANCE TRUST

Mr. President and Members of the House of Delegates:

The Med-Chi Insurance Trustees serve on the Board of Directors of the Med-Chi Agency and are responsible for the programs offered to the membership.

The Agency staff was reorganized in 1978. A. R. Guidice was terminated and Joseph J. Harrison is directing the overall operations of the Agency. There are now three separate departments: Group programs, Property and Casualty and Life and Financial Planning.

Katherine Downey is in charge of the Group programs. Her department includes the Accident and Health Disability Plan, Major Medical, Business overhead insurance, Group Term insurance and Blue Cross and Blue Shield. The Disability plan is the best in the entire country for the cost. This year, the underwriting requirements were made less strict which will allow members to increase coverages easier. More than \$2,000 of monthly disability coverage is available through the plan at rates far lower than other plans.

The Blue Cross and Blue Shield plan now offers full maternity coverage. This will be important to our younger members and also the employees of the members. Another addition was an alcoholic treatment provision. Diagnostic 4 coverage will be offered as an option to existing Diagnostic 3 coverage.

The Property and Casualty Department includes Professional Liability insurance as well as commercial and personal liability lines. A new office liability package

was developed and offered this year. The INA is the underwriter of this plan specifically designed for the physician at very low costs. Bill Flynn is in charge of the professional liability section and Chip Lewis is our casualty agent, who will visit our members at their request.

The Life Insurance and Financial Planning Department is managed by Carroll Feeley. The Med-Chi Members Retirement Plan falls into this department. Carroll stands ready to assist the members in making a decision regarding their plan. He has the latest information on the plan from the bank and insurance company records.

A new bulletin has been developed for our doctor clients. It contains useful information regarding taxes, finances, and estate planning. The title is "Pulse" and is written to interest physicians.

Harry J. Connolly, MD, the Chairman of the Board, suffered an illness and was unable to continue in this capacity for the entire year. W. Kenneth Mansfield, MD assumed the leadership as Acting Chairman in Dr. Connolly's absence.

The Med-Chi Insurance Trustees are most appreciative of the enthusiastic participation of the members in the programs. This continued support will enable us to make the Agency and its products and service the very best available to doctors in Maryland.

Respectfully submitted,
W. KENNETH MANSFIELD, MD,
 Acting Chairman
HARRY J. CONNOLLY, MD
ADRIAN M. COHEN, MD
ROBERT B. GOLDSTEIN, MD
PAUL F. GUERIN, MD

JOSEPH J. HARRISON, CPA,
 Secretary □

PREVENTIVE MEDICINE AND PUBLIC HEALTH

Mr. President and Members of the House of Delegates:

Under the Chairmanship of Michael L. Levin, MD, the Committee on Preventive Medicine and Public Health met four times during the 1978-79 year.

A number of pertinent issues were submitted by the Subcommittees on Child Welfare, Maternal Welfare, Medical Aspects of Sports, Infectious Diseases, Immunization Practices and Transportation and were discussed throughout the year.

Representatives from the Committees on Emotional Health, Drugs, Occupational Health and Alcoholism and selected Faculty members with an interest in preventive medicine served on the Committee.

Dr. J. Leonard Lichtenfeld was appointed to serve on the Maryland Cancer Information System Committee of the American Cancer Society. Several other oncologists also were appointed. Via an

ACS grant from the National Cancer Institute, the American Cancer Society plans to establish a statewide system of cancer information centers whereby the public may obtain appropriate information relative to diagnosis, treatment, etc. which may be pertinent to patients with or suspected of having a malignant disease. One of the goals of the Cancer Information centers is to provide up-to-date information in a decentralized manner.

Concern was expressed by the Committee on Preventive Medicine and Public Health surrounding the medical input, if any, that was provided into the organizing of the MCIS and, specifically, the decision to decentralize the program. The Committee on Preventive Medicine and Public Health has grave concern regarding the appropriate training of the personnel assigned to staff the telephones under the proposed system. This matter is presently being pursued within the Committee on Preventive Medicine and Public Health.

The Chief Residents of the Preventive Medicine Departments at Johns Hopkins, the University of Maryland and the State Preventive Medicine Administration were invited and participated as advisory members of the Committee.

At the recommendation of the Committee on Preventive Medicine and Public Health, the Council adopted a policy of "no smoking" at all business and professional meetings of the Faculty. Legislation was introduced both on the House and Senate sides of the Maryland General Assembly which would require "smoking" and "no smoking" sections to be designated in public places. Supportive testimony was presented by the Faculty on these bills, however, strong opposition was expressed by the Restaurant Owners Association and the bill was defeated.

The Subcommittee on Transportation, under the Chairmanship of Rudiger Breiteneker, MD, continues to monitor the physician coverage at the BWI Airport. A member of the Committee on Preventive Medicine and Public Health visited with the medical director of the newly-established BWI Medical Facility and discovered that the Facility is equipped to handle minor injuries and minor illnesses on a walk-in basis. This subject is constantly being studied by this Subcommittee. Legislation repealing the motorcycle helmet law passed the General Assembly this year, despite the medical community's strong objections.

The Subcommittee on Medical Aspects of Sports, under the Chairmanship of Eugene Willis, MD, has worked diligently during the past year on the following resolution:

"RESOLVED, That certified emergency medical technicians, nurse practitioners, physician assistants or any other paramedical group, with appropriate training, be used to cover scholastic sports events, i.e., football games, when a physician cannot be obtained, with the stipulation that if the injury is questionable and in all cases of head injuries, the player may not be returned to the game and

"RESOLVED, That the player must be referred to a physician or appropriate medical facility for evaluation and treatment if necessary."

The Committee on Preventive Medicine and Public Health unanimously endorsed this resolution as presented, and will forward it on to Council in the very near future.

The Subcommittee on Medical Aspects of Sports proposed and the Committee on Preventive Medicine and Public Health endorsed the following resolution:

"RESOLVED, That is the opinion of the Medical and Chirurgical Faculty of the State of Maryland that the use of trampolines should be eliminated in elementary and secondary schools in the State of Maryland."

The Subcommittee on Maternal Welfare of Sports is currently seeking information from the Department of Education on the type of courses available for coaches inasmuch as certification is concerned.

The Subcommittee on Material Welfare, under the Chairmanship of John A. Hawkinson, MD, is currently monitoring the proposed regulations governing the practice of nurse midwives. A public hearing was held in February, 1979, at which time the Subcommittee voiced its strong objections to the regulations as drafted and recommended redrafting of such. Subsequent to the hearing, the regulations were referred back to the Board of Examiners of Nurses and the Board of Medical Examiners for further consideration. Presently, the two groups are attempting to resolve their differences.

The Subcommittee requested State Senator Rosalie Abrams to introduce legislation declaring all maternal deaths as medical examiner cases. Inasmuch as 60% of maternal deaths currently receive autopsies, the General Assembly felt no need for this legislation; however, this bill will be introduced again into the 1980 Legislature by the Subcommittee on Maternal Welfare.

Approximately five abortion facilities were inspected by the Subcommittee during the past year and all were found to be in conformance with the Standards for Outpatient Abortion Facilities.

The Subcommittee on Infectious Diseases, under the Chairmanship of Clayton L. Moravec, MD, was presented with a research proposal as prepared by the Nosocomial Infection Program of the State Health Department, of which Edda Sonnenberg, RN, is Chief. An objective of the proposal is to demonstrate a 20% reduction in length of stay due to nosocomial infections within two years of implementing this strategy in participating hospitals. The Committee declined to accept the proposal as presented, inasmuch as the scope is felt to be too broad, the in-depth program is lacking specificity and if a study is to be undertaken, the methodology must be more clearly defined.

The Subcommittee on Child Welfare, under the Chairmanship of Thomas E.

Reichelderfer, MD, considered legislation for a Child Restraint Law, modeled after the current law in Tennessee.

Several legislators were contacted and requested to introduce such a bill requiring children under the age of four to be equipped with a child restraint system. Despite the many physicians who testified in favor of this bill, it went down in defeat.

Liaison was established with the newly-created Office for Children and Youth of the State of Maryland.

DRUGS

Mr. President and Members of the House of Delegates:

With each year, the activity of this Committee becomes busier and busier. During this year, we have met monthly and have interviewed 14 physicians during meetings at the Faculty Building; made visits to at least three physicians' offices; considered 20 amphetamine regulation exemption requests as a whole Committee and have approximately 200 reports from the Division of Drug Control in our file, awaiting some kind of action. The Division of Drug Control continues to monitor pharmacies throughout the state, forwarding reports to this Committee of the prescribing of controlled drugs. Each of these reports requires some action by the Chairman of the Committee, who is also designated as a Consultant to the Department of Health and Mental Hygiene. Usually, initial correspondence with the physician is all that is required

to bring to his attention the fact that there are regulations restricting the prescribing of amphetamines or that additional care might be needed in the prescribing of classified drugs.

During this period of time, we have been contacted by county police departments requesting our assistance in reviewing the practice of physicians who have seemed to be prescribing controlled drugs inappropriately. Other agencies contact this Committee as well. The Health Services Review Division of the Medical Assistance Program requested assistance of this Committee in reducing the quantity of certain drugs being prescribed by physicians, because of the high cost to the Medicaid program; however, there was some difference of opinion as to the criteria for the prescribing of these medications and the Committee has insisted on the physician's right to prescribe according to his best medical judgment.

The new regulations concerning the prescribing of amphetamines have still not been promulgated. A hearing was held and the Committee has disputed two points in the proposed regulations, but has not received confirmation or denial of these points. The final regulations are, we are told, on the desk of the Secretary of Health and Mental Hygiene for signature.

The Committee was requested to assist in determining an appropriate manner in which health care in the Cecil County Jail should be administered and how prescription drugs should be issued. From this, the Committee has developed an interest in the delivery of health care in other county jails. Mrs. Claire Evans, Pilot Project Director for the Project to Improve Care in Jails, will meet with the Committee in the next few months to discuss ways of involving the Committee in this area.

The Maryland Drug Abuse Advisory Cooperative Committee was disbanded during the past year, as its work has been assimilated into other groups.

The Committee took a strong stand opposing the advertising in national newspapers and magazines of an "anti-calorie" capsule and learned that through the efforts of other concerned groups as well, including the FDA, it has been taken off the market. This was an example of absolutely false and misleading advertising, which could have been detrimental to the health of the public.

The Committee continues to express concern for the prescribing of Preludin, since this anorectic drug is meant to be prescribed only for short-term use, according to the PDR. Largely through the efforts of this Committee, however, we believe many physicians have abandoned this method of treating obese patients and have restored to more efficacious means.

The Chairman concluded his tenure as Chairman of this Committee with the May, 1979 meeting and wishes to express his gratitude to all members of the Committee and to staff for the cooperation and dedication shown throughout the past few years.

Respectfully submitted,
KENNARD L. YAFFE, MD, Chairman
RODNEY L. BRIMHALL, MD

NOEL D. LIST, MD
JOHN A. SINGER, MD
ROBERT L. YOUNG, MD
THOMAS G. SINDERSON, MD □

OCCUPATIONAL HEALTH

Mr. President and Members of the House of Delegates:

According to its Bylaws, the Occupational Health Committee shall study and report on all phases of occupational health. Throughout the year, the Committee has directed its efforts toward fulfilling this responsibility. As a new year approaches, we shall work toward continued improvement in this area and maintain effective liaison with organizations/institutions concerned with the health and safety of the working person.

Action of the Committee for the past year is as follows:

1. The Committee discussed action of the Department of Health and Mental Hygiene to encourage the reporting of suspected job-related diseases by physicians. It is vital that this information be reported to the Health Department in order to properly identify employment areas of risk. The Health Department has developed guidelines for the reporting of any suspected occupationally-related diseases. Copies will be forwarded to all physicians in Maryland in the near future. The importance of reporting any suspected job-related illness cannot be emphasized too strongly. The Committee recognizes the difficulties facing the Health Department in this undertaking and agreed to assist and support its efforts in this area. Cooperation of physicians employed in industry, as well as private practice, is the key factor if this project is to be successful.

2. In response to a request from the Division of Labor and Industry, the Committee reviewed a proposed policy statement to establish a comprehensive strategy to eliminate harmful exposures in working environments throughout the state which are known or suspected of causing cancer. While the Committee agreed with the objectives outlined in the statement, its success will depend greatly on whether the Division and the Health Department can work amicably together.

3. At the request of the Preventive Medicine and Public Health Committee, permanent liaison has been established with the Occupational Health Committee.

4. Numerous inquiries concerning industrial/occupational matters were given prompt consideration and response.

5. The Committee sponsored one of the scientific sessions which took place during the Annual Meeting. The formal pre-

sentations were delivered by Stuart M. Brooks, MD, Associate Professor of Medicine and Environmental Health, University of Cincinnati Medical Center and Edward A. Emmett, MD, Professor of Environmental Health Sciences of the Johns Hopkins School of Hygiene and Public Health. Their presentations contributed greatly to the overall success of the meeting.

6. The Committee is planning to conduct a survey to determine the number of physicians employed in occupational medicine on a full-and/or part-time basis.

The Chairman would like to thank all Committee members for their invaluable assistance and support throughout the year.

LONG-TERM CARE

Mr. President and Members of the House of Delegates:

The past year has seen consistent progress in opening appropriate channels for the improvement of quality of care in the State's Skilled and Extended Care Facilities.

In order to focus on issues in the State legislative arena, a meeting was held with State Senator Rosalie Abrams and Delegate Torrey C. Brown, MD in November, 1978. Both legislators indicated that they were quite cognizant of bureaucratic obstacles encountered by geriatric patients as a result of the division of responsibility among the Office on Aging, the Department of Human Resources and the Department of Health and Mental Hygiene. Both have indicated a strong desire to work toward the alleviation of these problems and the Committee has assisted in several areas.

A meeting was held with the Director of the Office on Aging in order to get a clearer description of the organization and function of this unique department. Particular attention was paid to the liaison the Office on Aging has with the Legislature, as well as with the way it handles complaints involving nursing

homes and physicians. Since this meeting, the Committee and Faculty staff have assisted in inquiries of this type.

The Director of the Mental Hygiene Administration also met with the Committee to discuss the four regional State facilities for chronic care. The Committee was also apprised of statistical data describing the reduction of elderly inpatients in the State mental hospitals. Deinstitutionalization of patients is a complex issue requiring the development of improved social, medical assistance and transportation systems.

In order to address the complex socioeconomic issues, over 100 Medical Directors and Principal Physicians throughout the state were invited to attend a seminar related to the provision of quality medicine in the regulated environment of long-term care. Representatives from various State agencies gave presentations and answered questions regarding policies of their agencies. Those agencies represented were the Division of Licensing and Certification, Professional Standard Review Organizations, Baltimore City Hospitals and Faculty staff. It was also during this meeting that the groundwork for the establishment of a Maryland Chapter of the American Association of Nursing Home Physicians was laid.

The Committee wishes to express its appreciation for being given the opportunity to address the wide-ranging issues in long-term care, and would again congratulate those physicians in Maryland for their leadership in this field.

EMOTIONAL HEALTH

Mr. President and Members of the House of Delegates:

The Committee on Emotional Health held eight meetings during 1978-79 to discuss the delivery of mental health services, the current trends in the practice of psychiatry in the state and increasingly important legislative matters.

With the appointment of Dr. Lino Covi to the Governing Body of the Central Maryland Health Systems Agency, Dr. Ronald Taylor was appointed to the Mental Health Coalition. The Coal-

tion's statutory task is to give technical assistance to those hospitals which so desire when making application for approval of a psychiatric wing within their hospital.

Dr. Samuel Blumenfeld served as liaison to the Committee on Prevention Medicine and Public Health during this past year.

Dr. Hirsch was the representative appointed to serve on the Legislative Committee once again. A great deal of legislation which affected the Committee, either directly or indirectly, was discussed by the members over the past year. The Committee on Emotional Health supported the Legislative Committee in its efforts to establish legislation which would exempt all physicians from the jurisdiction of the HSCRC. This bill was amended in the Legislature, in a manner totally unacceptable to the medical profession, and was subsequently defeated by the Faculty.

Much concern of the Committee was the problem of paraprofessionals desiring to practice independently—psychologists in particular. HB 1084, as introduced into the 1979 Legislature, would have allowed psychologists to commit patients without the advice of a physician. Despite the Committee's strong objections, the bill was enacted with the following amendments:

1. The admission of a minor by a parent to a child or adolescent unit for the purpose of diagnosis and consultation which is assented to by two physicians, OR ONE PHYSICIAN AND ONE CERTIFIED PSYCHOLOGIST, may be treated as a voluntary admission for a period not to exceed 20 days.

2. Each application for admission to a facility shall be accompanied by the certificates of two physicians, OR THE CERTIFICATES OF ONE PHYSICIAN AND ONE CERTIFIED PSYCHOLOGIST that the prospective patient has a mental disorder, and for his protection or others, needs inpatient care or treatment.

3. If the petitioner is a peace officer of the rank of sergeant or higher, a duly-licensed physician, A CERTIFIED PSYCHOLOGIST or the local health officer, as described by Sections 46 and 47 of Article 43 or his designee, the emergency admittee shall be taken into custody by a peace officer and transported to an emergency facility where he may be detained for not more than 24 hours without judicial endorsement.

Several bills regarding adoption laws were introduced, however the Committee was of the opinion that this is much more of a social concern, rather than a medical one.

The Committee continued their efforts to determine what type of emergency psychiatric services were available in specific regions in Maryland. Responses received indicated that the services appear adequate, however, a mechanism to assure that these facilities are indeed functioning as the propose to be remains to be found and this matter is presently

under further consideration within the Committee.

Psychiatric training for paramedics was the subject of discussion at several meetings. The President of the Board of Fire Commissioners was contacted in an effort to obtain whether or not psychiatric training was being provided to paramedics and under whose supervision. The Baltimore City Medical Society has established a Medical Advisory Committee to oversee the operation of the ambulance service. A two-day, 16-hour program was developed which included subject material dealing with alcohol related problems, drug abuse programs, violent patient managements, rape and child abuse crisis, suicide prevention and disaster crisis.

The subject of what appeared to be an epidemic of young teenaged pregnancies and how this Committee might handle the primary prevention of such was discussed by the Committee on several occasions. Dr. Janet Hardy recently published an article, *Long-Range Outcome of Adolescent Pregnancy* which the Committee felt adequately answered its concerns.

Dr. Lino Covi served as liaison from the Maryland Psychiatric Society to the Committee on Emotional Health, creating a much more direct line of communication between the two groups. Minutes were exchanged and many legislative matters were mutually-discussed.

MEDICOLEGAL

Mr. President and Members of the House of Delegates:

A substantial part of the practice of law and medicine is concerned with the problems of persons who are in need of the combined services of a lawyer and a physician. Throughout the year, the Medicolegal Committee has worked toward improving the relationship between members of both professions by encouraging a mutual exchange of information and cooperation in order that the needs and interests of the public are best served. As a new year approaches, we shall continue to consider disputes involving both professions, and pursue amicable solutions to these problems.

Action of the Committee for the year is as follows:

1. Twenty-five cases are currently being considered by the Committee which are in various stages of resolution. The Committee has been successful in resolving 23 disputes satisfactorily.

2. Considerable time and effort have been devoted to revising the Medicolegal Code of Cooperation. A special subcommittee has worked long and hard in the development of new language and major changes in the format of the Code. As a new year approaches, our efforts will be directed toward early completion of this most difficult task.

3. The Committee was requested to comment on the appropriateness of "Authorization and Agreement to Pay Forms" when Workmen's Compensation cases are involved. Our response indicated that all fees are subject to the Commission's approval, and disbursement of any award(s) are subject to regulation of the Commission.

4. Numerous inquiries from physicians, as well as the general public, concerning medicolegal matters were given prompt attention and response.

The Chairman would like to thank all members of the Committee for their invaluable assistance and support throughout the year.

EXECUTIVE DIRECTOR

Mr. President and Members of the House of Delegates:

A question is often posed to the Executive Director—"Just who *does* set policy for the Faculty?" It is interesting that this question is even asked, for the only policy-making bodies of the Faculty are as defined in the Faculty's Bylaws. Ultimately, the policy-making body of the Faculty is the House of Delegates, which has the final say on all matters involving Faculty activity. Between meetings of the House of Delegates, the Bylaws give this authority to the Council, excluding the right of overruling any action of the House of Delegates. The Executive Committee of the Council, composed of the Officers, can advise the staff on matters of immediate importance but, in fact, cannot establish policy except in an emergency situation.

Over the years, Faculty policy has been developed by the two bodies authorized to establish such policy. These decisions have been duly-recorded in a *Policy Book* maintained by the Faculty's Executive Director and from the "memory bank" of staff people who frequently can recall with amazing detail and clarity the position of the Faculty on issues that go back many years.

These position statements are taken into account, for instance, when a particular piece of legislation is being considered in Annapolis and there has not been time to convene a meeting of the Legislative Committee. These positions are also taken into account almost weekly as various Faculty Committees meet to discuss issues and to determine what action, if any, is to be taken.

Statements that the Executive Director makes policy, as can be seen from the above, are inaccurate, and such decisions have never been made by the officer.

It is important that all members realize these facts. The House of Delegates, in which proportional representation based on component society membership is held by each component medical society makes policy, which is as it should be. With the new Council, composed again of proportional representation from each component medical society, this also provides for grassroots input into all policy positions of the Faculty.

It is important that persons serving in these capacities representing their local physicians make their views known.

As always, the work of the Executive Director is reflected in the various reports of Committees, officers and others. Without the assistance of a first-class staff, our efforts would be for naught.

Respectfully submitted,

JOHN SARGEANT, CAE
Executive Director □

HOSPITAL-AFFILIATED PHYSICIANS

Mr. President and Members of the House of Delegates:

This Committee held only one formal meeting during the past year. Specifically, this was called to discuss legislation as proposed by the Legislative Committee, in concert with specialty societies, dealing with the HSCRC.

During the year, this Committee has continued to redefine its major purpose and analyze the directions it should take in carrying out its mandated function. There have been two main areas of interest. The first is to make the "Physician who practices within the hospital setting" aware that Med-Chi and this Committee are sensitive to his concerns and anxious to help with problems which develop. The second is to make other physicians aware that the bureaucracy is tending to see little difference in the physician-hospital relationship no matter how much or little time is spent within the hospital.

Advice has been given in several cases where physicians have sought help prior to entering into contracts with Hospitals for their professional services.

MARYLAND STATE SCHOOL HEALTH COUNCIL

Mr. President and Members of the House of Delegates:

The Maryland State School Health

Council in this recent past year has been chaired by Louise Blauvelt, RN, MA. Other officers included, Natalie Mariotti, MPH as Vice Chairperson; Richard L. Gamble, MA, MEd, as Secretary and Martha Taylor Schipper, MD, MPH, as Treasurer.

The School Environment was the subject of the fall conference held in November, 1978. This meeting emphasized current issues related to the school environment, contributions of other disciplines in its development and the environmental needs of students with handicaps. The Adolescent and Alcohol was the timely subject for the spring meeting held in Ocean City, MD. The problem of adolescent drinking was explored relevant to etiology, prevalence, peer pressures and its effects on health and scholastic achievements.

The meetings held through the course of the year in addition to these seasonal conferences, as in the past, included health and student-related subjects. On review of the minutes of the meetings, some of the issues discussed that would be of interest to physicians were vision screening, school lunch programs, developmental evaluation services for the pre-school child, standards for health services and sports medicine.

This is a well worthwhile organization and its interest in the health of our school children cannot be over-emphasized. As I complete my term of representation, I am delighted to say it has been a pleasure to have been associated with the Council.

Respectfully submitted,
RAYMOND P. SRSIC, MD □

JOINT PRACTICES

Mr. President and Members of the House of Delegates:

Optimal health care and effective health planning require interaction and cooperative efforts between all health care providers. As a result of the reorganization in 1976 of the Joint Practices Committee, we believe we have opened larger avenues of communication between all allied professions, in that representatives of all health and social fields can now serve as a united group to consider areas of mutuality of practice in the provision of quality health care. It is our view that the Committee provides a forum to discuss areas of mutual concern, to consider problems common to health and social professions and to work toward satisfactory solutions of these problems.

Immediately following is a report of the Committee business for the year 1978-79:

1. The Committee devoted further discussion to the administration of physical therapy by health professionals other than physicians and physical therapists. Until such time that joint regulations are issued by the Board of Physical Therapy and the Board of Medical Examiners, only physicians and physical therapists can administer physical therapy. This is in accordance with existing law.

2. The problems resulting from the use of multi-prescription blanks by physicians were discussed at length. While there is no law prohibiting their use, the pharmacist representatives outlined two reasons why they should not be used: first, this type of Rx blank frequently includes prescriptions calling for both Class II and Class III drugs. The pharmacist, however, is required to keep separate records of all Class II drugs, necessitating the setting up of two separate filing systems. Secondly, since numerous drugs are listed on the Rx blank, the physician merely checks off the drug to be used in the prescription. In times of stress, it would be very easy to check off the incorrect drug. For these reasons, their use will be discouraged.

3. At the request of the Maryland State Health Planning Agency, the Committee reviewed and accepted a position paper concerning a study on nursing manpower in Maryland, submitted by the Health Manpower Committee in response to recommendations of the Maryland Commission for Nursing.

4. Guests have been invited to attend meetings to express their concerns which relate to areas of practice within the health and social professions.

5. The Committee reviewed legislation enacted this year affecting the various health and social professions serving on the Committee.

6. The Committee was advised that there apparently exists within the medical community a great misunderstanding with respect to how the physician assistant wishes to conduct his/her practice, in that there are many individuals who believe the physician assistant wishes to work independently of the physician. The PAs who serve on the Committee have indicated this is totally incorrect, and requested the assistance of the Committee in resolving this situation. As explained to the Committee, the PA does not want to work independently or in competition with the physician, but rather in collaboration with him, enabling the physician to provide maximum medical services to his/her patients. This is currently being pursued with the Board of Medical Examiners.

As a new year approaches, the Committee is hopeful it shall continue to enjoy the assistance and support of those professions now serving on the Committee. I would also like to express my appreciation to the members of the Committee for giving their time and energies to the matters brought before the Committee during the year.

ALCOHOLISM

Mr. President and Members of the House of Delegates:

In its first year of operation as a full, standing Committee of the Medical and Chirurgical Faculty, the Committee on Alcoholism has held regular monthly meetings to address the medical and socioeconomic issues relative to the disease of alcoholism. This has been done in order to exercise the charge to the Committee of working toward educating the public and the profession with respect to alcoholism as an illness.

The Committee has maintained its broad membership, drawing upon the expertise of physicians, as well as advisory members from the Department of Health and Mental Hygiene, the clergy and representatives of major industries in the Baltimore metropolitan area.

In the area of public education, the Committee has met with representatives of the Maryland State Department of Education regarding existing curriculum on health education and alcohol use and traffic safety developed in 1973. The Committee determined that this curriculum, which is used in most public schools, is in need of updating in order to better present psychiatric and socioeconomic data regarding the effect that alcoholism has on alcoholics and their families. We are pleased to report that the Committee's

interest in this area was well-received and meetings are planned to be held with the Maryland Association of Boards of Education and also the Maryland Congress of Parents and Teachers.

The Committee reviewed a proposal from the Central Maryland Health Systems Agency calling for a requirement that health providers document all alcohol related hospital in-service training programs prior to the issuance of a Certificate of Conformance or Proposed Use of Federal funds by the planning agency. This proposal was reported to Council, after which formal opposition to this recommendation was approved. The Committee is pleased to report that the document was revised so that there would be no mandate for physicians to take Continuing Medical Education courses in one specific disease entity in order to maintain hospital privileges. The Committee continues to maintain liaison with the planning agency through a representative on the Mental Health Coalition. In addition, the Committee has offered its expertise to all health planning agencies in areas relevant to alcoholism.

The Committee has also devoted much attention to the reimbursement policies of insurance carriers for the treatment of alcoholism. Even though alcoholism has been declared an illness with psychological and organic factors by the American Medical Association and by the Faculty, major insurance carriers, including Blue Cross, continue to utilize only psychiatric criteria in computing costs of carriers, including Blue Cross coverage. The Committee has initiated liaison with major insurance carriers in order to work toward broadening the coverage for the benefit of patients as well as to contain costs. In doing so, the Committee assisted in the development of Resolution 1A/79 introduced by the Baltimore City Medical Society Delegation and adopted by the House of Delegates on May 5, 1979.

The Committee on Alcoholism will continue to address the many issues in this area. The Chairman wishes to take the opportunity to express his appreciation to each Committee member for their services to the Faculty.

PEER REVIEW

Mr. President and Members of the House of Delegates:

This has been a busy year, sometimes rewarding and often frustrating. The Committee held nine meetings, each lasting from 3½-5 hours.

The following statistics only begin to tell the story of the activity of this Committee:

Physicians interviewed at Faculty Building	9
Physicians interviewed at their offices	22
Recommendations for disciplinary action	12
Referred to Component Societies for review	16
Pending with Components, Commission or Med-Chi	52

These cases do not include cases referred directly to the component societies by the Commission on Medical Discipline where Med-Chi is not involved.

It has become increasingly important for peer review committees, whether at Med-Chi or at the component level, to meticulously plan and document every review of a physician's practice. As the investigating arm of the Commission on Medical Discipline, it is every peer review committee's responsibility to present reasonable evidence of less than good practice which can stand close and unbiased scrutiny. There is some feeling that this may not be the proper role of physicians; however, it is vital that everyone be given "due process" before any disciplinary action is taken against them. There is no substitute for careful and thoughtful peer review, and the physician being reviewed has a right to expect it.

Because the Med-Chi Peer Review Committee has had perhaps the widest experience in conducting peer review (although some component societies have, indeed, been extremely active and effective), a seminar on the methodology of peer review is planned for the latter part of this year, in cooperation with the Commission on Medical Discipline. Video tapes will be prepared of mock peer review committee and Commission hearings, which other peer review committees may find useful. Representatives of component and specialty societies have an open invitation to meet with the Med-Chi Peer Review Committee to discuss any problems they may be having or to obtain assistance in conducting their own reviews.

My tenure as chairman will end with the Annual Meeting, and it is with mixed pride and sadness that I leave the Committee. I believe we have opened up

some new opportunities for the physicians in this state to improve the quality of patient care.

Respectfully submitted,

PUBLIC RELATIONS

Mr. President and Members of the House of Delegates:

This year saw the realization of a number of long-term projects. The Green-spring Dairy used a health information panel describing the Heimlich Maneuver supplied by the Faculty during the month of March, 1979. A credit line for Med-Chi also appeared on the panel. This was the result of nearly a year of negotiation with a number of dairies.

The Tel-Med telephone health information system will be implemented in Maryland in the near future with the Faculty taking the lead. Coordination of the project, which includes participation from both Baltimore City and Baltimore County Medical Societies, the Health and Welfare Council of Maryland, and Blue Cross and Blue Shield among others, will be in the hands of the Faculty. The statewide project is an ambitious one which will require outside funding in excess of \$100,000 for the purchase of the equipment for 15 locations around the state, representing the direct-dial calling areas. Work on a statewide system has been underway for two years. Subcommittees with representation from all areas of the state and from various interested groups have been formed to implement various aspects of the program—funding sources, local sponsor requirements and equipment purchase. The Committee decided to use the Tel-Med equipment and tapes after examining a number of alternatives.

The Faculty cooperated in the American Medical Association national advertising campaign, placing approximately \$4,000-worth of advertising in local newspapers throughout the state.

WBJC-FM (92.6) approached the Faculty in November, 1978 requesting participation in a telephone radio talk program. Council approved funding for the program, called *Consultation*. The show is heard every other Wednesday evening

from 6:30-8 PM. This program gives the Faculty some on-going media exposure that has been lacking in the recent past.

Public Relations Chairman Raymond J. Donovan, Jr., MD received a First Place award in the AMA speakers' contest in the radio interview category. J. Roy Guyther, MD, Faculty Council Vice Chairman, won a Second Place award for presentation before a professional audience in the same contest. As a result of these two awards, the Faculty received checks totaling \$1,500.

Dr. Donovan is a member of the AMA National Speakers Bureau, as well as being a spokesman for the Faculty. In these two capacities, he completed a total of 18 assignments during the year, including a debate on National Health Insurance with Congressman James Corman at the University of Pennsylvania.

As part of an on-going communication program with representatives of the major media outlets, Faculty President Francis C. Mayle, MD, Executive Director John Sargeant and Communications Director Elza Davis met with the members of the *Sunpapers* editorial staff to discuss matters of mutual interest. The cost of health care was high on the list of items mentioned by the editors. They wanted to know why the costs are high, and what physicians are doing to help. The conversation was wide-ranging and served to reinforce the Faculty's position as a resource for medical information in the community.

**PHYSICIAN
REHABILITATION**

Mr. President and Members of the House of Delegates:

This Committee met 10 times in the past year to discuss a wide variety of subjects and problems. New ideas are constantly being presented and the need for additional physician and public education becomes more and more apparent. Other professional groups (nurses, dentists and lawyers) have sought our advice in setting up similar types of programs. All possible cooperation is being given by members of this Committee.

The following statistics will indicate to some extent the effectiveness of the Committee to date:

Total number of physicians reported since inception of the Committee	61
Alcohol dependent	26
Other chemical dependency	14
Both	7
Psychiatric illness	13
Physical illness	1
Improved or recovered	31
Currently in treatment	12
Unable to contact or refused assistance	5
Left state or retired	5
Died	2
Returned to abuse	6

One of the most valuable and important advances accomplished in this year was the establishment of a new group therapy program in Baltimore. This program is about full at this time, and plans are being made for additional therapy programs to be set up in both the eastern and western parts of the state.

Another idea which has been pursued is that of preparing some sort of program which would produce an insight into

those factors which might indicate the potential of abuse or addiction to chemical substances. Representatives of the University of Maryland School of Medicine are investigating the possibility of devising a questionnaire to be presented to medical students as well as to practicing physicians, which would be used to anticipate possible future problems. It is acknowledged that this is a very difficult and complicated task, but one that needs attention and a great deal of attention will be centered on this program during the coming year.

The Committee was instrumental in obtaining additional insurance coverage for the illness of chemical dependency through the Med-Chi insurance program. This was an area long in need of updating.

The American Medical Association requested that this Committee be represented at a National Conference on the Impaired Physician in Minneapolis, MN to present the protocol prepared by the Committee. This proved to be a very well-attended and successful meeting. An invitation has been issued to have the next conference in Baltimore, possibly in 1980.

The Chairman and Vice Chairman of the Committee have appeared on several television programs to explain the purpose of the Committee and its experience. While press coverage has not been actively sought, there has been interest on the part of several writers, and several stories, mostly favorable, have appeared in several newspapers.

A new Subcommittee of this Committee has recently been set up for the purpose of preparing programs for retiring physicians which would provide them financial and professional comfort. One reason many physicians practice longer than their motor and mental skills would indicate is because they have no other interests or abilities. It is hoped that this Committee may develop something that will be of benefit to this group of our colleagues.

The Committee sponsored a three-hour program at the Faculty's Annual Meeting at Hunt Valley, besides sponsoring a booth. While attendance at the program was somewhat disappointing, plans are presently being laid for a more dynamic program at the next Annual Meeting, in a more popular time spot so that more attention may be given to it.

Members of this Committee have devoted many hours and much of their personal energies to this Committee. I wish to express my appreciation to each of them.

Respectfully submitted,

MAXWELL N. WEISMAN, MD
KENNARD L. YAFFE, MD □

EMERGENCY MEDICAL SERVICES

Mr. President and Members of the House of Delegates:

Throughout the year, the Emergency Medical Services Committee has concerned itself with issues pertinent to emergency medical care services provided the general public. As a new year approaches, we shall continue to direct our efforts toward continued improvement in this area and maintain effective liaison with organizations/institutions concerned with such services.

Action of the Committee for the past year is as follows:

1. The Committee devoted considerable discussion to the problem of liability imposed upon emergency physicians when patients are admitted through the emergency room. The main concern is at what point does the emergency physician relinquish responsibility for care of the patient, and at what point is liability terminated. The Faculty's legal counsel has advised that unless the patient's welfare is in jeopardy, the emergency physician should keep the patient in the emergency room until the attending physician has arrived at the hospital to admit the patient, and assume clinical responsibility from that point on. Following lengthy discussion, it was agreed that the patient who leaves the emergency department for an inpatient area after the attending has been notified and has given verbal orders to the nurse, presents a continuing responsibility to the emergency physician, shared with the attending physician, until the actual arrival of the attending physician. Therefore, it is incumbent upon all hospital governing boards, administrations and medical staffs to address the question and arrive at appropriate guidelines for timely arrival of attending physicians. Failure to address this question may create a situation in which deterioration of a patient's condition occurs during an excessive period of absence by the attending physician. Leaving the responsibility entirely with the emergency physician for long periods of time only increases his liability exposure without decreasing that of the hospital or attending physician. It was the consensus of the Committee that during evening and weekend hours, the hospitals' liability would be decreased if coverage by an in-house physician were arranged by contract rotation of the medical staff or other suitable arrangements.

2. In response to a request from the Maryland Institute for Emergency Medical Services, the Committee reviewed and accepted information to be published in Baltimore area phone books concerning the availability of emergency medical services and/or treatment in emergency/

disastrous situations. This was endorsed by the Council and will appear in a forthcoming issue of the white page phone book.

The Chairman would like to thank all members of the Committee for their invaluable assistance and support throughout the year.

ed as a recipient of the award for his pioneering work in the treatment of shock and trauma, the development of emergency medical service systems and his work in thoracic surgery and hyperbaric oxygen therapy.

Director of the nation's first clinical trauma center, Dr. Cowley came to Baltimore following graduation from the University of Utah to enter the University of Maryland School of Medicine. Dr. Cowley ultimately joined the University of Maryland as the founder and head of the first accredited thoracic surgery program on the East Coast.

Dr. Cowley's research into the causes of shock and the treatment of shock and trauma developed into the establishment of a two-bed

DR. COWLEY

Doctors in the News

Dr. Cowley Honored

Dr. R. Adams Cowley, Director of the Maryland Institute for Emergency Medical Services (MIEMS), has been named 1979 Distinguished Alumnus by the University of Utah.

The Distinguished Alumnus Award is the highest honor bestowed by the University of Utah Alumni Association upon a former student. Dr. Cowley is a 1939 graduate of the University.

The award program was initiated in 1958 to recognize those Alumni who have "Served the nation, the University or their profession with distinction." Dr. Cowley was select-

ed as a recipient of the award for his pioneering work in the treatment of shock and trauma, the development of emergency medical service systems and his work in thoracic surgery and hyperbaric oxygen therapy. Director of the nation's first clinical trauma center, Dr. Cowley came to Baltimore following graduation from the University of Utah to enter the University of Maryland School of Medicine. Dr. Cowley ultimately joined the University of Maryland as the founder and head of the first accredited thoracic surgery program on the East Coast.

Dr. Cowley is a pioneer in a number of other surgical and program areas. He was a leader in the development of the first transistorized pacemaker, the first artificial blood

vessel and the first self-contained, self-balancing monitoring system. In addition to establishing the nation's first shock trauma unit, he co-developed the first civilian helicopter program for the transportation of critically injured patients, and advised the US Senate on the formulation of the nation's EMS legislation.

Under Dr. Cowley's leadership, Maryland has continued to lead the nation in the development of emergency medical service systems. Maryland initiated the nation's first multi-state EMS consortium, the Mid-Atlantic EMS Council, to resolve interstate EMS concerns such as reciprocity, transportation and communications compatibility. The Institute hosted the first international symposium on trauma and has implemented the nation's first multi-level trauma referral system and the first comprehensive EMS communications system as well.

Most recently, Dr. Cowley was appointed to President Jimmy Carter's National Highway Safety Advisory Committee, for which he chairs the Subcommittee on Emergency Medical Services.

Hopkins Study Aims to Find Who Needs New Insect Sting Allergy Treatment

An effective new therapy that prevents life-threatening allergic reactions to insect stings has been approved by the Federal Food and Drug Administration. The availability of the treatment offers peace of mind to the one-two million people in the United States thought to have severe insect sting allergies, but it also presents a dilemma to physicians who treat people with these allergies, according to Drs. Martin Valentine and Lawrence Lichtenstein, developers of the treatment.

The therapy, a series of injections of gradually increasing amounts of pure insect venom, has "blocked" the allergic reaction mechanism in 95% of children and adults studied by the Johns Hopkins scientists who developed the therapy. Without the new allergy shots, those people allergic to insect venom

could have experienced sting reactions such as difficulty in breathing, a drop in blood pressure, unconsciousness or even death, but Drs. Lichtenstein and Valentine point out that there is still no good test to predict who is most at risk for such serious allergic reactions and who needs the expensive and potentially lifelong treatment. The scientists are seeking volunteers for two studies they hope will help them determine which people stand to benefit the most from the new therapy.

For the first study, they are seeking people, 18 years of age and older, who were stung in the past year without a reaction or with only minor redness and swelling, to see what percentage of them has become unknowingly allergic. According to the Hopkins scientists, some people who have been sensitized, but suffered no reaction when previously stung might be in danger of suffering a serious reaction the next time they are stung. They hope to discover how many of these unknowingly allergic people will lose their sensitivity to insect venom, how long it takes to lose it and how much of a health risk they face the next time they are stung. To volunteer for this study, call the Allergic Disease Center at (301) 323-2200, ext. 458.

For the second study, the scientists are seeking children between three and 16 years of age who have experienced an allergic reaction in the past. They point out that scientists still don't know whether a person who had an allergic reaction in the past will have a worse, similar or milder reaction if stung again. They are looking at children because many youngsters lose their sensitivity to stings over time, and some get more severe reactions with each sting. Those children who would lose their sensitivity quickly might not need venom therapy. Parents and doctors who would like to refer a child to the study should call the Allergic Disease Center at (301) 323-2200, ext. 394.

According to Drs. Valentine and Lichtenstein, who are co-directing the insect sting studies, there are

three types of reactions to insect stings: most people, when stung by a yellow jacket, honeybee, hornet or wasp, will have a "normal" reaction consisting of pain and swelling at the site of the sting, lasting less than 24 hours. A small number of people will have a "Non-life threatening generalized reaction" to the sting. They may itch all over, break out in hives and swell on the face and the extremities. Most serious is the "life-threatening generalized reaction," which is accompanied by difficulty in breathing, a drop in blood pressure, unconsciousness and, rarely, death. It is people in danger of suffering from the third type of reaction that the Hopkins team hopes to be better able to identify through their latest studies.

Dr. Patz to Head Wilmer Eye Institute at Hopkins

Arnall Patz, MD, the man who eliminated the foremost cause of blindness in children and pioneered the use of the laser to treat certain eye diseases, has been named Director and Ophthalmologist-in-Chief of the Wilmer Ophthalmological Institute of the Johns Hopkins Hospital and Professor and Director of the Department of Ophthalmology at the Johns Hopkins School of Medicine, effective July 1, 1979.

He succeeds Dr. A. Edward Maumenee, one of the nation's most preeminent ophthalmologists and a noted ophthalmic surgeon, who has directed Wilmer for 24 years. Dr. Maumenee will continue on the full-time staff, participating in surgical and teaching programs of the Department of Ophthalmology.

In the 1950s, Dr. Patz found that excess oxygen administered to premature babies in incubators caused a disease called retrolental fibroplasia, then the major cause of blindness in children. For that discovery he received many honors, including the Albert Lasker Award and the Mead-Johnson Award, both in 1956.

In the late 1960s, Dr. Patz and his collaborators from the Hopkins Applied Physics Laboratory pioneered in the development of the

argon laser and in its use to seal hemorrhaging blood vessels in the retina. This condition occurs in a complication of diabetes called diabetic retinopathy. Dr. Patz served as Deputy Chairman of a National Eye Institute-sponsored 16 hospital study that proved the benefits of laser treatment. As a result, the risk of blindness for thousands of diabetic patients has been substantially reduced.

Most recently, Dr. Patz has directed a team of investigators studying the role of substances which may cause growth of abnormal new blood vessels in the eye. Because of the broad impact of his studies, he has been named next recipient of the Friedenwald award, the leading research prize in American ophthalmology. The Award is named for the late Dr. Jonas Friedenwald, a pioneer research scientist at Wilmer in the 1930s and 1940s.

The Wilmer Institute was founded in 1925 and named after its first director, Dr. William H. Wilmer, who retired in 1934. His successor was the late Dr. Alan C. Woods, who served until 1955, when Dr. Maumenee became Chairman. Under their combined leadership, the Wilmer Institute has become an internationally-renowned eye center.

A native of Georgia, Dr. Patz is a graduate of Emory University Medical School. He interned at Sinai Hospital in Baltimore and received residency training in Washington. In 1955, he joined the Hopkins faculty, but continued a private practice in ophthalmology until 1973, when he became a member of the full-time staff. He is a consultant at Maryland General Hospital, Sinai and the Greater Baltimore Medical Center.

Dr. Patz is the Seeling Eye Research Professor at Hopkins and Director of its Diabetic Retinopathy and Retinal Vascular Centers, where ophthalmic scientists from throughout the world have come to study.

His interest in teaching, as well as research, has lead him to develop numerous award-winning films and scientific exhibits, in addition to authoring nearly 140 scientific ar-

ticles, editing scientific journals and writing a textbook, **Protection of Vision in Children.**

He is married to the former Ellen Levy, a cytotechnologist in the Division of Cytopathology at Hopkins Hospital. They have three sons and a daughter.

Hopkins Names Dr. Lee Riley Chairman of Orthopedic Surgery

Lee H. Riley, Jr., MD, a pioneer in developing artificial joints, has been named Chairman of the Department of Orthopedic Surgery at the John Hopkins School of Medicine and Orthopedic Surgeon-in-Charge at the Johns Hopkins Hospital, effective July 1, 1979, when he succeeded **Robert A. Robinson, MD.**

In the late 1950s and early 1960s, Dr. Riley became known for developing, with Dr. Robinson, an approach to operating on the spinal column in the neck that made such operations after and easier to perform. This anterior approach to the cervical spine was particularly important because neck problems—caused by injuries, tumors, infections, arthritis and other diseases—occur so frequently.

In the early 1970s, Dr. Riley was a leading member of a group that developed the first practical, artificial, total-knee joint. This design proved to be the model for several subsequent total-knee replacement devices.

In 1969, Dr. Riley, Dr. Robinson and Dr. **Gerald Finerman** performed one of the first artificial total-hip joint replacements in this country. The artificial hip has given a new lease on life to many arthritics who were in extreme pain and could only move their own hip joints stiffly, if at all.

Dr. Riley "Is clearly a leader in the field of orthopedic surgery, and his name was introduced for our consideration by a majority of the department chairmen and consultants who were contacted, as well as by nearly all the members of the local orthopedic community," said the report of the committee, which voted unanimously to nominate him.

Dr. Riley received his BA and MD degrees from the University of Oklahoma. He served his internship and residency at Johns Hopkins, where he also held a Surgical Research Fellowship in 1958-59. Before joining the Hopkins faculty in 1963, Dr. Riley was Orthopedic Research and Educational Foundation Fellow in Pathology at the Armed Forces Institute of Pathology. He was Chief of Orthopedic Surgery at Perry Point Veterans Administration Hospital and has served as a consultant to the Federal Food and Drug Administration.

Dr. Riley has been active in increasing communications with Russian orthopedists and was a member of the US delegation to the USSR Committee on Health Cooperation in 1974. Born in St. Louis, MO, he is married to Helen Mutch Riley and has two sons.

Dr. Riley succeeded Dr. Robinson, one of the nation's leading authorities on replacement of complete joints and developer of an operation to remove spinal discs. Chairman of the Department since 1953, Dr. Robinson will continue on the full-time staff of the medical school and hospital. In addition to caring for patients, he directs a major research project funded by the National Institute of Arthritis, Metabolism and Digestive Diseases to study the composition of connective tissue. Friends and former students of Dr. Robinson are collecting gifts and pledges to endow a professorship in his name. Almost \$800,000 of the required \$1 million has already been raised.

Research Into Viral Infections During Pregnancy Earns Hopkins Scientist Cerebral Palsy Award

Richard T. Johnson, Eisenhower Professor of Neurology at the Johns Hopkins School of Medicine, has received the United Cerebral Palsy Research and Educational Foundation's Weinstein-Goldenson Award for Medical Research for his work in viral infections which affect the fetal nervous system, causing dis-

orders such as cerebral palsy. The award was presented at the United Cerebral Palsy National Conference in Atlanta recently.

Viral infections during pregnancy may play a far greater role in causing cerebral palsy than previously suspected, according to Dr. Johnson. "We don't know the magnitude of the problem yet, but rubella, the cytomegalovirus and several other infections during pregnancy can have both major and subtle effects on the brain of the developing fetus, causing motor disabilities which are collectively called cerebral palsy," he explains. "We also know that the average woman during pregnancy has multiple viral infections. Some may cause her no more than the symptoms of the common cold, and some may cause no symptoms at all. Whether these infections cause damage to the developing fetus is unknown."

Dr. Johnson has shown that a number of viruses can cause hydrocephalus, that a sheep vaccine virus can cause abnormalities in lambs similar to those commonly found in children with cerebral palsy, that a rat virus in newborn hamsters infects very specific cells preventing the hamsters from developing motor control as they mature and that many viruses can infect the developing inner ear, affecting structures critical to normal movement.

"Our present challenge is to determine whether similar infections in the human fetus or newborn do similar damage. We have already obtained some data indicating that mumps virus may occasionally cause hydrocephalus in children, and we are now devising more sensitive methods to detect mumps and other viruses in children with varied forms of cerebral palsy," Dr. Johnson says.

Dr. Nathans Elected to National Academy of Sciences

The National Academy of Sciences announced recently the election of 60 new members in recognition of their distinguished continuing achievement in original research. Among the outstanding

scientists and engineers so honored were **Daniel Nathans, MD**, Boury Professor and Director of the Department of Microbiology and Manfred Mayer, PhD, professor of microbiology, at The Johns Hopkins University School of Medicine.

The election was held during the business session of the 116th Annual Meeting of the Academy. Election to membership in the Academy is considered to be one of the highest honors than can be accorded an American scientist or engineer.

Dr. Nathans was honored last year as a winner of the 1978 Nobel Prize in medicine or physiology, which he shared with **Hamilton O. Smith, MD**, Professor of Microbiology at Hopkins, and **Werner Arber, MD**, of Basel, Switzerland. The three were chosen for their work with restriction enzymes, the so-called "chemical knives" which have revolutionized molecular biology by enabling researchers to precisely cut DNA, thereby opening up a new era in the study of how DNA, the genetic blueprint, functions.

Dr. Nathans came to Hopkins in 1962 as an Assistant Professor of Microbiology and became Director of the Department in 1972. A native of Wilmington, DE, he received his MD degree in 1956 from Washington School of Medicine in St. Louis, MO.

The National Academy of Sciences is a private organization of scientists and engineers dedicated to the furtherance of science and its use for the general welfare. The Academy was established in 1863 by a Congressional Act of Incorporation signed by President Abraham Lincoln which calls upon the Academy to act as an official advisor to the Federal government upon request in any matter of science or technology.

Germans Honor Russell Morgan, former Hopkins Medical Dean, for Radiology Milestones

Russell H. Morgan, MD, Dean Emeritus of the Johns Hopkins University School of Medicine, received the German Roentgen Medal, given for outstanding ad-

vances in radiology, in Remscheid, Germany recently. Attending the ceremony was the President of the Federal Republic of Germany, Walter Scheel, and his wife, Dr. Mildred Scheel, who is a Radiologist.

Dr. Morgan's perfection of image intensification in radiology improved X-ray images for diagnostic purposes and was considered as significant an advance in the 1960s as CAT scanners have become in the 1970s.

Dr. Morgan was also one of the first radiologists to become actively involved with the problems of radiation safety and the control of radiation hazards as a public health concern. He called early for the epidemiological evaluation of X-ray exposure received by patients in diagnostic tests and authored several books concerned with radiation safety.

In 1958, he recommended that radiation safety standards and health research be centralized in a single agency, and that research focusing on radiation health effects be pursued to establish radiation safety standards. These recommendations were ignored then, but Dr. Morgan continues to emphasize the need to develop an understanding of the relationship between biological effects and radiation dosage. Currently, he is Chairman of a National Academy of Sciences Committee reviewing the health research programs of the Department of Energy.

Dr. Morgan's Hopkins career began in 1946 when he was named Professor and Chairman of the Department of Radiology at the Hopkins School of Medicine and the first Radiologist-in-Chief of the Hopkins Hospital. In 1960, he became Professor and Chairman of the Department of Radiologic Science in the School of Hygiene and Public Health. Named Dean of the School of Medicine in 1971, he became Vice President for the health divisions in 1973—posts he held until 1976.

During the Second World War, he became active in the US Public Health Service in methods of planning and evaluating X-ray film

surveys of large populations, particularly in the application of fluorographic techniques to tuberculosis control programs. This led to a long association between Dr. Morgan and the Bureau of Radiological Health of the US Public Health Service, and to his active participation in the design and application of public health measures in radiological health.

His clinical investigations are currently concerned with diagnosis

and care of people suffering from black lung disease and asbestosis.

Born in London, Ont., Dr. Morgan became a naturalized US citizen in 1943. His undergraduate and medical education was at the University of Western Ontario, from which he received his MD degree in 1937. He taught radiology at the University of Chicago for two years, until 1946, when he left to join the Hopkins faculty. Last spring, the Hopkins School of Medicine named

its Department of Radiology and Radiological Science in his honor.

The medal he received in Germany was presented by the German Roentgen Museum Society and is considered one of the highest honors in radiology. The Society commemorates **Wilhelm Konrad Roengen**, who discovered the X-ray in 1895, for which he was awarded the Nobel Prize in Physics. Remscheid, Germany, is Roentgen's birthplace. □

Medical Miscellany

Sen. Mathias says Federal Government is Not Doing Its Job in Promoting Mental Health Research

US Senator Charles McC. Mathias, Jr. (R-MD) says the Federal government "Has played too small a role, with too little flair" in promoting research in mental health and behavioral sciences.

The Maryland Senator made his remarks in an address to the annual meeting of the Mennonite Mental Health Services Association sponsored by the Brook Lane Psychiatric Center in Hagerstown, MD.

"Despite dramatic advances in understanding and in treating mental illness," Sen Mathias said, "the incidence of mental and emotional problems in the United States continues to rise and we still do not have a mental health care system equal to our problems."

According to the Congressional Research Service, more than 20 million Americans suffer from some form of mental illness, but only four million actually receive treatment.

He noted that "Every year for the past 10 years, the Federal financial commitment to mental health research has remained at about the same level, which, in the times of inflation, is bad news. This has just not been enough to meet our needs. But, recently, for the first time in a long time, I feel some faint stirrings of hope," he added. "The Administration seems to be singing snatches of my tune."

"In February, 1979, Mrs. Carter's testimony before the Senate Subcommittee on Health and Scientific Research of the Human Resources Committee gave a needed boost to the recommendations of the President's Commission on Mental Health. Mrs. Carter highlighted the fact that inflation has taken a big bite out of mental health research funds since 1967 and she made an eloquent appeal for the increased funding for mental health research in the Administration's otherwise lean health budget," Mathias explained.

"I welcome the increase in funds for mental health research and I salute Mrs. Carter for the push she is giving to new mental health initiatives, but I think we have to examine these new initiatives in the context of the total budget for mental health to be sure the Administration isn't 'robbing Peter to pay Paul.' For example, while research funds will be increased, training funds will be cut."

"The 95th Congress last year appropriated \$573,633,000 for mental health programs for Fiscal Year '79. The President has recommended \$534,114,000 for FY '80 and a supplemental request of \$4,118,000 for FY '79. This is a net decrease of \$43,637,000 from the FY '79 level.

"I have been fighting for a long time for adequate funding for mental and physical health programs," Maryland's senior Senator said in conclusion. "I intend to do battle again when the Labor-HEW Subcommittee of the Senate Appropriations Committee meets to consider the President's budget proposals." □

Oral Solution
125 and 250 mg*/5 ml

V-Cillin K[®] penicillin V potassium

Description: V-Cillin K is the potassium salt of penicillin V. This chemically improved form combines acid stability with immediate solubility and rapid absorption.

Indications: For the treatment of mild to moderately severe pneumococcal respiratory tract infections and mild staphylococcal skin and soft-tissue infections that are sensitive to penicillin G. See the package literature for other indications.

Contraindication: Previous hypersensitivity to penicillin.

Warnings: Serious, occasionally fatal, anaphylactoid reactions have been reported. Some patients with penicillin hypersensitivity have had severe reactions to a cephalosporin; inquire about penicillin, cephalosporin, or other allergies

before treatment. If an allergic reaction occurs, discontinue the drug and treat with the usual agents (e.g., epinephrine or other pressor amines, antihistamines, or corticosteroids).

Precautions: Use with caution in individuals with histories of significant allergies and/or asthma. Do not rely on oral administration in patients with severe illness, nausea, vomiting, gastric dilatation, cardiospasm, or intestinal hypermotility. Occasional patients will not absorb therapeutic amounts given orally. In streptococcal infections, treat until the organism is eliminated (minimum of ten days). With prolonged use, nonsusceptible organisms, including fungi, may overgrow; treat superinfection appropriately.

Adverse Reactions: Hypersensitivity, including fatal anaphylaxis. Nausea, vomiting, epigastric distress, diarrhea, and black, hairy tongue. Skin eruptions, urticaria, reactions resembling serum sickness (including chills, edema, arthralgia, prostration), laryngeal edema, fever, and eosinophilia. Infrequent hemolytic anemia, leukopenia, thrombocytopenia, neuropathy, and nephropathy, usually with high doses of parenteral penicillin. (102175)

***Equivalent to penicillin V.**

with symptomatic relief of moderate anxiety with depression

Rapid relief of the symptoms of moderate anxiety in many patients

The tranquilizer component alleviates symptoms of anxiety and agitation within a few days, without apparent dulling of mental acuity. Hypnotic effects from the tranquilizer component appear to be minimal, particularly in patients permitted to remain active. However, TRIAVIL may impair mental and/or physical abilities required for the performance of hazardous tasks.

Highly effective antidepressant action

The antidepressant component relieves symptoms of depression such as poor concentration and feelings of hopelessness as well as early morning awakening; adequate relief of symptoms may take a few weeks or even longer.

Increased activity potential often results from symptomatic relief

As the symptoms of anxiety and depression respond to TRIAVIL, many patients may show renewed interest in family and recreational activities and are able to function more effectively at work.

More prescribing convenience

For optimal flexibility there are now *five* tablet strengths of TRIAVIL for ease of dosage adjustment. For initial management of patients with moderate anxiety and depression, one TRIAVIL® 2-25, containing 2 mg perphenazine and 25 mg amitriptyline HCl, t.i.d. may often be adequate. TRIAVIL® 4-50, containing 4 mg perphenazine and 50 mg amitriptyline HCl, provides b.i.d. convenience for those patients needing the larger total daily dose of 8 mg perphenazine and 100 mg amitriptyline HCl as initial or maintenance therapy.

Treatment with TRIAVIL— a balanced view:

TRIAVIL is contraindicated in CNS depression from drugs, in the presence of evidence of bone marrow depression, and in patients hypersensitive to phenothiazines or amitriptyline. It should not be used during the acute recovery phase following myocardial infarction or in patients who have received an MAOI within two weeks. Patients with cardiovascular disorders should be watched closely. Not recommended in children or during pregnancy. TRIAVIL may impair mental and/or physical abilities required for performance of hazardous tasks and may enhance the response to alcohol. Antiemetic effect may obscure toxicity due to overdosage of other drugs or mask other disorders. The possibility of suicide in depressed patients remains until significant remission occurs. Such patients should not have access to large quantities of the drug. Hospitalize as soon as possible any patient suspected of having taken an overdose.

More dosage strengths
than any other formulation containing
a tranquilizer and an antidepressant

Dual-action Triavil®

containing perphenazine and amitriptyline HCl

Available:

TRIAVIL® 2-25: Each tablet contains
2 mg perphenazine and 25 mg amitriptyline HCl.
TRIAVIL® 2-10: Each tablet contains
2 mg perphenazine and 10 mg amitriptyline HCl.
TRIAVIL® 4-50: Each tablet contains
4 mg perphenazine and 50 mg amitriptyline HCl.
TRIAVIL® 4-25: Each tablet contains
4 mg perphenazine and 25 mg amitriptyline HCl.
TRIAVIL® 4-10: Each tablet contains
4 mg perphenazine and 10 mg amitriptyline HCl.

CONTRAINDICATIONS: Central nervous system depression from drugs (barbiturates, alcohol, narcotics, analgesics, antihistamines); evidence of bone marrow depression; known hypersensitivity to phenothiazines or amitriptyline. Should not be given concomitantly with a monoamine oxidase inhibitor since hyperpyretic crises, severe convulsions, and deaths have occurred from such combinations. When used to replace a monoamine oxidase inhibitor, allow a minimum of 14 days to elapse before initiating therapy with TRIAVIL. Therapy should then be initiated cautiously with gradual increase in dosage until optimum response is achieved. Not recommended for use during acute recovery phase following myocardial infarction.

WARNINGS: TRIAVIL should not be given concomitantly with guanethidine or similarly acting compounds since TRIAVIL may block the antihypertensive action of such compounds. Use cautiously in patients with history of urinary retention, angle-closure glaucoma, increased intraocular pressure, or convulsive disorders. Dosage of anticonvulsive agents may have to be increased. In patients with angle-closure glaucoma, even average doses may precipitate an attack. Patients with cardiovascular disorders should be watched closely. Tricyclic antidepressants, including amitriptyline HCl, have been reported to produce arrhythmias, sinus tachycardia, and prolongation of conduction time, particularly in high doses. Myocardial infarction and stroke have been reported with tricyclic antidepressant drugs. Close supervision is required for hyperthyroid patients or those receiving thyroid medication. May impair mental and/or physical abilities required for performance of hazardous tasks, such as operating machinery or driving a motor vehicle. In patients who use alcohol excessively, potentiation may increase the danger inherent in any suicide attempt or overdosage. Not recommended in children or during pregnancy.

PRECAUTIONS: Suicide is a possibility in depressed patients and may remain until significant remission occurs. Such patients should not have access to large quantities of this drug.

Perphenazine: Should not be used indiscriminately. Use with caution in patients who have previously exhibited severe adverse reactions to other phenothiazines. Likelihood of some untoward actions is greater with high doses. Closely supervise with any dosage. The antiemetic effect of perphenazine may obscure signs of toxicity due to overdosage of other drugs or make more difficult the diagnosis of disorders such as brain tumor or intestinal obstruction. A significant, not otherwise explained, rise in body temperature may suggest individual intolerance to perphenazine, in which case discontinue.

If hypotension develops, epinephrine should not be employed, as its action is blocked and partially reversed by perphenazine. Phenothiazines may potentiate the action of central nervous system depressants (opiates, analgesics, antihistamines, barbiturates, alcohol) and atropine. In concurrent therapy with any of these, TRIAVIL should be given in reduced dosage. May also potentiate the action of heat and phosphorous insecticides. There is sufficient experimental evidence to conclude that chronic administration of antipsychotic drugs which increase prolactin secretion has the potential to induce mammary neoplasms in rodents under the appropriate conditions. There are recognized differences in the physiological role of prolactin between rodents and humans. Since there are, at present, no adequate epidemiological studies, the relevance to human mammary cancer risk from prolonged exposure to perphenazine and other antipsychotic drugs is not known.

Amitriptyline: In manic-depressive psychosis, depressed patients may experience a shift toward the manic phase if they are treated with an antidepressant. Patients with paranoid symptomatology may have an exaggeration of such symptoms. The tranquilizing effect of TRIAVIL seems to reduce the likelihood of this effect. When amitriptyline HCl is given with anticholinergic agents or sympathomimetic drugs, including epinephrine combined with local anesthetics, close supervision and careful adjustment of dosages are required. Paralytic ileus may occur in patients taking tricyclic antidepressants in combination with anticholinergic-type drugs.

Caution is advised if patients receive large doses of ethchlorvynol concurrently. Transient delirium has been reported in patients who were treated with 1 g of ethchlorvynol and 75-150 mg of amitriptyline HCl.

Amitriptyline HCl may enhance the response to alcohol and the effects of barbiturates and other CNS depressants.

Concurrent administration of amitriptyline HCl and electroshock therapy may increase the hazards associated with such therapy. Such treatment should be limited to patients for whom it is essential. Discontinue several days before elective surgery if possible. Elevation and lowering of blood sugar levels have both been reported. Use with caution in patients with impaired liver function.

ADVERSE REACTIONS: Similar to those reported with either constituent alone. **Perphenazine:** Extrapyramidal symptoms (opisthotonus, oculogyric crisis, hyperreflexia, dystonia, akathisia, acute dyskinesia, ataxia, parkinsonism) have been reported and can usually be controlled by the concomitant use of effective antiparkinsonian drugs and/or by reduction in dosage, but sometimes persist after discontinuation of the phenothiazine.

Tardive dyskinesia may appear in some patients on long-term therapy or may occur after drug therapy with phenothiazines and related agents has been discontinued. The risk appears to be greater in elderly patients on high-dose therapy, especially females. Symptoms are persistent and in some patients appear to be irreversible. The syndrome is characterized by rhythmical involuntary movements of the tongue, face, mouth, or jaw. Involuntary movements of the extremities sometimes occur. There is no known treatment for tardive dyskinesia; antiparkinsonism agents usually do not alleviate the symptoms. It is advised that all antipsychotic agents be discontinued if the above symptoms appear. If treatment is reinstituted, or dosage of the particular drug increased, or another drug substituted, the syndrome may be masked. Fine vermicular movements of the tongue may be an early sign of the syndrome. The full-blown syndrome may not develop if medication is stopped when lingual vermiculation appears.

Other side effects are skin disorders (photosensitivity, itching, erythema, urticaria, eczema, up to exfoliative dermatitis); other allergic reactions (asthma, laryngeal edema, angioneurotic edema, anaphylactoid reactions); peripheral edema; reversed epinephrine effect; hyperglycemia; endocrine disturbances (lactation, galactorrhea, gynecomastia, disturbances of menstrual cycle); altered cerebrospinal fluid proteins; paradoxical excitement; hypertension, hypotension, tachycardia, and ECG abnormalities (quinidine-like effect); reactivation of psychotic processes; catatonic-like states; autonomic reactions, such as dry mouth or salivation, headache, anorexia, nausea, vomiting, constipation, obstipation, urinary frequency or incontinence, blurred vision, nasal congestion, and a change in pulse rate; other adverse reactions reported with various phenothiazine compounds, but not with perphenazine, include grand mal convulsions, cerebral edema, polyphagia, pigmentary retinopathy, photophobia, skin pigmentation, and failure of ejaculation.

The phenothiazine compounds have produced blood dyscrasias (pancytopenia, thrombocytopenic purpura, leukopenia, agranulocytosis, eosinophilia); and liver damage (jaundice, biliary stasis).

Pigmentation of the cornea and lens has been reported to occur after long-term administration of some phenothiazines. Although it has not been reported in patients receiving TRIAVIL, the possibility that it might occur should be considered.

Hypnotic effects, lassitude, muscle weakness, and mild insomnia have also been reported.

Amitriptyline: Note: Listing includes a few reactions not reported for this drug, but which have occurred with other pharmacologically similar tricyclic antidepressant drugs and must be considered when amitriptyline is administered. **Cardiovascular:** Hypotension; hypertension; tachycardia; palpitation; myocardial infarction; arrhythmias; heart block; stroke. **CNS and Neuromuscular:** Confusional states; disturbed concentration; disorientation; delusions; hallucinations; excitement; anxiety; restlessness; insomnia; nightmares; numbness, tingling, and paresthesias of the extremities; peripheral neuropathy; incoordination; ataxia; tremors; seizures; alteration in EEG patterns; extrapyramidal symptoms; tinnitus; syndrome of inappropriate ADH (antidiuretic hormone) secretion. **Anticholinergic:** Dry mouth; blurred vision; disturbance of accommodation; increased intraocular pressure; constipation; paralytic ileus; urinary retention; dilatation of urinary tract. **Allergic:** Skin rash; urticaria; photosensitization; edema of face and tongue. **Hematologic:** Bone marrow depression including agranulocytosis; leukopenia; eosinophilia; purpura; thrombocytopenia. **Gastrointestinal:** Nausea; epigastric distress; vomiting; anorexia; stomatitis; peculiar taste; diarrhea; parotid swelling; black tongue. Rarely hepatitis (including altered liver function and jaundice). **Endocrine:** Testicular swelling and gynecomastia in the male; breast enlargement and galactorrhea in the female; increased or decreased libido; elevated or lowered blood sugar levels. **Other:** Dizziness, weakness; fatigue; headache; weight gain or loss; increased perspiration; urinary frequency; mydriasis; drowsiness; alopecia. **Withdrawal Symptoms:** Abrupt cessation after prolonged administration may produce nausea, headache, and malaise. These are not indicative of addiction.

OVERDOSAGE: All patients suspected of having taken an overdosage should be admitted to a hospital as soon as possible. Treatment is symptomatic and supportive. However, the intravenous administration of 1-3 mg of physostigmine salicylate is reported to reverse the symptoms of tricyclic antidepressant poisoning. Because physostigmine is rapidly metabolized, the dosage of physostigmine should be repeated as required particularly if life-threatening signs such as arrhythmias, convulsions, and deep coma recur or persist after the initial dosage of physostigmine. On this basis, in severe overdosage with perphenazine-amitriptyline combinations, symptomatic treatment of central anticholinergic effects with physostigmine salicylate should be considered.

Information for Authors

MED-CHI MEMBERS reading papers before Faculty or other organizations are invited to submit their papers to the **JOURNAL** for consideration by the Editorial Board for publication.

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published and are contributed solely to the *Maryland State Medical Journal*. An abstract or summary, limited to 200 words, should be included.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the *Journal* and are not returned. The *Journal* is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to Editor, *Maryland State Medical Journal*, 1211 Cathedral St, Baltimore MD 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (including text, case reports, legends, tables and references) with margins of at least one inch. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations and any institutional or other credits. Please include a complete address where the author may receive proofs for approval and corrections.

The author should retain another copy of the manuscript for his/her records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title and its position in the text should be indicated. The Editor reserves the right to edit the tables. Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text. A complete review of the literature is rarely desirable. References must be typed doublespaced and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article and date. Complete dates (month, day and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition,

location, publisher year, volume (if given) and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book) and the title of the chapter, if any. References should be listed consecutively, both in text and listing.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black and white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Please do not deface an illustration by writing on the front or back UNLESS it is done lightly with a grease pencil or so lightly that the imprint will not register through to the front. The figure number and author's name will suffice.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings. The Editor reserves the right to limit the number of photographs used.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with *Journal* style.

A set of galley proofs will be provided the principal author and, if not returned by the specified date, will be considered approved as type-set.

Statements made or opinions expressed by any contributor in any article or feature published in the *Journal* are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the *Maryland State Medical Journal*, is protected by copyright and may not be reproduced without the written permission of both the author and the *Journal*. □

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

Labor and Delivery of a Viable County Auxiliary

As most people know, human gestation takes 40 weeks, however, the gestation period of a county auxiliary is more like that of an elephant and just about as difficult.

Conception took place on March 5, 1977, when I was approached by some of the wives about starting a county auxiliary. Helen Boyer and Carol Broadus met with Irene Banerjee, Fatima Haziq, Nancy Howell and Marlene Kassem in the latter part of April. At that time, they explained the workings of the Auxiliary to Med-Chi and the relationships between the component auxiliaries, the state and the AMA Auxiliary. We were given a sample copy of bylaws that could be adapted for our group as well as a sheet titled, *Organizing a New Auxiliary*. Carol and Helen told us that before forming, we had to get permission from the county medical society. They also gave us a tremendous amount of moral support and encouragement.

Within the next month, we wrote to Dr. Chinmay Banerjee, who was then the President of the Charles County Medical Society, requesting permission to form the Auxiliary. On Aug. 4, 1977, we received a letter congratulating us and pledging the support of the Society.

Our first meeting was held on Oct. 13th with 12 people present. We got pledges of support and it appeared that we had viability; however, we had a threatened abortion at the next meeting on Nov. 8th when only five people showed up. At that time, we decided to suspend meeting until a questionnaire had been sent out to see who was interested and in what areas. We also asked for opinions on when to meet and if they were not interested, why? These were sent out in December, 1977 and only two people responded. Needless to say, we were quite discouraged. Two of us worked over the next few months attending the Winter Board Meeting, the Annual Meeting (with a total of four paid members), and making innumerable phone calls.

After the Annual Meeting, armed with encouragement and a resolve to change things, we had a meeting on May 18th. That meeting produced three stubborn, tenacious people; Jean Dettor, Nancy Howell and Marlene Kassem. We continued to have meetings throughout the summer of '78 planning a course of action for the coming Fall. We also decided to involve ourselves in a project, preferably civic, that would give us exposure in the local papers. Marlene and Nancy took the Basic CPR Course followed 10 days later by the CPR Instructors Course. We did this with the help of the Greater Waldorf Jaycees since we did not have the funds or manpower to do it on our own. (The Jaycees are an excellent group with which to align

your auxiliary. They are very interested in the health care areas, and, with their manpower, small groups have a very good resource base.) Jean saw to the publicity and we started getting calls for classes. We raised \$233 from September, 1978-April, 1979.

In September, 1978, we had a brunch at Jean Dettor's with nine people present. Viable again! We discussed IPAs HMOs, national health, CPR, the Christmas cards and showed our new stationery. Our membership drive seemed successful. Some of us had attended the Semiannual Convention and got ideas and encouragement again from other auxiliaries.

October, however, brought another threatened abortion. The total attendance was two with regrets from one—that's right, the summer trio. We took that meeting time for writing reports and planning. (We also consoled each other quite a bit. Our spirits were really low.) One of the reports went to the medical society, given by Dr. Howell, as the auxiliary had never been invited to attend or address a society meeting. We mentioned the CPR courses and the Christmas cards, hoping to make sales to the physicians. We made two. We again decided to dispense with meetings until January, 1979. Even though discouraged and angry, our tenacity prevailed.

At the medical society's Annual Christmas Party in December, we were asked to speak. I'll never remember what I said since I was in shock over having the Auxiliary recognized, but at the end of the evening, the wife of the society's new President, Noida Joson, came over to ask about the next meeting. Dr. Joson extended an invitation to the Auxiliary President to attend the Society meetings. Viability reigns!

Our January, 1979 meeting had five people present with regrets from two. Dues were paid by four. We made plans for a membership luncheon in March, plans for Doctors' Day, and a theatre party and two of us decided to go to the Winter Board Meeting complete with sample drugs and medical magazines.

February was almost snowed out, but four stalwart members still showed.

March gave us our membership meeting with 10 DUES-PAYING MEMBERS! (We picked up another a few days later for a total of 11.) We planned a family picnic for June since many physicians don't have much time to spend with their families and most all social functions are geared for adults. We felt this was a good way for our group to show its interest in the family. Also that month, we participated, along with the medical society, in the Jaycees' Health Fair. (Next year, this group plans on having a physician and an auxilian on the Health Fair Committee.) Each auxilian gave her husband a red carnation to wear for Doctors'

Day and we further celebrated at a production of *Oklahoma* at the local playhouse.

April saw us finalizing plans for the picnic, discussing legislation, and displaying our centerpieces for the Square Dance to be held at the Annual Convention. We also decided to increase our visability by raffling off a mini-garden at the Square Dance.

Our dreams came true when, on May 4, 1979, we were delivered, at the Convention, a certificate from the State Auxiliary for membership—a 175% increase over the previous year! Our conception, threatened abortions and prolonged, dystocic labor produced the birth of a viable component auxiliary. Now that the delivery is completed, we look forward to the growth and success of our offspring.

While our account may seem like the process was easy, it took many months of a few people working laboriously, making innumerable phone calls, meeting disappointment after disappointment, hurt feelings and much blood, sweat and tears before we succeeded.

Every last ounce of ourselves, or so it seemed at times, that we gave was worth it. It takes hard work and there are no magic formulas to make it any easier. There were times when our spirits faltered, but with the encouragement of the state Auxiliary and members from other county auxiliaries, we met at the different functions, our spirits were renewed and we plunged back in. We took every suggestion, because we didn't know what else to do. Somehow, through all those efforts, questionnaires, phone calls and tears, we made it.

To anyone contemplating the "birth of an auxiliary"—take heart, for the fruits of your labor are worth all the pains. None of us involved in this venture would have ever thought of backing out. It became our cause and our sacrifice for the medical profession. Like a mother's sacrifice for her child, so were our sacrifices to produce a county auxiliary.

forded by nothing more than a full head of hair. Current helmet-facemask systems provide an extraordinary degree of protection to the head and face, he declares.

"As a result, coaches have developed playing techniques that use the head and helmet as a battering ram in blocking, tackling and butting. Such techniques fail to account for the potential danger of injury to the cervical spine when the head is the primary point of contact in a high-impact situation."

In the five-year period of 1959-63, during which time 820,000

Medical Miscellany

New Helmets Blamed for Increase in Broken Necks in Football Players

Deaths from organized football have declined in recent years, but there has been a marked increase in broken necks resulting in complete paralysis.

The protective helmet-facemask system has effectively-protected the head, and, by so doing, has allowed it to be used as a battering ram in tackling and blocking, thus causing more broken necks.

This is the finding of a study by the National Football Head and Neck Injury Registry, published recently in the *Journal of the AMA (JAMA)*.

The Registry has documented 1,129 serious football injuries, mostly among high school and college players, since 1971. Of these, 550 were broken necks, of which 176 resulted in permanent paralysis from the neck down, says Joseph S. Torg, MD, of the University of Pennsylvania Sports Medicine Center, which handled the tabulation.

During the last 20 years there, has been a decrease in fatal injuries and in serious brain injuries, Dr. Torg declared.

Despite the contact nature of tackle football, the fatality and catastrophic injury rates have remained low, he points out. There are relatively-few serious injuries in relation to the total number of players involved during a given season.

Evolution of protective coverings for the head has occurred during the past 70 years. As recently as 1905, protection was af-

youth played football each year, there were 86 deaths as a direct result of football, the Registry found. During the five-year period of 1971-75, with 1,275,000 players in the games each year, 77 deaths occurred. The deaths had been primarily from head injuries, and the modern helmets reduced the risk of death considerably.

Among high schoolers paralyzed from broken necks, 78% of the injuries occurred when making tackles. At the college level, 73% of those paralyzed by neck injuries were defensive backs, Dr. Torg says.

"On the basis of observations and data offered by our study, we firmly believe that the increase in verified cervical spine injuries and permanent paralysis is due to the implementation of playing techniques that use the top or crown of the helmet as the primary point of contact in a high-impact situation."

The Registry was established in Philadelphia by the National Athletic Trainers Association and the Sports Medicine Center of the University of Pennsylvania. □

*Indicates primary Commission action. In some cases, the primary action is associated with a stay of that action; all such cases also have probation with conditions. See detail below.

Revocation:
Emmett Davis, MD—Professional incom-

petence; violation of conditions of probation resulting from prior revocation with stay.

Karl Namvary, MD—Conviction of a crime involving moral turpitude; stay of revocation, probation with conditions.

Harvey Barry Jacobs, MD—Conviction of a crime involving moral turpitude.

Edward E. Holt, MD—Professional incompetence.

Mohammad Baloch, MD—Professional incompetence; stay of revocation, probation with conditions.

Suspension:

Coral Gordon, MD—Professional incompetence; stay of suspension, probation with conditions.

Probation:

Magin Quiambao, MD—Professional incompetence; conditions.

Martin Buell, MD—Professional and mental incompetence; conditions.

Reprimand:

Lewis B. Newberg, MD—Professional incompetence; probation with conditions.

Anselmo Alliegro, MD—Professional incompetence; probation with conditions.

Artemio Arciaga, MD—Professional incompetence; probation with conditions.

Leonard Flax, MD—Professional incompetence probation with conditions.

Augustin Dordal, MD—Professional incompetence; probation with conditions.

Emergency Suspension (temporary):

Leonard Flax, MD, Martin Buell, MD

Cases Terminated by Death:

Russell Morris, MD, Marvin Saiontz, MD

Denial of Reinstatement:

Emmett Davis, MD

Reinstatement:

Paul Schonfeld, MD, Shim Eung Kim, MD (with probation)

Legislation of Interest to Commission, 1978-79

1. HB 1375 and SB 961—Consumer Representation—In Summer Session

2. HB 741—Identification of Physician Specialists—passed, vetoed by Governor

3. HB 170—Discipline of Physician assistants—withdrawn

4. HB 425—Special Funding, Board of Medical Examiners—In Summer Session

Court Decisions of Interest to Commission—1978-79

1. The Court of Appeals upheld Circuit Court of Special Appeals decisions in favor of enforcement of certain Commission subpoenas.

2. A Commission declaratory ruling on physicians directories was upheld on appeal to the Court of Special Appeals. The Court of Special Appeals decisions in favor and motions for summary judgment to a Federal Court were remanded to the attorneys involved.

Librium®

chlordiazepoxide HCl/Roche

- ☐ Proven antianxiety performance
- ☐ An unsurpassed safety record
- ☐ Predictable patient response
- ☐ Minimal effect on mental acuity at recommended doses
- ☐ Minimal interference with many primary medications, such as antacids, anticholinergics, diuretics, cardiac glycosides and antihypertensive agents

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of anxiety and tension occurring alone or accompanying various disease states. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children under six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and

acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. Oral—Adults: Mild and moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl) Capsules, 5 mg, 10 mg and 25 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in trays of 4 reverse-numbered boxes of 25, and in boxes containing 10 strips of 10; Prescription Paks of 50, available singly and in trays of 10. Libritabs® (chlordiazepoxide) Tablets, 5 mg, 10 mg and 25 mg—bottles of 100 and 500. With respect to clinical activity, capsules and tablets are indistinguishable.

A character all its own.

Valium (diazepam/Roche) is a benzodiazepine with a character all its own.

Pharmacologically, it is a potent skeletal muscle relaxant and anticonvulsant (in adjunctive use), as well as an antianxiety agent. Pharmacokinetically, only Valium provides active *diazepam* as well as the active metabolites 3-hydroxydiazepam, desmethyldiazepam and oxazepam.

But the individual character of Valium is even more apparent clinically than pharmacokinetically. And far more significant. That's because of the patient response obtained with Valium. A response which brings a calmer frame of mind. A response which has a pronounced effect on the somatic symptoms of anxiety, particularly muscular tension. A response which helps the patient feel more like himself again because of the way Valium reduces the overwhelming symptoms of anxiety and psychic tension.

Another important aspect of the clinical character of Valium is safety. Though drowsiness, ataxia and fatigue are possible, these and more serious side effects are rarely a problem. Of course, as with all CNS-acting drugs, patients taking Valium should be cautioned against driving, operating dangerous machinery or the simultaneous ingestion of alcohol.

Unquestionably, many psychotherapeutic agents, including other benzodiazepines, have antianxiety effects. But one fact remains: you get a certain kind of patient response with Valium. It's a response you want. A response you know. A response you trust as part of your overall management of anxiety and psychic tension.

Valium®^{IV} diazepam/Roche

2-mg, 5-mg, 10-mg scored tablets
a prudent choice in psychic
tension and anxiety

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology; spasticity caused by upper motor neuron disorders; athetosis; stiff-man syndrome; convulsive disorders (not for sole therapy).

The effectiveness of Valium (diazepam/Roche) in long-term use, that is, more than 4 months, has not been assessed by systematic clinical studies. The physician should periodically reassess the usefulness of the drug for the individual patient.

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in trays of 4 reverse-numbered boxes of 25, and in boxes containing 10 strips of 10; Prescription Paks of 50, available singly and in trays of 10.

If you are the trustee of your own Pension or Profit-Sharing Plan you could be making a mistake.

The Pension Reform Act makes trustees personally liable for acts in violation of this statute. A trustee, for example, can be sued for mistakes in plan administration or for errors of judgment in investment management.

Let's face it. Physicians normally are simply too busy being physicians to devote the proper amount of time to their retirement plans. Congress obviously knew this, because one of the major purposes of the Pension Reform Act was to make the management of Pension and Profit-Sharing Plans the responsibility of competent professionals.

First National serves as trustee for a variety of retirement plans, including those of incorporated physicians.

So we ask: from one professional to another, doesn't it make good sense to let a professional perform what he does best?

Call Mr. James Neal at (301) 244-4607, for details.

Heart Attack! A Challenge to the JOURNAL

Two articles recently printed in the *Journal of the American Medical Association* (JAMA) dealt with the first response to severe chest pain. In the Aug. 4, 1978 issue of JAMA, an editorial read as follows:

"Ask a sedentary American who is well into middle-age whether he has any growing fears regarding his health and he will probably tell you he worries about having a heart attack."

Yet the average American's first response to severe chest pain is to try to come up with reasons why it can't be anything serious. Anxiety and defense response (such as intellectualization, rationalization, displacement and denial) are responsible for many patients' delays in seeking medical attention. Since most deaths occur within the first two hours after the onset of symptoms, this delay can be fatal.

According to Thomas P. Hackett, MD, Chief of Psychiatry at Massachusetts General Hospital, this anxious response occurs regardless of the patient's level of sophistication or education. At the American Psychiatry meeting, Dr. Hackett reported the results of studies of anxiety in Myocardial infarction. Several cardiologists were subjects in the study" and even they usually deny the significance of their chest pain" and they too waited before contacting another physician and/or going to the Emergency Room, reported Dr. Hackett.

Hence, the question arises how can Health Professionals get the public to reduce delay time? Dr. Hackett said that the answer is to *Frankly publicize the fact that a typical first response to chest pain is the denial that it may be a heart attack.* As an example, many people take antacids in an effort to see if the pain is indigestion and wait to see if it will go away. What is equally as important is continual reassurance that thousands of people return to fulfilling lives after myocardial infarction. The ideal behavior when experiencing severe chest pain would be to go to the hospital immediately, most people, however, do not. Usually they wait a few hours until their anxiety, and not the pain, has built to an intolerable level, and at that point they seek prompt medical attention. Dr. Hackett additionally noted that having a heart attack in the presence of an "Executive spouse" that is, someone who will call an ambulance immediately after the patient complains of chest pain "without asking if the patient wants this done" is the next best thing to the patient himself/herself actually seeking medical help.

A second article in JAMA, published Aug. 25, 1978, presented the results of a poll taken regarding public belief of the cause and prevention of heart attacks. "Our survey has shown a continuing extensive lack of information in the general adult population about the problems causing Coronary Artery Disease." The poll indicated that 41% of college graduates did not name any of the three major risk factors, and that only one percent named all three." Moreover, although three-quarters of the respondents believe that heart attack can be prevented in persons younger than 60 years of age, few could name specific behaviors, (except for stopping cigarette smoking) that would effectively reduce the risk factors.

A criticism sometimes leveled at public educational efforts is that while they may change knowledge, *such programs do not change behavior.* This is, however, not necessarily true; in fact, programs directed at whole communities through the mass media may be effective in reducing the prevalence of risk factors for cardiovascular disease.

Both of these articles highlight the problems about heart attack and shed light on the reasons why 600,000 people die each year from this dreaded disease. The reasons as indicated in these articles are 1) Lack of information 2) Defense mechanisms employed by the patient that lead to procrastination and denial and 3) The need for an "Executive spouse" or knowledgeable member of the family who can take charge. The public has a right to be kept informed regarding the latest information in the field of Coronary Artery Disease. The mass media has an obligation to offer to communities the opportunity to gain knowledge in The Early Warning Signs and the simple techniques of Cardiopulmonary Resuscitation and let's hope that such programs do, in fact, change behavior. Such awareness will then, hopefully, lead to prevention of heart attack. Knowledge regarding the three big risk factors, namely, hypertension, cigarette smoking and a high cholesterol level is imperative. The importance of physical fitness and the benefits of exercise programs is also an important consideration in dealing with myocardial infarction and recovery.

Armed with this information I challenge you to provide the readers of your fine paper with some Life-Saving Information, And I pray that our joint endeavor will serve to save lives and create a healthier lifestyle.

THE LEADING NATIONAL BRAND OF GENERICS

George V. Eltgroth is a Patent Attorney for General Electric. He is legally blind.

George Eltgroth's official title is Counsel for Patent Strategy and Utilization. His work for the International Division of GE involves finding people who infringe on GE patents and handling cross-licensing agreements between major corporations.

Eltgroth is 62. When he was 33, he contracted polio. It took him two years before he was able to walk with a cane. At 41 his vision dropped below the level of legal blindness. But, as Eltgroth points out, "There wasn't anyone who was going to look after me. I had four small children. I had to continue my career." In 1964, Eltgroth negotiated one quarter of GE's acquisition of Compagnie des Machines Bulle from Olivetti. He was put in

charge of patent operations in Phoenix, Milan, and Paris. "I had 20 French lawyers working for me," says Eltgroth, "only two of whom spoke English. So I learned French, not from books, but by ear." Eltgroth is also fluent in German and is able to work in Spanish as well.

"Handling forms is hard for me," says Eltgroth. "I have only peripheral vision about 1 or 2 percent of normal. I read slowly, so I have to do a lot of preparatory work for patent negotiations. My handwriting is weak, so I type. I have physical problems, but by developing my abilities in law and technology, I'm able to make the balance come out positive. I've wrapped up negotiations that would have taken most non-handicapped people five years

in two. When you're handicapped, you've got to test your limits. As a result of my polio, falling is dangerous—ice and snow are a problem. So I put screws in the bottom of my galoshes. When I had crutches, I put hooks on them for my briefcase. You shouldn't dwell on what's lost, but on what you have left."

CHARLES R. BUCK, JR., ScD, Secretary

The Future of Psychiatric Leadership in Maryland's Mental Hygiene Programs?

By GARY W. NYMAN, MD with the Hon. State Sen. ROSALIE S. ABRAMS,
JOHN HAMILTON, MD; STANLEY PLATMAN, MD and CHESTER SCHMIDT, MD

For reprint and other data, contact Dr. Nyman, Director of the Mental Hygiene Administration of the State Department of Health and Mental Hygiene, 201 W. Preston St., Balto., MD 21201.

Introduction

During the last 10 years, Maryland has experienced transient leadership in its Mental Hygiene Administration. Many factors contributed to the inability to attract and keep competent psychiatric leadership in the public sector. This inconsistent and transient leadership had focused increasing concern among psychiatrists in Maryland's private and university sectors about the direction within Mental Hygiene in Maryland. With explicit encouragement and support from psychiatrists in the private and university sectors, a local, academically-oriented, young, clinical psychiatrist accepted the senior mental hygiene professional job in 1976.

In the first year of rebuilding, it became apparent that most psychiatric resources in Maryland were within the private and university sectors. Despite some support and interest, most psychiatrists within the Maryland Psychiatric Society, and within the Johns Hopkins University and the University of Maryland, had only a peripheral awareness of and involvement in psychiatric care in the public sector. During this year, repeated requests were made by many of these psychiatrists for a greater understanding of and involvement in the public sector psychiatry. This interest crystallized the Maryland Psychiatric Society Program Committee's approach to Mental Hygiene leadership for collaboration in preparing the program for the 1976 Maryland Psychiatric Society dinner/presentation.

Discussion evolved over the summer of 1976 as the program took shape. A brief presentation of the issues surrounding psychiatrists' involvement and psychiatric treatment in the public sector by the Director of Mental Hygiene was planned after dinner. It was to be followed with a panel discussion involving a State Senator, a senior public psychiatric administrator, a senior psychiatric hospital administrator and clinician and a senior academic hospital psychiatrist and private practitioner. Ample time for audience commentary and discussion was allotted in the program, as advanced dinner reservations indicated a large audience planning to attend.

What follows is a presentation of the paper, the panel discussion and the audience commentary as it reflects the interest and direction of the interface between public and private/university sector psychiatry in Maryland.

Presentation by Dr. Gary W. Nyman

(Director, Mental Hygiene Administration and Assistant Professor of Psychiatry—Part-time—at The Johns Hopkins University and Clinical Assistant Professor of Psychiatry at The University of Maryland.)

Historically, the discipline of psychiatry provided the essential leadership within the Mental Hygiene System in Maryland. The mentally-ill, the mentally-retarded, the elderly, the poor and

the chronically-infirm were housed together within large State hospitals: Eastern Shore, Crownsville, Spring Grove and Springfield. For many of these patients, treatment was neither available nor feasible and the hospitals assumed the role of custodial care providers. Psychiatrists assumed the responsibility for the care of their patients in their work as Superintendents, Clinical Directors, Division Chiefs, Unit Directors and attending physicians. With increases in resources and treatment alternatives, psychiatry has continued to lead the treatment team in mental hygiene as it focuses on improving the care that patients within State programs receive.

In general, psychiatry in the university and private sectors developed independently from Maryland's State psychiatric programs. Three outstanding training programs at the Johns Hopkins University, the Sheppard and Enoch Pratt Hospital and the University of Maryland Institute for Psychiatry and Human Behavior continue to develop psychiatric expertise within the state. The proximity of two psychoanalytic institutes and the National Institutes of Mental Health has added to the richness of the Maryland psychiatric community. An increasing number of psychiatric beds at hospitals like Peninsula General, Franklin Square, North Charles, Sacred Heart and St. Joseph's have added to the private psychiatric hospital bed space at Brook Lane, Chestnut Lodge, Gundry and Taylor Manor. The non-public psychiatric resources in Maryland continue to grow, consistent with the increasing awareness of a need for this kind of patient care within Maryland and across the country.

During the last decade, the psychiatric community in Maryland (and the United States) has found itself under greater pressures and increasing scrutiny. Many of these pressures have come from organizations *outside* the psychiatric profession. Regional health system agencies and the State Health Planning and Development Agency now review the number of psychiatric beds proposed. The Health Services Cost Review Commission now reviews the charges for inpatient care. Third-party reimbursers now review all psychiatric treatments and make explicit what they will and will not pay for. Non-medical professional organizations have made the competence of other mental health professionals both public and acceptable as adjuncts and/or alternatives to many types of psychiatric treatments. Federal legislation has passed to limit the number of Foreign Medical Graduates in this country and effectively decrease future psychiatric resources for the entire country, especially in the public sector, and our society as a whole has become more psychologically aware, with increasing curiosity and demands on the psychiatric profession for answers to mental health.

Some very intense pressures have come from *within* the psychiatric profession as psychiatrists increasingly reexamine their roles and functions. One major pressure has come from the conflict of psychiatry as either a social or a medical profession. The psychoanalytic and community mental health movements have both served to pull many psychiatrists beyond the medical model to a greater awareness of the patient as a person with interpersonal, family, social and environmental struggles. Technological and pharmacological advances have simultaneously expanded the

medical role of a psychiatrist as a physician caring for the psychiatrically-ill. The pressure on psychiatrists to respond to both ends of the continuum is intense in Maryland. The realization that the three psychiatric training institutions span the entire biophysiological-social spectrum despite their geographical proximity (all within eight miles of each other) is one example of this unresolved, ongoing conflict.

The pressures on psychiatry in the public sector in Maryland are no fewer than in the private and university sectors. Issues of leadership, role and treatment have all been raised and are being intensively struggled with at the present time.

Psychiatric leadership has and is clearly being challenged within Mental Hygiene in the State of Maryland. State laws and regulations have been changed to explicitly dictate the appropriateness and inappropriateness of specific psychiatric treatments. The legal profession has increasingly infringed upon clinical decision-making. Mental Hygiene has been merged with Health into the Department of Health and Mental Hygiene. The benefits of rejoining psychiatry and health in the public sector have cost mental hygiene its autonomy. Psychiatrists and physicians are no longer required to be Secretary of Health and Mental Hygiene, Assistant Secretary for Mental Health and Addictions, Deputy Director of Mental Hygiene, Assistant Directors of Mental Hygiene or Superintendents, Division Directors and Unit Directors for our psychiatric programs. In an era of malpractice conflicts, State psychiatrists and physicians remain without malpractice coverage, an omission of puzzling implications.

The uncertainty about psychiatrists' leadership and role are greatest in Maryland's community mental health programs. Our more than 60 community mental health programs are almost all under operational responsibility of local health departments. The overwhelming majority of these programs are under the leadership of non-medical mental health professionals: psychologists, psychiatric social workers and administrators. The role of the psychiatrist in many of these programs is often less than one-half time as a diagnostic or therapeutic supervisor. It is often reduced to brief psychiatric consultation for medication of patients in aftercare programs. Diagnostic and therapeutic skills often go underutilized for a variety of logistical, philosophical, cultural and/or economical reasons.

The situation in our public psychiatric hospitals has no fewer stresses for psychiatrists. The recognition of differing patient populations and their differing treatment needs has completely shaken the administrative and treatment structure of these facilities. Rosewood has become a facility for the mentally-retarded, with no administrative or treatment ties to Mental Hygiene. Tawes and Bland-Bryant, two buildings on the Spring Grove campus, have become licensed as nursing homes and are no longer part of Mental Hygiene programming and administration. The Alcoholism Units within each psychiatric hospital are being re-focused to prepare for their possible separation from Mental Hygiene. One-day census data highlights that less than half of these State hospital psychiatric patients are really in need of inpatient psychiatric care, a fact that is consistent with reports across the country; yet, where else can they go? Administratively, a multi-purpose facility concept has been proposed to replace the Superintendent-State Hospital model. It is being utilized at the Walter P. Carter Center and the Thomas B. Finan Center. It allows for administrative and non-psychiatric patient care responsibility under non-psychiatric leadership. The resulting lines of authority and responsibility are much more complex and uncertain, with sharing of previously psychiatric leadership with non-psychiatrically trained personnel. The aim is to provide better psychiatric care to the fewer "psychiatric" patients, better non-psychiatric care to the non-psychiatric patients and better support services in areas of administrative services. *Will it work?* Will psychiatric leadership continue in the face of decreased authority for non-psychiatric and support services? Who will wind up really running the programs? Most of all, will it serve to improve the care patients really receive?

Two facts are important to keep in mind as the pressures grow:

1. Psychiatric patients continue to populate Maryland and the U.S. The continued incidence and probable increasing prevalence of psychiatric illness remains. Most moderately to severely-ill psychiatric patients remain either in inpatient acute/chronic psychiatric State hospital programs or in a variety of outpatient

community programs. As yet, we have cured very few despite the reduction of our inpatient census and the increase in the ambulatory impaired.

2. Smaller psychiatric State facilities continue to be built in Maryland. These smaller units, with more modern beds closer to their community population centers, are needed to meet patient needs. The Carter Center, the Finan Center, the Regional Institutes for Children and Adolescents in Baltimore City and Montgomery County, and the Upper Shore Comprehensive Mental Health Center have all been planned to complement services at Maryland's larger regional State facilities. The State is heavily invested in the care of its psychiatric patients in the public sector, a responsibility that seems likely to remain one for the State to meet.

Despite the large number of psychiatric patients in the public sector, and the wealth of psychiatric expertise in the private and university sectors, the interface between the two has not been optimal. The potential for collaboration and integration has been documented by the American Psychiatric Association Consultation and Evaluation Board Study and affirmed in private discussions with members of the Maryland Psychiatric Society from the private, public and university sectors.

It is important to examine three specific areas of potential collaboration:

1. Should more *senior* psychiatrists in Maryland become involved in State hospital and community programs in roles as part-time attending psychiatrists, consultants and/or supervisors?

2. Should more *younger* psychiatrists in Maryland become involved in State hospital and community programs in:

- a) Clinical roles i.e., full-time psychiatrists; i.e., 1/2-time psychiatrists; i.e., part-time psychiatrists with special functions involving psychiatric emergencies, evaluations, treatment planning, treatment, medications, etc.?

- b) Administrative Leadership Roles

3. Should psychiatric *residency* training in the public sector (State) be

- a) Integrated with JHU/Sheppard/Univ. of MD i.e., Carter Center, Springfield?

- b) Broadened to include community and specialized services, i.e., Carter Center Perkins?

- c) Phased out

Psychiatry will only continue to provide leadership in Mental Hygiene in Maryland with more and stronger support from the Maryland psychiatric community. If psychiatrists are not to continue in their historic leadership roles in the administration and organization of public and non-public service systems, then what roles should remain for the psychiatrist to function in? The kind of focus and support that the Maryland Psychiatric Society gives to these questions and to Mental Hygiene in Maryland will be crucial, as the pressures and conflicts continue. . .

Panel Discussion:

The Hon. State Sen. Rosalie Abrams (D.)

The Senator's remarks focused on increasing governmental regulation of the entire health care community. Specifically, measures have recently been aimed at cost containment and greater organization of health care delivery. The legal profession has amplified issues concerning human rights in the public sector and recent court decisions have begun to clarify issues involving patients' rights to treatment. The Humane Practices Commission in Maryland, which Sen. Abrams chairs, has helped to highlight some of the deficits within the public sector care delivery system and has explicitly encouraged greater collaboration between the State and University programs for the benefit of patients and physicians-in-training. Her concluding statements encouraged the Maryland Psychiatric Society to be as active as possible in providing psychiatric leadership in the public sector, to prevent decisions being made without their input and expertise.

John Hamilton, MD

(Superintendent, Spring Grove State Hospital)

Dr. Hamilton expressed concern about the two-tract system of care for psychiatric patients in the U.S. He delineated the tract for the public sector, which cares for the chronically-ill, the

physically-unattractive and the minority group members who are inarticulate about their needs. The care in the public sector has far fewer resources available to it and is less humane. As yet, there is no commitment to make a one-tract system for psychiatric care in the US as there has been for treatment of other medical illnesses. An example of the disparity within the medical and psychiatric systems involves the differences in resources allocated for treatment of acute coronary illnesses and acute psychotic illnesses. Until the psychiatric and health care communities address themselves to a one-tract system of care for psychiatric illness, the public sector will continue to be underserved, underfunded, less effective and less humane than is appropriate and potentially-possible.

Stanley Platman, MD

(Assistant Secretary for Mental Health and Addictions; Associate Professor of the Department of Mental Hygiene, the School of Hygiene and Public Health, the Johns Hopkins University and Clinical Professor of Psychiatry at The University of Maryland School of Medicine.)

Dr. Platman noted Dr. Nyman's focus on psychiatry's authority and Sen. Abrams' and Dr. Hamilton's focus on the challenges facing and responsibilities of psychiatry. His recent review of the Presidential papers of the American Psychiatric Association revealed a frequent historic repetition of today's panel and its concerns. The APA founded by psychiatrists in the public sector, has evolved under leadership of the private and university sectors. With this shift, have some concerns for the responsibilities within the public sector been lost? Twenty years ago, Dr. Harry Solomon, in his Presidential paper, voiced very similar concerns about public sector psychiatry.

Dr. Platman responded explicitly to the three specific areas of potential collaboration. He supported the involvement of more senior psychiatrists in the public sector care delivery system, especially on a consulting basis. He supported the involvement of more younger psychiatrists in the public sector full-time, to allow them the authority for programmatic input that cannot occur from only a *part-time* commitment. He agreed with the non-viability of free standing State residency training programs and the necessity of integrating them with the university and private sectors to provide quality training and care to their patients. He explicitly encouraged the integration aspects of private and university sector psychiatry with the public sector to improve the quality of care for psychiatric patients in our communities.

Chester Schmidt, MD

(Chief of the Department of Psychiatry at Baltimore City Hospitals; President of the Chesapeake Physicians, PA and Associate Professor of Psychiatry and the Johns Hopkins University School of Medicine.)

Dr. Schmidt expressed his agreement with the preceding panelists. As a psychiatrist in both the private and academic sectors, he levied criticism at himself and his colleagues for an abdication of psychiatric leadership in the treatment of the severely-mentally-ill. He commented on the vulnerability of medical leadership in psychiatry to further deprofessionalization and on the potential resolution of the identity of psychiatry with a renewed focus in the treatment of the severely-mentally-ill. The time for reinvestment in the needs of patients in the public sector has arrived and with it has come the need for utilization of those special skills that psychiatrists have as physicians.

Audience Commentary/Discussion

The audience participation was complex, varied and intense. Over 20 professionals chose to comment during a 40-minute period of time. Comments came from psychiatrists in private practice, in the public sector, holding academic positions and with child, adolescent, forensic and psychoanalytic interests. Two comments were made by non-psychiatrists and fit into the general themes of the entire commentary/discussion.

Many of those who expressed themselves were eloquently-summarized by one who said, "Philosophy follows funding (Cohen's Law)." Complaints about inadequately-funded programs, poor salaries, non-reimbursement of malpractice insur-

ance and increasing governmental regulation constraints were expressed. These complaints contributed to what one psychiatrist labeled as the two-tract system, with psychiatric care in the public sector suffering on the lower tract.

Responses also included the realities of these constraints as increasing in the future and as necessary to be worked within and/or effectively-changed. Administrative changes in the public sector of mental hygiene, that decreased the explicit authority of psychiatrists, were noted to be due to the recent vacuum and absence of psychiatric leadership that had existed. Voices were also raised about working to develop a one-tract system and the need for participation of private and university psychiatrists within the public sector.

A startling element of the discussion that continued to the end was its intensity. The comments and responses contained an energy and sense of personal commitment that kept the attention of the audience at a continually-high level. There was real concern about the future of psychiatry in the public sector and about the need for psychiatrists to become more involved in contributing to and shaping the destiny of mental hygiene in Maryland. This concern remains and facilitates the Mental Hygiene Administration's gradually increasing involvement of private and university sector psychiatrists into the public sector in Maryland.

Summary

The 1977 Annual Dinner Meeting of the Maryland Psychiatric Society focused on the relationship between the Maryland psychiatric community and the State's Mental Hygiene Administration. The very large turnout for the dinner, the presentation, the panel discussion and the audience commentary revealed intense interest in expanding collaboration among Maryland's public, private and university psychiatric sectors. Issues involving the politics, the capabilities and the economics of psychiatric consultation, staffing and residency training within the State's programs were explicitly and frankly-explored. Underlying this discussion was a renewing interest of psychiatric leadership for public Mental Hygiene programs in Maryland.

Acknowledgments

The authors would like to express their appreciation to Dr. Clarence Schulz and members of the Maryland Psychiatric Society Program Committee for their help with this program. In addition, we also thank Dr. Lex Smith, Past President of the Maryland Psychiatric Society, for his support and moderation of the entire program and discussion. □

PRESCRIPTION

The Maryland Board of Pharmacy has received a number of complaints concerning illegibly written prescriptions. Unclear instructions may cause improper labeling and ultimate potential harm to the patient. The Faculty's Committee on Drugs has also encountered similar problems. Physicians are requested to use extreme care in writing prescriptions.

LEGIBILITY

PRIMARY

A research project is currently underway to provide accurate statistical data on primary care physicians in the Baltimore City area. A questionnaire is to be mailed to all physicians in Baltimore City to determine the amount of primary care delivered in their offices.

PHYSICIAN

SURVEY

Any inquiries on the survey questionnaire should be directed to the Baltimore City Medical Society which is a cosponsor of the survey. This survey also has the endorsement of the Faculty.

All names will be removed from questionnaires and individual physicians will not be identified.

ABORTION

INFORMATION

LAW

A law passed in the 1979 General Assembly requires physicians to inform patients about financial and other resources available for carrying the pregnancy to term, for raising the child, and adoption facilities before performing abortion. The patient seeking an abortion must sign a document to be part of the medical record indicating that such information has been received. Failure to notify the patient constitutes a misdemeanor.

The Department of Health and Mental Hygiene and the Social Services Administration have developed the necessary information packets and have distributed them to abortion clinics and hospitals. Individual physicians wishing to obtain information packets should contact the Social Services Administration at 383-3614.

REPORT

ON

HMOs

The Faculty's Ad Hoc Committee on HMOs will make a report to the Council when it meets on Saturday, September 29, 1979. If adopted, the report will be available through the Faculty office.

The ad hoc committee was formed to review local HMO operations and to make recommendations, if any, for correction of any abuses that may be taking place.

NEW
SUBCOMMITTEE -
"60 PLUS CLUB"

A new subcommittee of the Physicians' Rehabilitation Committee has been formed—the "60 Plus Club." The short term purpose is to initiate financial, social and recreational retirement programs for physicians, the objective being to offset the stresses which are peculiar to the profession which could affect the physician's practice, as well as his personal life in later years. The long term goal is the education of young physicians, stressing the importance of developing interests outside the profession.

The first and foremost purpose is to set up a "job bank" for physicians who wish to retire from active practice, yet continue some responsibilities within medicine, or for physicians who wish to gradually diminish their active practice, but remain busy with additional duties of another nature. Spouses of members will be invited to join as well.

Any physician interested in assisting should call either Mrs. Constance Townsend in the Faculty office, 539-0872, or Lester Kolman, MD, at 358-6252.

AMPHETAMINE
REGULATIONS
AMENDED

The State Amphetamine Regulations, restricting the prescribing of amphetamines, have recently been slightly amended. Copies of the new regulations will soon be forwarded to you from the Department of Health and Mental Hygiene, and they will be published in the Journal at a later date. In the meantime, copies will be available in the Faculty office.

SEMIANNUAL
SESSION

The Faculty's Semiannual business meeting will be held on Saturday, September 29, 1979, at 2 PM at the Faculty Building.

The official call to the meeting has been sent to all those involved, including component society officials and executives.

Members may obtain a copy of the agenda through the Faculty office.

LAWS, RULES
AND

A newly revised issue, effective August, 1979, of Laws, Rules and Regulations/Compendium of Faculty Decisions, is available through the Faculty office.

REGULATIONS

The 1979 Handbook is also available through the Faculty office. This booklet contains a listing of Faculty officials, Faculty committees, and officers of the component and statewide specialty societies.

A reminder

ZYLOPRIM[®]

(allopurinol)

100 and 300 mg scored Tablets

- inhibits uric acid formation
- helps prevent urate crystal depositions in synovia
- reduces risk of uric acid lithiasis

INDICATIONS AND USE: This is not an innocuous drug and strict attention should be given to the indications for its use. Pending further investigation, its use in other hyperuricemic states is not indicated at this time.

Zyloprim[®] (allopurinol) is intended for:

1. treatment of gout, either primary, or secondary to the hyperuricemia associated with blood dyscrasias and their therapy;
2. treatment of primary or secondary uric acid nephropathy, with or without accompanying symptoms of gout;
3. treatment of patients with recurrent uric acid stone formation;
4. prophylactic treatment to prevent tissue urate deposition, renal calculi, or uric acid nephropathy in patients with leukemias, lymphomas and malignancies who are receiving cancer chemotherapy with its resultant elevating effect on serum uric acid levels.

CONTRAINDICATIONS: Use in children with the exception of those with hyperuricemia secondary to malignancy. The drug should not be employed in nursing mothers.

Patients who have developed a severe reaction to Zyloprim should not be restarted on the drug.

WARNINGS: ZYLOPRIM SHOULD BE DISCONTINUED AT THE FIRST APPEARANCE OF SKIN RASH OR ANY SIGN OF ADVERSE REACTION. In some instances a skin rash may be followed by more severe hypersensitivity reactions such as exfoliative, urticarial and purpuric lesions as well as Stevens-Johnson syndrome (erythema multiforme) and very rarely a generalized vasculitis which may lead to irreversible hepatotoxicity and death.

A few cases of reversible clinical hepatotoxicity have been noted and in some patients asymptomatic rises in serum alkaline phosphatase or serum transaminase have been observed. Accordingly, periodic liver function tests should be performed during the early stages of therapy, particularly in patients with pre-existing liver disease. Patients should be alerted to the need for due precautions when engaging in activities where alertness is mandatory.

Nevertheless, iron salts should not be given simultaneously with Zyloprim. This drug should not be administered to immediate relatives of patients with idiopathic hemochromatosis.

In patients receiving Purinethol[®] (mercaptopurine) or Imuran[®] (azathioprine), the concomitant administration of 300-600 mg of Zyloprim per day will require a reduction in dose to approximately one-third to one-fourth of the usual dose of mercaptopurine or azathioprine. Subsequent adjustment of doses of Purinethol or Imuran should be made on the basis of therapeutic response and any toxic effects.

Usage in Pregnancy and Women of Childbearing Age: Zyloprim[®] (allopurinol) should be used in pregnant women or women of childbearing age only if the potential benefits to the patient are weighed against the possible risk to the fetus.

PRECAUTIONS: Some investigators have reported an increase in acute attacks of gout during the early stages of allopurinol administration, even when normal or sub-normal serum uric acid levels have been attained.

It has been reported that allopurinol prolongs the half-life of the anticoagulant, dicumarol. This interaction should be kept in mind when allopurinol is given to patients already on anticoagulant therapy, and the coagulation time should be reassessed.

A fluid intake sufficient to yield a daily urinary output of at least 2 liters and the maintenance of a neutral or, preferably, slightly alkaline urine are desirable to (1) avoid the theoretic possibility of formation of xanthine calculi under the influence of Zyloprim therapy and (2) help prevent renal precipitation of urates in patients receiving concomitant uricosuric agents.

Patients with impaired renal function require less drug and should be carefully observed during the early stages of Zyloprim administration and the drug withdrawn if increased abnormalities in renal function appear.

In patients with severely impaired renal function, or decreased urate clearance, the half-life of oxipurinol in the plasma is greatly prolonged. Therefore, a dose of 100 mg per day or 300 mg twice a week, or perhaps less, may be sufficient to maintain adequate xanthine oxidase inhibition to reduce serum urate levels. Such patients should be treated with the lowest effective dose, in order to minimize side effects.

Mild reticulocytosis has appeared in some patients.

As with all new agents, periodic determination of liver and kidney function and complete blood counts should be performed especially during the first few months of therapy.

ADVERSE REACTIONS:

Dermatologic: Because in some instances skin rash has been followed by severe hypersensitivity reactions, it is recommended that therapy be discontinued at the first sign of rash or other adverse reaction (see WARNINGS). Skin rash, usually maculopapular, is the adverse reaction most commonly reported.

Exfoliative, urticarial and purpuric lesions, Stevens-Johnson syndrome (erythema multiforme) and toxic epidermal necrolysis have also been reported.

A few cases of alopecia with and without accompanying dermatitis have been reported.

In some patients with a rash, restarting Zyloprim (allopurinol) therapy at lower doses has been accomplished without untoward incident.

Gastrointestinal: Nausea, vomiting, diarrhea, and intermittent abdominal pain have been reported.

Vascular: There have been rare instances of a generalized hypersensitivity vasculitis or necrotizing angitis which have led to irreversible hepatotoxicity and death.

Hematopoietic: Agranulocytosis, anemia, aplastic anemia, bone marrow depression, leukopenia, pancytopenia and thrombocytopenia have been reported. In patients, most of whom received concomitant drugs with potential for causing these reactions. Zyloprim[®] (allopurinol) has been neither implicated nor excluded as a cause of these reactions.

Neurologic: There have been a few reports of peripheral neuritis occurring while patients were taking Zyloprim. Drowsiness has also been reported in a few patients.

Ophthalmic: There have been a few reports of cataracts found in patients receiving Zyloprim. It is not known if the cataracts predated the Zyloprim therapy. "Toxic" cataracts were reported in one patient who also received an anti-inflammatory agent; again, the time of onset is unknown. In a group of patients followed by Gutman and Yü for up to five years on Zyloprim therapy, no evidence of ophthalmologic effect attributable to Zyloprim was reported.

Drug Idiosyncrasy: Symptoms suggestive of drug idiosyncrasy have been reported in a few patients. This was characterized by fever, chills, leukopenia or leukocytosis, eosinophilia, arthralgias, skin rash, pruritus, nausea and vomiting.

OVERDOSAGE: Massive overdosing, or acute poisoning, by Zyloprim has not been reported.

HOW SUPPLIED: 100 mg (white) scored tablets, bottles of 100 and 1000; 300 mg (peach) scored tablets, bottles of 30, 100 and 500. Unit dose packs for each strength also available.

Easier to Find Surgeon to Replace Heart Valve Than Family Doctor to Treat Strep Throat, Sen. Mathias Says

"It is easier to find a heart surgeon to replace your damaged valve than to find a family doctor to treat your strep throat and prevent your valve from being damaged in the first place," according to US Senator Charles McC. Mathias, Jr. (R-MD).

The Maryland senior Senator addressed the Maryland Chapter of the American Academy of Family Physicians in Bethesda recently.

"Until we resolve this paradox, we will never reverse the present trend in health care costs," he warned. "If we could increase the number of family physicians, we would decrease demand for hospital care and subspecialty, high technology care."

Pointing out that "Health care costs have risen two-and-a-half times faster than the cost of living," Sen. Mathias lamented that "People can no longer afford to get sick."

If hospital stays could be foreshortened for each patient by one day, "It would save us \$5 or \$6 billion at the rate costs are going up," he predicted.

"Developments in medical research and technology have brought medical treatment in this country to the point where the United States is the technical envy of the world, but, somehow, despite every new triumph, the system inches closer and closer to bankruptcy," Sen. Mathias continued.

"These technological developments have fostered a decline in general practice. Too many medical students have chosen, and are still choosing, to become subspecialists, rather than to go into primary care," he explained.

In Maryland, he said, only about 10% of the physicians are family physicians. "In fact, there is only one family physician for every 4,876 people in the state, whereas I am told that we need at least one family physician for every 2,500 people."

Discussing possible remedies, Sen. Mathias said that "We do have four excellent civilian Family Medicine residency programs in Maryland and having a Department of Family Medicine in our state Medical School is also an important step, but that still is not enough."

He recommended that third party payors (Federal, State and private) "Begin to reimburse family physicians more equitably and at rates that would bring their incomes more into line with their subspecialty colleagues. Simple justice demands that they be paid the same fee for the same service." □

Discipline Commission Action

Editor's Note: On instruction of the Council of the Medical and Chirurgical Faculty of the State of Maryland, "Findings of Fact, Conclusions of Law and Order" will be published in the JOURNAL as cases become final.

IN THE MATTER OF MOHAMMAD BALOCH, MD, BEFORE THE
COMMISSION ON MEDICAL DISCIPLINE OF MARYLAND

Disposition Agreement

The Commission on Medical Discipline of Maryland (the "Commission") and Mohammad Baloch, MD, (the "Respondent") enter into the following Agreement, this 18th day of December 1978, regarding certain charges filed by the Commission on or about Jan. 13, 1978, against the Respondent's license to practice medicine in the State of Maryland:

1. The Respondent shall execute the attached Order simultaneously with his execution of this Agreement.

2. The Commission will defer execution of the attached Order for three years, provided, however, that the Commission shall execute the Order upon the earlier occurrence of any of the following:

(a) The practice of medicine by Respondent other than in the military service of the United States;

(b) The filing of an application by Respondent for a medical license in any state, territory or possession of the US, or the District of Columbia;

(c) The filing of a petition by the Respondent with the Commission requesting a determination that he is competent to practice medicine;

(d) The failure of the Respondent to enter into a residency program acceptable to the Commission within one year of the date of this Agreement;

(e) If admitted to a residency program, the termination of Respondent's participation in said residency program without the Commission's permission.

(f) The failure of Respondent to furnish quarterly reports to the Commission from his supervising medical officer describing his status and his practice of medicine in the military service.

3. Should the Commission have occasion to execute the attached Order prior to the expiration of the aforesaid three year period, it may do so without a hearing, but such action shall occur no sooner than 10 days after notice is sent to Respondent at the following address:

Mohammad Baloch, MD
c/o John R. Francomano, Esq.
501 Keyser Bldg.
Calvert and Redwood Sts.
Baltimore, MD 21202.

WITNESS the hands and seals of the Commission on Medical Discipline by JOHN E. ADAMS, MD, Chairman and MOHAMMAD BALOCH, MD, the day and year first above written.

MOHAMMAD BALOCH, MD
JOHN E. ADAMS, MD, Chairman
Commission on Medical Discipline of Maryland

STATE OF MARYLAND, COUNTY/CITY OF BALTIMORE,
to wit:

I HEREBY CERTIFY, that on this 18th day of December, 1978, before me, the subscriber, personally appeared MOHAMMAD BALOCH, MD, who made oath in due form of law that the foregoing Agreement is his voluntary act and deed.

AS WITNESS my hand and Notarial Seal.

Notary Public

Findings of Fact, Conclusions of Law and Order

Upon certain information coming to its attention pursuant to the provisions of Art. 43, Sec. 130 of the Annotated Code of Maryland, the Peer Review Committee of the Medical and Chirurgical Faculty of the State of Maryland initiated an investigation into the medical practice of the Respondent, Mohammad Baloch, MD. Thereafter, the Commission on Medical Discipline of Maryland, after considering the report and recommendation submitted by the Peer Review Committee, determined to charge the Respondent with certain violations of the Code. The violations charged involved the following subsection of Article 43, Section 130 (h):

(18) Professional incompetence.

Appropriate notice of the charges and the grounds from which they arose was given to the Respondent and a hearing on said charges was scheduled to be held on Feb. 14, 1978. Prior to the convening of that hearing, the Commission was contacted by John Francomano, Esq., the Respondent's counsel, with regard to the charges. Following discussions between Mr. Francomano and Jack C. Tranter, Assistant Attorney General, counsel for the Commission, the Respondent agreed to enter into a Consent Order as proposed by the Commission.

Findings of Fact

The Commission finds:

1. That Respondent maintained inadequate office equipment for the performance of minor surgery in a rural family practice setting.

2. That the Respondent's medical records are not consistent with the standards required from a competent practitioner of family medicine in Maryland.

3. That the Respondent lacked sufficient medical knowledge to engage in the unsupervised practice of family medicine.

Conclusions of Law

Based upon the foregoing Findings of Fact, the Commission concludes as a matter of law that the charge has been substantiated and that Respondent is GUILTY of that charge.

Order

From the foregoing Findings of Fact and Conclusions of Law it is this 12th day of December, 1978, by the unanimous vote of the entire Commission on Medical Discipline

ORDERED that the license to practice medicine and surgery in the State of Maryland heretofore issued to the Respondent Mohammad Baloch, MD, by the Board of Medical Examiners is hereby REVOKED: and be it further

ORDERED that the Commission shall STAY the revocation of Respondent's license and place Respondent on PROBATION subject to the Conditions the Commission deems appropriate, if Respondent:

1. Successfully completes a residency program acceptable to the Commission and demonstrates to the Commission's satisfaction that he is competent in his chosen field;

2. Becomes Board certified in his chosen field or

3. Otherwise demonstrates to the Commission's satisfaction that he is competent to practice in his chosen field; and be it further

ORDERED that a copy of this Order be filed with the Board of Medical Examiners of Maryland in accordance with Article 43, Section 130 (m) of the Annotated Code of Maryland.

JOHN E. ADAMS, MD
Chairman

Consent

By this Consent, I hereby accept and submit to the foregoing Order. While I make no admissions as to the Findings of Fact and Conclusions of Law, I acknowledge the validity of the Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses in my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my rights to appeal any adverse ruling of the Commission that might have followed any such hearing. By this Consent, I waive all such rights. I further recognize that the Commission's execution of this Order is subject to the terms of a Disposition Agreement dated December 19, 1978.

I sign this Consent without reservation, fully understanding its meaning and after consultation with my counsel.

MOHAMMAD BALOCH, MD

STATE OF MARYLAND, COUNTY/CITY OF BALTIMORE,
to wit:

I HEREBY CERTIFY, that on this 19th day of December, 1978, before me, the subscriber, personally appeared MOHAMMAD BALOCH, MD, and he made oath in due form of law that the foregoing Consent is his voluntary act and deed.

AS WITNESS my hand and Notarial Seal.
Notary Public ☐

IN THE MATTER OF LEONARD H. FLAX, MD BEFORE THE
COMMISSION ON MEDICAL DISCIPLINE OF MARYLAND

Findings of Fact, Conclusions of Law and Order

At its Nov. 21, 1978 meeting, the Commission on Medical Discipline (the "Commission") considered a report and recommendation submitted by letter dated Oct. 25, 1978 by the Baltimore County Medical Association regarding the surgical care rendered by Leonard H. Flax, MD (the "Respondent") for his patient, Mary J. Ramsey. This report and recommendation resulted from a complaint received by the Commission and a referral of that complaint to the Baltimore County Medical Association for investigation.

Based on the report and recommendation received, the Commission on Nov. 27, 1978 issued an Order for Emergency Suspension of License which order summarily suspended the Respondent's medical license insofar as that license permitted him to engage in operative surgery. A hearing to consider the summary suspension was scheduled for Dec. 5, 1978 to consider whether it would be continued during a complete review by the Commission of Respondent's medical practice and prior to a final decision regarding Respondent's medical competence.

On Dec. 5, 1978 the hearing convened before the following members of the Commission: John E. Adams, MD; John Ball, MD; Jerome J. Coller, MD; Vincent Fiocco, MD; Arthur T. Keefe, MD; Eli H. Lippman, MD; Karl F. Mech, MD and Frank Shipley, MD. John E. Adams, MD presided as Chairman of the Commission. Also present were Jack C. Tranter, Assistant Attorney General, to advise the Commission as to rules of evidence and Stephen J. Sfkas, Assistant Attorney General, to present the case on behalf of the Commission. The Respondent appeared represented by Arnold R. Silbiger, Esquire, his counsel. As a result of that hearing the Commission by Order dated Dec. 11, 1978 continued the suspension imposed by the Commission's Nov. 27, 1978 Order. The Commission also ordered that a comprehensive peer review of Respondent's medical practice be immediately begun and scheduled a hearing for Feb. 6, 1979 to consider the charge that Respondent is professionally incompetent and to consider whether permanent sanctions would be imposed on his medical license.

By letter dated Jan. 12, 1979 the Peer Review Committee of the Baltimore County Medical Association (the "Peer Review Committee") filed a report and recommendation with the Commission relating the results of its comprehensive review of Respondent's medical practice. Prior to the hearing scheduled for Feb. 6, 1979, as a result of discussions between Mr. Tranter

TALK TO STEFFEY Realtors since 1915

and Mr. Silbiger, the Commission has determined to enter into the following Consent Order with the Respondent.

Findings of Fact

The Commission finds:

1. That on Apr. 25, 1978, during the performance of a Nissen fundal plication for the repair of an esophageal hiatal hernia for Mary J. Ramsey, the Respondent ligated and divided that hepatic artery and ligated the portal vein.
2. That such actions resulted in massive liver necrosis with death following approximately seventy-two hours after completion of the surgery.
3. That as demonstrated at autopsy, the esophageal hiatus hernia repair was improperly performed.
4. That the care rendered by Respondent for Mary J. Ramsey represents a gross error in surgical treatment and demonstrates a general lack of surgical competence on the part of the Respondent.
5. That the Peer Review Committee in connection with its review of Respondent's practice considered fifteen consecutive cases in which Respondent provided care at Baltimore County General Hospital.
6. That the review of the above fifteen surgical cases revealed no incompetence in the workups or in the surgery performed by Respondent.
7. That the Peer Review Committee's review of Respondent's practice indicates that his office records, though voluminous, often fail to distinguish between significant and insignificant information and also fail to contain a patient's history and physical examination recorded in any one place in a chronological fashion.
8. That the Peer Review Committee's review of Respondent's practice indicates that his hospital records are consistent with the standards expected from a competent surgeon.

Conclusions of Law

Based on the foregoing Findings of Fact, the Commission accordingly adjudicates the Respondent **GUILTY** of the charge of professional incompetence insofar as that charge relates to the care he rendered for Mary J. Ramsey.

Order

Upon the foregoing Findings of Fact and Conclusions of Law it is this 23rd day of February, 1979 by the majority vote of those members of the Commission on Medical Discipline hearing this case

ORDERED that the Suspension of the Respondent's medical license imposed by the Commission's Dec. 11, 1978 Order which prohibited him from performing operative surgery is hereby discontinued; and be it further

ORDERED that Respondent is hereby **REPRIMANDED**; and be it further

ORDERED that Respondent is hereby placed on **PROBATION** subject to the following conditions:

1. That Respondent not perform any major surgery other than in the hospital setting.
2. That Respondent not perform any major surgery in any hospital unless such surgery is performed under the direct observation of the Chief of Surgery or some other physician designated by the Chief of Surgery and acceptable to the Commission.
3. That Respondent shall arrange for the Chief of Surgery or the other physician directly observing his hospital based surgery to submit semi-annual reports to the Commission provided, however, that reports are to be made immediately if a problem is observed.
4. That the Respondent shall submit to a semiannual review of his practice by the Peer Review Committee.
5. That Respondent shall arrange for the Peer Review Committee to submit semiannual reports of the review of his practice to the Commission.
6. That Respondent shall discontinue the performance of vasectomies, circumcisions and lymph node biopsies in his office. He shall confine his office surgery to simple skin lesions which

can be performed under limited local anesthesia, to varicose vein injections, to excision of superficial lipomas, to excision of sebaceous cysts of the skin, to simple excision of ingrown toenails, to incision and drainage of superficial abscesses, to incision and drainage of pilonidal cysts and to incision of thrombosed hemorrhoids. Any other office surgical procedures not included in these categories shall be performed only after written permission from the Commission has been obtained.

7. That Respondent shall obtain at least 100 hours of AMA Category I Continuing Medical Education in each year and be it further

ORDERED that if Respondent violates any of the foregoing Conditions of Probation, if a report submitted by the Peer Review Committee indicates that he is not practicing competently, or if a report submitted by the physician who observes his hospital-based surgery indicates that he is not performing competently, after notification and a hearing, the Commission may revoke the Respondent's license or impose any other disciplinary sanction it deems appropriate and be it further

ORDERED that one year after the date of the Order the Commission will entertain a petition from Respondent to modify Condition #2 so that thereafter it would only be necessary that he be directly observed when he is performing a surgical procedure that had not been previously performed under direct observation; and be it further

ORDERED that three years after the date of this Order, the Commission will entertain a petition to terminate Respondent's probationary status. At such time, if the Commission believes that complete reinstatement would not be appropriate, it may alternatively consider a request to modify one or more of the conditions of Respondent's probation; and be it further

ORDERED that a copy of this Order be filed with the Board of Medical Examiners in accordance with the Maryland Code, Art. 43, Sect. 130 (m).

JOHN E. ADAMS, MD
Chairman
Commission on Medical Discipline

Consent

By this Consent, I hereby accept and submit to the foregoing Order and its conditions. While I do not concur with and make no admissions as to the Findings of Fact and Conclusions of Law made by the Commission, I acknowledge the validity of the Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, and to call witnesses in my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my rights to appeal any adverse ruling of the Commission that might have followed any such hearing. By this Consent, I waive all such rights and acknowledge that by my failure to abide by the conditions of my probation, I may suffer the revocation of my license to practice medicine in Maryland.

I sign this Consent without reservation, fully understanding its meaning and after consultation with my counsel.

Medical and Chirurgical Faculty, the state medical society, conducted an investigation of Harvey Barry Jacobs, MD (the "Respondent"). Thereafter, the Commission on Medical Discipline of Maryland (the "Commission") after considering the reports and recommendation submitted, determined to charge the Respondent with violation of the following subsection of Art. 43, §130 (h):

(4) The physician has been charged with a crime involving moral turpitude, and has entered a nolo contendere or guilty plea or has been convicted of the crime.

Appropriate notice of the charge and the ground from which it arose was given to the Respondent and a hearing on said charges was held on Apr. 3, 1979. The following members of the Commission were present at the hearing: John E. Adams, MD; John G. Ball, MD; Vincent J. Fiocco, Jr., MD; Arthur T. Keefe, MD; Eli M. Lippman, MD; Francis C. Mayle, Jr., MD and Frank H. Shipley, MD. John E. Adams, MD presided as Chairman of the Commission. Also present were Jack C. Tranter, Assistant Attorney General, to advise the Commission as to rules of evidence, and Constance H. Baker, Assistant Attorney General to present the case on behalf of the Commission. The Respondent appeared without counsel.

Following introduction and opening statements, Mrs. Baker presented the case on behalf of the Commission. Mrs. Baker introduced the following documentary evidence:

1. *State's Exhibit #1*: Certified copies of Judgment and Probation/Commitment Order and Docket Entries in *United States of America v. Harvey Barry Jacobs*, Case No. 76-291-A, US District Court for the Eastern District of Virginia.
2. *State's Exhibit #2*: Certified copy of the Indictment in *USA v. Harvey Barry Jacobs*, Case No. 76-291-A, US District Court for the Eastern District of Virginia. Pursuant to an objection by the Respondent, Paragraphs G, J and K were stricken from the copy of the Indictment accepted into evidence.
3. *State's Exhibit #3(c)*: Certified copy of the transcript of the instructions to the jury in *USA v. Harvey Barry Jacobs*, Case

No. 76-291-A, United States District Court for the Eastern District of Virginia.

4. *State's Exhibit #4*: Copy of an unpublished *per curiam* decision of the US Court of Appeals for the Fourth Circuit in *USA, Appellee v. Harvey Barry Jacobs, Appellant*, Case No. 77-2022.
5. *State's Exhibit #5*: Copy of *Jacobs v. US*, No. 77-1424, 98 S. Ct. 3071 (1978)
6. *State's Exhibit #6*: Copy of 18 USC §1341

After the admission of the above specified documentary evidence, Mrs. Baker argued that the Respondent had been convicted of a crime involving moral turpitude. Copies of the following cases were given to the Commission as support for this claim. *Attorney Grievance Commission v. Klauber*, 283 MD 597 (1978); *Attorney Grievance Commission v. Reamer*, 281 MD 323 (1977); *Attorney Grievance Commission v. Walman*, 374 A.2d 354 (1977); *Maryland State Bar Association Inc. v. Kerr*, 272 MD 687 (1974); *Braverman v. Bar Association of Baltimore City*, 209 MD 329 (1955); *Board of Dental Examiners v. Lazzell*, 172 MD 314 (1937). Mrs. Baker then rested the Commission's case.

The Respondent then proceeded to present his case. He professed that he wanted to demonstrate to the Commission that he had been erroneously convicted of 18 USC §§1341 and 2. Mrs. Baker objected arguing that such an inquiry was nothing more than an attempt to retry the criminal case and was an effort inappropriate to this forum. The Commission ruled that it would not accept any evidence regarding the validity or correctness of Respondent's conviction. The Respondent objected to this ruling. He continued his presentation by offering testimony on his own behalf as well as the following documentary evidence.

Respondent's Exhibit #1: Copy of a certificate indicating that the Respondent was awarded First Prize in the Harry H. Kerr Essay Competition, The Washington Hospital Center.

He also sought to introduce a letter dated July 12, 1976 to Vernon L. Case, Manager, the Travelers Insurance Co., from Robert L. Griffith, Program Officer, Contractors, Bureau of Health

Insurance, Department of Health, Education and Welfare. This document was marked for identification as *Respondent's Exhibit #2* but was not admitted into evidence. After closing arguments by Mrs. Baker and the Respondent, the hearing was concluded.

During the hearing, two additional pieces of documentary evidence were introduced by the Commission itself.

1. *Commission's Exhibit #1*: Letter dated March 29, 1979, from Stephen J. Crittenden, Supervisor, Richmond Medicare B, the Travelers Insurance Co., to John E. Adams, MD, Chairman, with a Commission-issued subpoena attached.
2. *Commission's Exhibit #2*: Letter dated March 28, 1979, from Robert L. Griffith, Director, Division of Program Operations, Medicare Bureau, Department of Health, Education and Welfare to John E. Adams, MD with two Commission-issued subpoenas attached.

Findings of Fact

The Commission finds:

1. That on May 27, 1977, the Respondent was convicted of a fraudulent scheme to obtain monies from Medicare and Medicaid in violation of USC Title 18, §§ 1341 and 2, Counts 1, 4, 5, 7 and 9 merged into one count in the US District Court for the Eastern District of Virginia, Case No. 76-291-A.
2. That the Respondent was sentenced to two years imprisonment.
3. That the Respondent's conviction was affirmed by the US Court of Appeals for the Fourth Circuit, Case No. 77-2002, in an unpublished *per curiam* opinion dated February 6, 1978.
4. That the Respondent's petition for a writ of certiorari was denied by the US Supreme Court on June 12, 1978, 98 S.Ct. 3071 (1978).
5. That review of *State's Exhibit #3(c)*, the judge's instructions to the jury, *State's Exhibit #2*, the indictment, and *State's Exhibit #1*, which reflects the jury's verdict, indicates that in finding the Respondent guilty of violating 18 USC §§1341 and 2, mail fraud and aiding and abetting mail fraud, the jury determined and found that the Respondent acted with an intent to defraud.

Conclusions of Law

The Commission concludes as a matter of law:

1. That Maryland law provides that a conviction of mail fraud and aiding and abetting mail fraud constitutes a crime involving moral turpitude only if the jury finds that the acts alleged were committed with an intent to defraud, *Attorney Grievance Commission v. Klauber*, 283 MD 598 (1978). *Attorney Grievance Commission v. Reamer*, 281 MD 323 (1977).
2. That the Respondent's conviction of a fraudulent scheme to obtain monies from Medicare and Medicaid in violation of 18 USC §§1341 and 2 constitutes a conviction of a crime involving moral turpitude since consideration of the allegations of the indictment along with the jury charge indicates that in rendering its guilty verdict the jury found that the Respondent acted with an intent to defraud. Accordingly, the Commission adjudicates the Respondent GUILTY of the charge, Article 43, §130 (h) (4) of the Annotated Code of Maryland.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 25th day of May, 1979 by the unanimous vote of those members of the Commission hearing the case,

ORDERED that the license to practice medicine and surgery issued to the Respondent, Harvey Barry Jacobs, MD by the Board of Medical Examiners is hereby REVOKED.

JOHN E. ADAMS, MD

Chairman

Commission on Medical Discipline

CONRAD ACTON, MD, Editor

General Meeting

(In Dr. Acton's absence, the highlights of the BCMS General Meeting on June 7, 1979 are reported by John H. Hirschfeld, MD.)

Howard Davidov, MD, Chairman of the Membership Committee, presented the following applicants for Active Membership: Drs. Ron Byrenick, Joseph A. Ciotola, James P.G. Flynn, Calvin F. Fuhrmann, Kenneth C. Gertsen, Meyer R. Hanman, John A. Kisly, Chevrru V. Krishnar, James K. Smolev and Harry S. Steven. They were elected and presented with their Membership Certificates.

Mrs. Anderson Speaks

Mrs. Helen Anderson, President of the Women's Auxiliary to the BCMS, spoke briefly, telling of the need for more members. She urged that our spouses should all join. New Auxiliary members automatically become members of the Maryland and AMA Auxiliaries. She reported a first for the Auxiliary. A male, spouse of a female MD was elected a member of the Auxiliary. She also talked of finances, that the group had this year raised \$1,500 for scholarships, for helping the Primary Alcoholism Treatment Center and for helping the Committee on Physical Fitness. She brought up the importance of cash for AMA-ERF (not a raffle). The \$1. charge for AMA-ERF tickets would be considered a contribution for a Medical Education Project of the Auxiliary: what to do about teenage drinking.

Dr. Whitfield's Talk

Carlton Halle, MD, Chairman of the Professional Education Committee, introduced Charles L. Whitfield, MD, whose topic was *New perspectives and Success in Managing the Alcoholic Patient*.

Dr. Whitfield is Director of Alcohol and Drug Abuse Education at the University of Maryland Medical School. He is an excellent teacher and has published many papers. He spoke about three main areas: 1) How do you help an alcoholic recover? 2) How do you make the diagnosis of alcoholism? and 3) Drinking interference with health, job and social activity.

Treatment success means abstinence, or longer periods thereof, and (successful) coping of the family with the disease. Dr. Whitfield emphasized the *danger periods* for the alcoholic, such as holidays, birthdays, anniversaries and other celebrations. Vacations and stress situations also foster recidivism. On the average, he found alcoholics will go through three-eight serious attempts at abstinence to reach sobriety. Crisis situ-

ations will push the alcoholic to seek treatment. The reported success rate is 50-90%; 10% have no perceived crisis. The failures accept skid row. Their intelligence is not intact! Dr. Whitfield gave illustrations of treatment methods and emphasized the importance of calling alcoholism by its name instead of euphemizing it.

Board of Directors Meet

The BCMS Board of Directors at its June 12, 1979 meeting noted a conflict between its meetings on the second Tuesday with meetings of other groups in which several Directors serve. The Directors will meet on the fourth Tuesday from now on.

Financial Report

Kennard L. Yaffe, MD, our Treasurer, interpreted the monthly balance sheet. As projected for the next six months, there may be a \$12,000 deficit between income and expenditures unless the slowly-accrued reserves are tapped. A dues increase two years in a row is not considered appropriate public relations procedure. President Albert M. Antlitz, MD disclosed a new approach that Med-Chi is considering. Instead of dues fixed by specific Bylaw, a variable rate would be used. A budget for each year would be developed sufficiently in advance to be studied and approved by the members. The total, divided by the number of active members, would be the annual dues assessment. This idea will be studied by our own Finance Committee.

Dr. Bormel Reports

Paul Bormel, MD, President of the BCMS Foundation, reported to the Directors on the assets and grants of the Foundation: 18 applications were received and four grants of \$1,000 each were awarded. These went this year to John E. Gordon, Richard D. Kagen, Cecil L. Parker, Jr. and Marilyn D. Short. All are third or fourth year medical students and attend schools outside of Maryland.

Dr. Atkins' Recommendation

Raymond M. Atkins, MD, Chairman of the Ad Hoc Committee on Third Party Carriers, recommended NON-participation in an insurance company's voluntary second surgical opinion program at this time. The Committee considered that participation might amount to a tacit endorsement or advocacy of such policy and so help forge another chain of restraints on surgery. The meager data available shows no rush by patients to obtain second opinions, or benefits to patients, even when utilized. Safeguards presently observed in Mary-

land hospitals are very adequate. Who knows when clamor for a *third* opinion might develop—or when it ultimately could stop?

Fred Heldrich, MD, Chairman of the Professional Education Committee, seems caught in the ebb and flow of proposed general meetings in 1980. Several months ago a list of about 12 topics was proposed for next year and sent to the Directors for consideration prior to preparation of the final programs.

The new topics submitted reflect the qualities suggested by the Directors when reviewing the first list. Your representative regrets that "Pharmacologic Calvinism," which seems most fascinating to him, was low on the Directors' rating. ☐

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physcian Placement Service are charged at the regular Classified Advertising rate.

Alcoholism Services at a Community Health Center

By H. OLGA ZABLOTNY

Ms. Zablotny can be contacted for reprint and other data at 307 John Ave., Linthicum, MD 21090.

Is there help for the alcoholic and his family? Fortunately, for residents of Maryland, the answer is YES! There are many agencies and organizations ready with available assistance. One of these is the Carruthers Community Health Center which serves the residents of South Baltimore. It is housed in the old Holy Cross School located at 112 E. West St. Bought for \$1 and renovated at a cost of \$60,000, it is today a busy place. Funds for its operation are received from Federal, State and city governments.

The Carruthers Community Health Center serves an area that is bordered by Pratt St. to the north, Russell St. on the west and the Patapsco River on the south and east. Here can be found many small, low-cost row houses, but also in this section is the exciting Inner Harbor and Federal Hill, an exclusive neighborhood of renovated, historical homes. In this peninsula can also be found a great deal of industry, including such companies as Bethlehem Steel, Am Star, the Chessie System, General Electric and the Baltimore Gas and Electric Co., which has a generating station.

The Carruthers Center is an outpatient health center ministering to the needs of the emotionally-ill clients, drug and alcohol abusers. It also provides counseling services and therapy to adults and children on both an individual and group basis. Approximately 23,000 people reside in this section. There are 400 active clients who are presently benefiting from the services being offered at the Center. About 200 clients are seen weekly. Of this number about 50% of the adults and 50% of the children suffer from alcohol-related problems.

The peninsular region of South Baltimore has its own unique qualities. The population is predominately white and is comprised of many ethnic groups, and the vast majority of the residents are blue collar workers. Many of the homes here have been inhabited by generations of the same family; however, transients, some of whom can be classified as the Appalachian type, also make their homes here. Drinking in this community is an integral part of the life and entertainment. Indeed, drinking is well-established as part of the culture. A bar, which appears on practically every corner, helps reinforce the alcohol habit and compounds the problems associated with this chemical. Drinking and drunkenness are often considered normal behavior and certain attitudes persist. "All my friends do it; Why shouldn't I drink?; What else is

there to do?" Drinking also bolsters the macho image.

Although the Center, other agencies and organizations are ready and eager to give help, getting clients to avail themselves of the services is not easy. Many alcohol abusers and their families feel there's a stigma attached to seeking help. Motivation is lax. Many don't see their drinking as a problem. Appointments set up for children at the Carruthers Community Health Center are often broken due to the lethargy of parents who don't see that the children get to the Center. Sporadic counseling, which isn't nearly as effective, is the result. The family must be involved for best results. Fortunately, the situation seems to be improving. More families have sought therapy this past year than ever before.

Some clients are sent to the Carruthers Center through referral. Probation officers, doctors, hospitals and industries—such as Bethlehem Steel, the Chessie System and General Electric—find counseling and therapy important factors in the rehabilitation of problem drinkers. At the time of admission, many clients are not happy about the referral, although the benefits derived from the treatment offered are tremendously important to those who take their problems seriously.

The Director of Alcoholism Services of the Carruthers Center is a young social worker named Patrick Scally. Years ago, while attending college, Mr. Scally, a native of South Baltimore, returned to his neighborhood several hours a week to carry out his field placement. After graduating in 1972, he came back to this area to work permanently.

Mr. Scally and his staff are meeting the challenges in many ways. In addition to the work done at the Center, the staff is part of COPO (Coalition of Peninsula Organization), a group representing health agencies, the Police Department and churches, which studies the problems and tries to find solutions. COPO also informs and aids the neighborhoods. A task force holds weekly meetings at Southern High School, which is located in this district. The curriculum at the school today includes courses in alcohol and drug abuse. AA meetings are held daily and, on Sundays, there are two AA meetings.

In 1976, Friendship House, a halfway house for alcoholics who have no home to immediately return to, was established. Mr. Scally is very happy about this achievement. Friendship House is funded by a State grant. Here group meetings are held and therapy continued. Many of the members help with neighborhood meetings and projects.

The success rate in the rehabilitation of alcoholics

is believed to be rather consistent. It is estimated that the Carruthers Center is of some help to 50% of those involved in alcohol abuse. Another 25-30% have managed at least three months of sobriety. Occasionally, former clients who have managed to stay sober for longer periods of time visit the Center.

Women alcoholics generally do not go for help until much later in life. Usually, these women have serious physical problems and it is the hospital which sends them to the Center for help. Children who get off dangerous drugs like PCP often replace the drug addiction with alcohol addiction. When senior citizens are in need of help, it is generally senior citizens' organizations which are instrumental in getting the problem drinkers to seek assistance. Antabuse is being used in the treatment of alcoholics and having positive results. □

In Memoriam:

I. Ridgeway Trimble, MD (1900-79)

By ROBERT C. KIMBERLY, MD

For reprint and other data, Dr. Kimberly can be contacted at 1120 Bellemore Rd., Balto., MD 21210.

Maryland lost one of its most eminent physicians on Apr. 17, 1979, when Dr. I. Ridgeway Trimble died of a brain tumor at the age of 78. Born in Baltimore of a distinguished line of physicians and soldiers, Dr. Trimble was educated at Gilman School and Princeton University, graduating from the Johns Hopkins Medical School in 1926. He practiced surgery in Baltimore until 1942, when he was commissioned a Lieutenant Colonel in the United States Army and appointed Chief of the Surgical Service of the 118th General Hospital, one of the Army hospitals affiliated with Hopkins. In 1943, he was appointed to the staff of General Douglas MacArthur as Chief Surgical Consultant for the Southwest Pacific Theater of Operations, being responsible for the surgical care of all Army personnel in the theater.

At the end of the war, Col. Trimble arrived in Japan with the first contingent of American troops to enter that country and was the first American medical officer to visit Hiroshima after the atomic bomb had been dropped on that city in August, 1945. He was awarded the Legion of Merit before being relieved of active duty in 1946, and the same year was one of the founders of the Society of Medical Consultants to the Armed Forces, serving as its President in 1952, when he also organized the Civilian Consultant Program for Maryland, assigning former medical officers to assume responsibility for the medical care of military personnel and their dependents at Fort Meade, the Aberdeen Proving Ground and the Army Chemical Center at Edgewood. He made several trips to Europe and the Far East, visiting all the overseas Army hospitals for

the Surgeon General of the Army, too.

Resuming the practice of surgery in Baltimore, Dr. Trimble found time to write the chapter on surgery of the stomach for Lewis's *System of Surgery*. He organized the vascular clinic at the Johns Hopkins Hospital and taught many younger surgeons the technique of sympathectomy and the correction of aortic aneurysms.

Dr. Trimble developed the first one-stage operation for cancer of the pancreas, and wrote extensively on surgery of the breast, being a firm believer in the value of the Halstead operation for the radical cure of cancer of the breast.

Dr. Trimble was Professor of Surgery at the Johns Hopkins Medical School as well as at the University of Maryland Medical School, and was on the staffs of seven Baltimore Hospitals. He was a Fellow of the American Surgical Association and the Southern Surgical Association and a member of many other surgical societies, as well as being a founder of the Society for Vascular Surgery.

In 1945, the-then Col. Trimble

DR. TRIMBLE

was married to Dr. Frances H. Smith in Sydney, Australia, who was later a coauthor in some of his writings on surgery of the breast. He is also survived by a daughter, Miss Elizabeth Trimble of Baltimore; two sons, Dr. I. Ridgeway Trimble, Jr. of Santa Monica, CA and Edward L. Trimble of Baltimore.

No surgeon in Baltimore was called on for help by his colleagues more frequently than Dr. Trimble. He would literally go anywhere at any time to help another surgeon or to teach a new technique. His consultations were thorough and precise and his judgment always accurate. His mere presence in a hospital room was a great comfort to the patient, the family and to the attending surgeon. He will be sorely-missed by all, not least by surgeons whom he had many times helped out of difficulties. His unfailing good humor and concern for his colleagues will long be remembered. □

AN EXTENSION OF HOPE FOR THE ALCOHOLIC

HIDDEN BROOK BEL AIR

Established 1968

We are pleased to announce the opening of Hidden Brook at Warwick. This is a major new enlargement of our capacity for the treatment of alcoholics ...an expansion of 20 additional beds to the 39 already at Bel Air. Beautifully situated on the waterfront of the Warwick River near Secretary, Maryland in Dorchester County...the total environment is peaceful and ideally conducive to rehabilitation. The program, philosophy and rates of Hidden Brook at Warwick will be identical and interchangeable in every respect with the program at Hidden Brook, Bel Air. Request our brochure. Write or phone for information.

Now, in addition HIDDEN BROOK at WARWICK

Medicine in the People's Republic of China

By HUANG CHIA-SSU, BS, MD, MS(Surg.)

Introduction

On May 13, 1979, Huang Chia-ssu, MD, addressed a special meeting of the Baltimore City Medical Society and the Faculty at the Village of Cross Keys' White Oak Ballroom in Baltimore. Dr. Huang is President of the Chinese Academy of Medical Sciences at Peking, Editor-in-Chief of the *Chinese Medical Journal* (English Edition) and Vice President of the Chinese Medical Association. As part of his extended lecture tour of the United States, Dr. Huang participated in the Congress on Medical Education in Washington, DC the week of May 7th.

Arrangements for the visit to Baltimore, cosponsored by BCMS and the Faculty, were made in cooperation with Jackson W. Riddle, MD, PhD, of the AMA Division of Educational Policy and Development.

Dr. Huang was made an honorary citizen of Baltimore by Mayor William Donald Schaefer in a proclamation presented by John B. De Hoff, MD, Baltimore's Commissioner of Health.

ALBERT M. ANTLITZ, MD

President, Baltimore City Medical Society

Dr. Huang's Talk

Shortly after the founding of the People's Republic of China, a health policy consisting of "Being geared to the needs of the workers, peasants and soldiers," "Putting prevention first," "Uniting the doctors of the traditional Chinese and western medicine" and "Integrating the health work with mass movement" (sic) was formulated, and, since then, our health work adhered closely to this policy with enormous progress. Please allow me to present briefly medicine in China under the following headings: health delivery system, medical education the integration of traditional Chinese with modern medicine, the control and extermination of communicable diseases and medical research.

Health Delivery System

When the People's Republic of China was founded in 1949, our health service was extremely inadequate. According to the statistics of the year 1950, there were altogether 2,880 hospitals in the whole country, and they were mostly located in big cities with only a few in the counties. The number of hospital beds were less than 100,000 in the whole country, with 85% in cities and 15% in the counties. As to the vast rural areas, there was practically no health service available.

Under the guidance of the policy "Being geared to the needs of workers, peasants and soldiers," i.e. to serve the vast majority of people, our health delivery system has been very rapidly developed, and attention has been paid to the balanced distribution of health service facilities in urban and rural areas. The number of hospitals in 1965 was 3.7 times that of 1950, and that of hospital beds 7.3 times greater. The increase of hospital beds was much more in the counties, being 11.3 times that of 1950, and the commune hospitals

came into existence with about 95,000 beds. At the end of 1977, there were 64,000 hospitals with 1,776,000 beds. About 40% of the beds were in city hospitals, 20% in county hospitals and 40% in commune hospitals.

At the grass-roots level in the countryside, we adopt a cooperative health system. In our country, the social and administrative organizations for rural areas under the counties are people's communes, under which are production brigades, and under brigades are production teams. The corresponding medical organizations are hospitals, epidemic prevention stations and maternity and child health stations in the counties, the commune hospitals in the people's communes, the cooperative health stations in the production brigades and health workers in production teams, thus forming a health service network. The peasants pay a small sum of money for health care, and an equal or larger amount is paid from a collective accumulation fund of the production teams. In this way, the peasants get free or partially-free medical care in the cooperative health stations. In case of necessity, they are sent to commune or county hospitals, and all or a major part of the charges are paid for by the collective health fund.

THE AUTHOR (left) with **ALBERT M. ANTLITZ, MD** (right), Baltimore City Medical Society President.

(Photograph by Bernadette Lane, BCMS Executive Director.)

All governmental office workers, factory workers and students have free medical care.

Medical Education

In old China, there was no definite system for medical education. Some medical colleges were run by the state, some by private enterprise and still others by foreign missionaries or other foreign organizations, of which the best known was the Peking Union Medical College financed by the Rockefeller Foundation. The colleges run by foreigners followed the educational system of their own countries, while those run by the Chinese gave the type of education which the organizers had themselves received. There was no Chinese system of medical education ever formulated. Medical doctors were classified into the British-American school, the German school, the French school or the Japanese school, and, as a whole, they were called doctors of the western school; there was no Chinese school of modern medicine.

Old China had 32 medical colleges, all located in big cities. For example, in Shanghai, there were seven medical colleges, while in a number of provinces not a single one existed.

Since the liberation, several important measures have been taken in the reform of medical education. The first one was the reallocation of medical schools in 1952 so as to correct their unreasonable geographic distribution. Of the seven medical colleges in Shanghai, the private Tung-te Medical College, the St. Johns University Medical School of an American mission and the Aurora University Medical School of a French mission were combined to form the Shanghai Second Medical College. The private Tung-nan Medical College was moved to Anhui province and became the Anhui Medical College. The Tung-chi University Medical School run by the Germans, was moved to Wuhan city to combine with the Wuhan Medical College. The Shanghai Medical College—later named Shanghai First Medical College—and a military medical college remained in Shanghai. Similar reallocations were done in other parts of our country. Through these measures, medical colleges were more reasonably distributed for the convenience of students, and the teaching staffs were strengthened so that more students could be admitted to these colleges. Later on, as the teaching staffs grew, some medical colleges were assigned the duty of establishing new schools. At present, there are 116 medical colleges in our country, and every province has at least one medical college. The total number of medical graduates since liberation is 350,000. This is 37 times that of graduates for the 19 years (1929-48) before the liberation.

The second measure taken in the reform of medical education was the formulation in 1954 of a unified system for medical education. The applicants for admission to medical colleges should be senior middle school graduates. They should take a national entrance examination and on passing were admitted to the schools according to their choice. The length of schooling was five years in most medical colleges, and six years in a few key colleges. One medical college, de-

voted to the training of scientific researchers, offered an eight-year course. Seven specialties were offered in the medical colleges, namely, general medicine, public health, pediatrics, dentistry, pharmaceuticals, traditional Chinese medicine and traditional Chinese pharmacology. In each specialty, the curriculum and the number of hours for each subject were the same in all the colleges. The senior teaching staffs of different medical colleges were organized to write textbooks for all medical students. In this way, there is unification and elevation of the standard of medical education.

The third measure taken in the reform of medical education was the development of primary and secondary medical educations so as to make up for the deficiency of medical personnel. In secondary medical schools, there are courses for 10 specialties, namely, general medicine, traditional Chinese medicine, public health, maternity and child health, dental technician, nursing, midwifery, pharmacy, Roentgenological technician and laboratory technology. The secondary medical schools take junior middle school graduates and offer a three-year course. In the last few years, as our country is gradually making secondary education universal, some secondary medical schools take senior middle school graduates and offer a two-year course. There are now 435 secondary medical schools with 760,000 graduates in the last 29 years.

Since 1965, we started to give primary medical education, i.e. to train barefoot doctors and health workers. The "barefoot doctors" are young farmers, usually junior middle school graduates. They learn for three-six months the general medical knowledge and technics, and they are taught to diagnose and treat 20-30 kinds of common diseases. Refresher courses for a variable length of time are given to the barefoot doctors in slack seasons in order to gradually improve their knowledge and ability. Now there are about 1,800,000 barefoot doctors with two-three in each production brigade. In production teams, there are health workers who are also young farmers, trained to give primary medical care. There is a total of about 4,000,000 health workers in our country.

The Integration of Traditional Chinese with Modern Medicine

In China, there is a traditional medicine with a history of more than 2,000 years. It has its own medical philosophy and possesses very effective therapeutic measures and medicinal materials, particularly herbs. The traditional medicine and the modern medicine which was later introduced to China from the West did not compliment, but rather were antagonistic, to each other. At the time of the liberation, the traditional doctors far outnumbered the modern ones. According to the statistics of 1950, there were 41,400 doctors graduated from medical colleges, while the number of traditional doctors was 286,000. As the traditional doctors formed a force not to be ignored, to unite the doctors of the two schools became an important task in our country.

Much work has been done in consolidating the doctors of the two schools. First, they are taught to re-

spect and learn from each other, to make up for each other's deficiencies. The traditional doctors sit side by side with the modern doctors to render medical services and discuss medical problems. In our medical colleges, not only the various disciplines of modern medicine, but also the traditional medicine, including its basic theories, pharmaceuticals, acupuncture and moxibustion are taught, and in all the clinical subjects, traditional Chinese methods of treatment are included. In addition, colleges of traditional Chinese medicine were established, the early ones being founded in 1956 in Peking, Shanghai, Canton and Chengtu. At present, there are altogether 24 colleges of traditional Chinese medicine. In these colleges, 70% of the time is spent to teach traditional medicine, and 30% modern medicine, with emphasis on the preclinical subjects. The qualification of students and the length of schooling are the same as colleges of modern medicine.

In 1956, an Academy of Traditional Chinese Medicine was founded under the jurisdiction of the Ministry of Health. In this Academy, well-known traditional doctors are engaged in the study and systematization of traditional medicine, and they pass on their knowledge and experiences to the younger generation. Under the Academy of Traditional Chinese Medicine, there are institutes of the theory of traditional medicine, the traditional Chinese pharmacology, acupuncture, moxibustion and channels, etc., and there are also research hospitals. In these institutes and hospitals, there are laboratory facilities, and the theory and practice of traditional medicine are studied with modern scientific methods. In most of the provinces, there are institutes and special hospitals for traditional medicine.

Since 1958, two-three-year postgraduate courses have been offered by the Academy of Traditional Chinese Medicine and some traditional medical colleges. The participants in these studies are mostly experienced doctors of modern medicine, some being medical professors. When they possess the knowledge of medicine of the two schools, they are in a position to do research work with the combined traditional and modern methods.

Fruitful results have been obtained when the combined methods are used. Take acupuncture analgesia as an example. When the doctors of the modern school learn and gain the experience of treating pain with acupuncture, they utilize pain-alleviating effect for operations to replace anesthetics. Since 1958, acupuncture has been used for more than two million operations, including those of great magnitude, such as intracranial procedures, pulmonary resections and open-heart surgery with the help of extracorporeal circulation. Admittedly acupuncture analgesia has its drawbacks, as there are cases with incomplete alleviation of pain, muscular spasm and reactions to visceral tractions; however, it is advantageous to patients in shock, allergic to anesthetics or too weak to stand general anesthesia.

The treatment of acute abdomen with the combined methods of traditional Chinese and modern medicine has significantly reduced the percentage of patients re-

quiring surgical interventions. For cases of gastric perforations, acupuncture may have the effect of reducing pain and facilitating spontaneous closure of perforation, and medicinal herbs counteract on infections and enhance peristalsis of the gastrointestinal tract. In some cases, cure may be obtained by these measures, while in others, gastrointestinal decompression and antibiotics may have to be added. In about 30% of gastric perforations, operations are required. In cases of choledocholithiasis, stones may be purged out by traditional drugs in about 60% of cases, and this figure is raised to 90% if the treatment is given at the acute onset. For renal stones, there is a success in about 70% of cases by oral medication, and it is still effective in about half of the cases with stones bigger than nine mm. in diameter.

The application of the combined method in the treatment of fractures of bones has broken free from the conventional policy of complete immobilization of fractured ends of bones. By the use of the short splint, not including the joints above and below the fracture, it allows a certain degree of movement of joints, and functional exercises can be started soon after operative reduction of fractures. Compared with the long immobilization with plaster-of-Paris cast, the time for bony union and functional recovery can be considerably shortened.

The Control and Extermination of Communicable Diseases

Guided by the principles of "putting prevention first" and "integrating the health work with mass movement," and particularly after the patriotic health movement in 1952, we have periodically mobilized the mass to eliminate the four pests, i.e. flies, mosquitoes, bedbugs and rats, and educate people to cultivate hygienic habits. Particular attention has been paid to manure disposal and avoidance of water pollution in rural areas. Preventive inoculations have been enforced against some infectious diseases. With these measures, many infectious diseases and some parasitic diseases have been under control. Cholera, smallpox, plague and Leishmaniasis are practically wiped out. The incidences of epidemic encephalitis B, measles and poliomyelitis have been greatly reduced. Diphtheria occurs only sporadically. The campaign against schistosomiasis japonicum has been successful, with 7,500,000 patients cured after treatment, and 9,900,000 square kilometers of land originally infested with snails which are the intermediate hosts of schistosome japonicum cleared. At present, there remain 2,500,000 patients and 3,000,000 square kilometers of infested land. It is still a difficult task to completely eliminate this parasitic disease.

We haven't seen any case of venereal diseases in clinics for many years. As ECG vaccine is given as a routine to newborn babies in cities, and as most of our people enjoy free or cooperative medical care, the incidence of tuberculosis has dropped remarkably.

When infectious and parasitic diseases are on the decline, cardiovascular diseases and cancers head the list of our annual mortality rate. The infant mortality

in Peking before the liberation was about 20%, and now it has dropped to 12%, of which 0.6% died of infectious diseases.

Medical Research

In 1956, our government issued a call to march towards the development of science and technology and formulated a long-term plan for scientific research. In the medical field, the Academy of Medical Sciences was organized in 1957 as an important institution for medical research directly under the jurisdiction of the Ministry of Health. Now, under the academy, there are 19 research institutes which include basic medicine, preventive medicine, clinical medicine and materia medica. The duty of the Academy of Medical Sciences is not only to run its own institutes, but also to help the Ministry of Health to organize and coordinate the medical research work of our whole country. In many provinces, there are medical research institutes under the administration of the local government. All medical colleges also undertake research work, particularly the key colleges, which have the dual responsibility of teaching and research.

In the field of preventive medicine, extensive epidemiological surveys have been done on infectious, parasitic and some endemic diseases, such as goiter. In the last 10 years or so, the epidemiological studies have included noncommunicable diseases, such as cardiovascular diseases and cancers.

Carcinomas of esophagus, liver and nasopharynx are common in our country, and they have their patterns of geographic distributions. Specialists of multiple disciplines have been organized to have cooperative pilot studies in regions with high incidence of cancers. Epidemiology and possible carcinogenic factors are investigated, and early discovery, diagnosis and treatment of cancers are emphasized. Such studies have been carried out in Linhsien, Honan where the incidence of esophageal carcinoma is particularly high. As a result of the survey, many early symptomless cases were discovered, and operations on these cases yielded a five-year survival rate of over 90%. The five-year survival rates for stage I cancer of uterine cervix and stage I cancer of breast are 95-100% and 95% respectively. Besides doing pilot studies, we have made a nationwide cancer survey since 1975, and in three years' time, we have completed this survey and charted a map of geographic distributions of cancers commonly seen in China.

Similar work has been done on cardiovascular diseases. Pilot studies have been made in factories, countryside, plateaus and pastoral areas. Epidemiological surveys are made on hypertension, coronary diseases and stroke, and preventive measures are given to these diseases. In many of these investigated areas, there has been a decrease in the morbidity of hypertension and stroke. According to incomplete statistics covering 11 provinces, the incidence of hypertension and coronary diseases are 5.7% and 4.1% respectively.

In labor hygiene, following the improvement of labor conditions and environment, there has been a marked drop in the incidences of silicosis and indus-

trial poisonings such as that of lead, benzene, mercury and organic phosphorus. In environmental hygiene, we have established a preliminary monitoring system, and have made surveys on our main river systems such as the Yellow, Yangtze and Songhua Rivers, and the atmospheric air in some of our cities. Studies have also been made on the concentrations of cadmium, mercury, arsenic, chromium and fluorine in the environment. These studies give valuable data for formulating our policy on city planning and environmental control. In nutrition and food hygiene, we have made extensive analyses of our principal foodstuffs and a nationwide survey on the nutritional status of our people. Methods for detecting common food poisonings, chemical or biological, have been established and preventive measures taken. Now the incidence of food poisoning in our country has been lowered.

In the field of clinical medicine, besides the improvement in treating diseases by the combined traditional Chinese and modern medicine as mentioned previously, some achievements have been made in other fields as the treatment of extensive burns and reimplantation of completely-severed limbs.

The degree of success in rescuing patients with extensive third-degree burns is the earmark of one's ability in the management of such an injury. In 1966, in the Shanghai Ruijin Hospital, a patient with a third-degree burn covering 90% of his body surface was successfully treated. The eschars were excised in stages, the skin grafts were taken repeatedly from the scalp and the burned areas were temporarily covered with large pieces of homografts with multiple perforations into which seeds of autografts were inserted. Since then, more cases of a similar nature have been treated with success. In the period 1966-75, 29 of 64 cases of extensive third-degree burns covering more than 50% of their body surfaces were cured, the survival rate being 45.3%. We have now on record of successful treatment of seven cases with third-degree burns involving more than 90% of body surfaces, and in one it was 94%. Intensive studies have been made in our country in combating shock, preventing infection, skin-grafting and maintaining the nutritional status and balancing the metabolism of the burned patients.

Since the first successful reimplantation of a completely-severed forearm in 1963, an experience of more than 1,000 successful reimplantations of various parts of extremities have been reported. In 1971, we reported the first case of grafting a severed left foot to the proximal end of a severed right leg in a patient with severe injury of both extremities. When a segment of extremity is diseased or injured, such as a tumor of low malignancy, electric burn or severe segmental injury, we have resected the pathological or damaged segment and reunited the extremity. The first successful operation of this type was done in 1966. In the same year, we started to use the second toe of the patient as a free graft to reconstruct his lost thumb with success. In 1973, successes were scored in free muscle and free skin graftings, and, in 1977, free graftings of the fibula with its accompanying blood vessels. After the microsurgery technique was used in 1973 for reimplantation

surgery, the rate of success for reunion of completely divided fingers reached a new height, being over 90%.

In the field of pharmaceuticals, we have known the natural resources of more than 5,000 kinds of medicinal plants, and have cultivated more than 100 kinds in large areas. Over 30 kinds of tropical medicinal plants, which had to be imported formerly from other countries, are now grown on our own land. In recent years, medicinal fungi such as ergota, ganoderma, gastrodia, poria and grifola have been cultivated not only in farms, but also in factories through fermentation. Chemical analyses and systematic pharmacological studies have been made in more than 200 kinds of medicinal herbs, some constituents of which being found highly valuable. The extraction of gossypol from cotton seed oil is found to have contraceptive effect for males, and this has been on clinical trials in several thousand cases.

In regard to synthetic drugs, we are able to manufacture about 700 kinds of them. This has entirely changed the backward situation of relying almost entirely on the importation of drugs in old China. More than 50 kinds of antibiotics are manufactured in our country by biological or semi-chemical syntheses. In 20 of the 30 kinds of antibiotics synthesized biologically, the producing organisms are isolated from our soil. Creatmycin for B. Coli infection is a new antibiotic made in China.

The Future

Great advances have been made in our health work with respect to the health delivery system, medical edu-

cation, the integration of traditional Chinese with modern medicine, the control and extermination of communicable diseases and medical research, but compared with what has been achieved in advanced countries, we lag far behind. For every thousand people, we have only 1.88 hospital beds and 1.03 doctors. Many infectious and parasitic diseases still exist in China. We are still faced with many medical problems, the solution of which naturally depends on our own effort, but we must learn the good experiences of other countries; 38 years ago, I came to this great country for postgraduate study. I could never forget the happy days I had in the University of Michigan Hospital, where I was trained as a thoracic surgeon by Professor John Alexander, Professor Cameron Haight and many others. I could neither forget this beautiful city—Baltimore—where I had the chance to observe the Blalock operation for blue babies performed by Professor Alfred Blalock himself. I have learned so much from my American professors and colleagues in the past, and now I come to learn again.

I wish to take this opportunity to bring you, medical colleagues and friends of the US, greetings and friendship from Chinese medical circles and the Chinese people. I wish to express my hearty thanks to members of the Maryland medical society for giving me this platform and I want to thank you all for your patience. □

DOCTORS IN THE NEWS:

E. Paul Coffay, MD has been named Vice President for Medical Affairs at St. Joseph Hospital in Towson, MD.

Springwood AT LEESBURG

A private psychiatric hospital in the Virginia countryside, 35 miles west of Washington, D.C.

- Individualized and confidential care in a comfortable therapeutic environment
- Suitable for the most demanding patients including professionals, corporate executives, government officials, and their respective family members
- A broad range of therapeutic modalities, including a specialized program for the treatment of alcohol- and drug-related problems

Accredited by the Joint Commission on Accreditation of Hospitals (JCAH)

Brochure available upon request

Medicine Needs Another Mencken

By JEAN-MAURICE POITRAS, MD, FAAP

Dr. Poitras can be contacted for reprint and other data at 107 Edgerton Rd., Towson, MD 21204. He is also in the Department of Emergency Medicine at the North Arundel Hospital at Glen Burnie, MD.

Introduction

Henry Louis Mencken (1880-1956), called the Sage of Baltimore among many other names not always so complimentary, was one of the most renowned and prolific writers of the first half of this Century. He had an overwhelming love and respect for medicine and the medical profession. He could see their faults, but forgave them with the fervor of a doting father.

As well as being one of the truly great writers of the first half of this Century, he was probably also one of its greatest practicing hypochondriacs. As a result, he knew professionally and as a friend nearly every renowned doctor of the Johns Hopkins and University of Maryland Medical Schools and Hospitals.

The medical profession needed his fighting spirit and loving reverence, and he was ever-ready to join the fray. He aided and abetted them whenever he could. He fought their battles with the vigor of knights of old. He attacked and assailed their enemies and was forever in the forefront in the battle against all quackery. He constantly protected and fought for them against bureaucratic misadventures, bungling and incompetency. His pen was a constantly-moving rapier ever jabbing and thrusting.

The following is a short article, labeled as never having been published, from one of the file boxes in the Mencken Room of the Enoch Pratt Free Library in Baltimore clearly demonstrating how much the medical profession today could use another man of

Mencken's caliber and proficiency. The article is undated, but was probably written in the 1930s and is as appropriate today as it was then. Mencken wrote hundreds of published articles which were pro-medicine, anti-quackery and anti-meddling bureaucracy.

Read the article and lament that today we have no knight-errant with upraised banner, no famous scribe to write and publish articles such as the following as did Mencken in his heyday.

Mencken's Prophetic Words of Wisdom

"Belief in quacks is always accompanied by hostility to honest men. It is not by accident that the American Medical Association is one of the principal butts of the whole rabble of Communists, New Dealers, social workers and so on. The medical brethren, during the past two generations, have justified their existence more than any other group of men. They have not only taken an active and effective hand in the progress of medicine as a science; they have also greatly improved it as a profession. The old days of Class C medical schools are gone, and there has been an immense improvement in the operation and usefulness of hospitals. All this the medical men have achieved on their own motion, and to a large extent at their own cost. No other profession has gone so far, or even half so far, in improving its professional competence and social utility, yet, its sole reward is an organized campaign to make it suspect and even infamous, and to turn its members into slaves of the state. In this campaign, all branches of the government have taken a hand—the executive, the legislative and the judicial—and all varieties of uplifters. The same movement, though in less dramatic form, is visible in other fields. The newspapers are denounced, not for their defects, which are plentiful, but for their increasing merits—for example, their effort to report realistically the operations of the governmental bureaucracy and of such groups as that of the labor leaders. When they go along docilely in foreign relations, they are praised, but when they try to tell the truth, they are defamed."

You might know Jack Isaacson. Maybe you've had occasion to use his financial expertise. He's helped a lot of physicians with sound advice and professional loans.

Jack's with American Bank now. Jack's knowledge of the medical profession, his experience with solving the financial problems of a practice, make him a valuable asset in our business. With him around, American Bank can help you meet the costs of starting a practice, expanding, remodeling or buying new equipment. And he can arrange terms to suit your individual situation and the growth of your practice.

Our Emerging Technology—How Much is Enough?

By GEORGE R. DUNLOP, MD

For reprint and other data, contact Dr. Dunlop at 65 Elm St., Worcester, MA 01609. Dr. Dunlop is a Past President of the American College of Surgeons.

One of the most difficult and disturbing decisions that faces our society today is the determination of what portion of our resources should be spent on medical care.

England has never faced up to this decision. Instead, she has simply cut back on medical services by increasing the waiting lists until now over one-half million persons are waiting up to four years for elective surgery.

As Elliott Wickes of Michigan State University has pointed out, "People will always want to consume health care that holds out the promise of longer, healthier lives and relief from pain, and since technological progress seems constantly to expand the capacity of medicine to fulfill that promise, the demand is virtually insatiable." Not only is the demand for medical services a bottomless pit, but as Rene Dubois has aptly put it, "To ward off disease or recover health, man as a rule finds it easier to depend on healers than to attempt the more difficult task of living wisely."

To compound the problem, there has been an explosion of emerging technology which gives a physician the capacity to explore, test and monitor most of our bodily functions. This technology is cost-raising rather than cost-saving and has captured the eye and the imagination of most of our younger colleagues. In their enthusiasm it is not unusual for them to confirm a diagnosis by four or five separate modalities, each at a considerable cost to the system.

Not only do we order these support services in a lavish manner, but we are usually unaware of their costs. We are too willing to embrace a new technology before it has been carefully tested and evaluated. Our engineering and scientific community can actually produce new technology faster than the profession can evaluate it.

It took 112 years to implement the principles of photography. Transistors were in production three years after their first experimental demonstration. Hospitals purchased 2,500 machines for freezing the stomach before this treatment was discredited by a careful study of the American Society for Gastroenterology.

You are all aware of how costs have escalated, yet life-expectancy has increased only three years since 1950. Will pouring more money into the system increase the health outcome of the American people? Are we reaching an endpoint and will society have to accept more responsibility for their health by changing their lifestyle?

The increased costs of medical care has become the concern of industry and the taxpayer. Medical costs are production costs. Medical costs raise State and Federal income taxes. Our practice methods and priorities will come under increasing public scrutiny.

If the current trend continues, the cost of health care for the elderly will exceed \$2 trillion by the year 2000.

In their concern, business and government are willing to try any experiment that promises to reduce health care costs. Peer and Utilization review, HMOs, PSROs and second opinion programs are but a few examples.

Dr. Sydney Wolfe's Health Research Group, a subsidiary of Ralph Nader's Public Citizens Organization, is urging HEW Secretary Joseph Califano to ask Congress to add to pending hospital containment legislation a requirement that hospitals participating in Medicare and Medicaid put all hospital-based physicians on salary, including physicians now billing patients directly.

Fired by our emerging technology, the increasing demand for our services with the attendant costs makes it imperative that we know more about the costs and results of these services. The dearth of data for assessing these problems has been called by Elliott Richardson "A nearly fatal deficiency."

We are fast-approaching a situation where a variety of health programs and operative procedures are bitterly competing for the diminishing health care dollar.

Can a profession linked only by its concern for the sick and injured which has traditionally involved itself with the quality—and not the cost—of medical care be expected to provide the necessary answers to a concerned public?

Let us take a closer look at the problem.

The detection of a case of pulmonary embolism in young people is about \$1,000 if a lung scan is used on all patients. If only a subgroup is scanned, the cost drops 40% to \$600, but 5% of the cases are missed. Under these circumstances, the cost of finding the last patient with pulmonary embolism is \$8,500. With an older and more mixed population with pulmonary embolism, the cost is \$2,000 per patient. The cost of identifying and treating, and thereby saving, a life is \$11,300.

The best available data on elective herniorrhaphy indicates that this operation does not prolong life in the elderly (it may or may not improve the quality of life). What has changed the picture over the past 30 years is the surgeon's ability to reduce the mortality of the emergency operation. The skill of surgeons has eliminated the need for the elective operation to save lives in the elderly.

The American hypertensive population numbers 23 million, 90% of whom have an unidentifiable cause of their hypertension and 10% have an identifiable cause. The average cost of detecting a patient with renal vascular disease is approximately \$2,000 and the average cost of curing one is seven-eight times higher. The total cost of discovering patients with renal vascular disease in the American hypertensive population is in the order of billions of dollars and the cost of the surgical cure is \$15,000. These costs result in changes of less than 1% in mortality and morbidity of our hypertensive population.

Elective hysterectomy and oophorectomy in patients in good health will usually result in the increase in life-expectancy of approximately two weeks, primarily by precluding future cancer of the uterus and ovaries. For the patient who is less healthy or older, for example a 50-year-old woman with moderate hypertension, life-expectancy is shortened by elective hysterectomy as a result of the increased risk of surgery. The principle benefits of elective hysterectomy it is assumed are improvements in the quality of life. (Bunker, Barnes and Mosteller.)

Available data on the results of hemodialysis and renal transplantation indicate that 52-60,000 patients will be in treatment at the end of the 10th year at an annual cost of \$700-800 million.

Coronary bypass surgery poses another dilemma to society. What is the optimal medical care for the individual patient may not be optimal when society collectively considers what it is costing. The cost of a coronary bypass operation is between \$10-15,000 per procedure. If the operation were to be performed on only half the potential candidates for surgery, the cost would be \$20 billion, nearly 17% of all current health expenditures and that is only a single procedure employing existing technology.

The Commission on Professional and Hospital Activities compared the effectiveness of sample hospitals with and without coronary care units. The survival rate was 7% better in those hospitals with such units; but if each of the 7,000 hospitals in the United States had 10 such beds, it would cost \$2.5 billion or about \$70,000 per patient.

Of the various modalities that we use, intermittent positive pressure breathing stands on the most shaky scientific ground. Morton Gold of the Department of Anesthesiology of the University of Miami School of Medicine states that the "Overwhelming evidence against IPPB therapy in the surgical patient calls for its abandonment and the substitution of other approaches. The head of respiratory diseases at the Medical School of the University of Massachusetts believes that IPPB has "Never done anything for anyone."

Another issue that needs our attention is the routine annual physical examination. Industry spends millions of dollars on the annual checkup. Could these dollars be better spent on other health programs? Dr. Richard Spark of Harvard is quoted in the *New York Times* as asking this question after reviewing the data of the Kaiser Permanente program: "Why do people who submit to these periodic examinations have the same disease disability and mortality rates as those who seek advice only when they feel sick?"

Dr. Catherine Boucot and her group at the Medical College of Pennsylvania screened 6,136 males over 45 with chest X-rays every six months for 10 years. Initially, none of the men had symptoms of lung cancer. Over the course of the program, however, lung cancer was discovered in 112 of them. These men were given immediate and sustained treatment, but only 8% survived over five years. In the meantime, we have hospital staffs who require routine chest plates on all children prior to tonsillectomy.

Last year in Massachusetts, the cost of support services went up 27% and Blue Shield reserves dropped from \$27 million to \$500,000, whereas physicians' fees and hospital costs went up only 12 and 14% respectively. At the Massachusetts General Hospital X-ray, laboratory and drugs cost the patient on the average of \$127 a day.

Grener and Liptzen reported on a study published in the *Annals of Internal Medicine* analyzing the data of laboratory studies at the University of Rochester Medical Center. The data indicated that laboratory costs were rising faster than the cost of other patient care functions. The average number of tests per patient were 38 for chemistry and 18 for hematology. Tests for blood urea nitrogen, serum electrolytes and a complete blood cell count were repeated every two or three days. The complete blood count was ordered as a package 85% of the time. Urine cultures were ordered more frequently than a urinalysis. Patients in a 15-bed intensive care unit underwent more than twice as many laboratory studies as patients not in the unit. One patient with pulmonary disease in 17 days had 510 tests or an average of 30 a day at a cost of \$3,557. Serum electrolyte examinations were obtained 60 times for \$530, and an X-ray film of the chest was ordered 20 times for \$696. Blood gases were essayed 38 times always with the same outcome, severe hypoxemia. The authors demonstrated that at times the results of ordering tests made little difference to those who did the ordering. Thus, when reports of differential white cell counts for 37 patients were purposely withheld, there was no occasion when the laboratory staff was asked for the report. From an economic viewpoint, all the testing had a strong impact. During the study, the average hospital bill was \$1,818, of which one-fourth was for laboratory tests. These findings led the authors to initiate an educational program about excessive testing and its cost by the development of rational guidelines for optimal use of laboratory procedures, gratifying improvements were obtained.

Another appalling situation in the United States is the fact that we surgeons have so little knowledge of the cost of the support services we order for our patients. An experiment was conducted at the Southern Illinois University School of Medicine involving the effect of price knowledge on the ordering of laboratory tests. A group of medical students with price knowledge ordered an average of \$60 worth of laboratory tests, while those without price knowledge ordered an average of \$111.40 worth of laboratory tests. As responsible physicians we should urge our hospitals to make this information readily-available and, more importantly, we must address the question as to what constitutes an acceptable amount of laboratory testing.

Recently, the President of the Massachusetts Medical Society, Dr. John J. Byrne, wrote to all the hospital administrators in Massachusetts asking them to distribute copies of the charges for laboratory, radiology and other services to all physicians and to send physicians copies of the itemized bills including a breakdown of laboratory and X-ray services. He also urged that these bills be used as source material for education seminars of staff and administration and suggested that this activity might be structured as an ongoing staff responsibility.

Dr. Henry L. Paige, Professor of Medicine at Vanderbilt Medical School, reported an increase in laboratory tests in three years from 2,700,000 to 3,800,000 due, he reports, to the fact that

more physicians, particularly interns and residents, are ordering more and more tests.

I hope that I have convinced this audience that the evidence suggests that we as a profession are showing an increased tendency to rely heavily on an increasing number of support services of whose cost we are unaware and that this trend is threatening the stability of the health financing system. Furthermore, I hope I have raised the question in your minds as to the wisdom of unlimited financing of categorical diseases without national priorities.

As the SMAs move to a new generation and the number of candidates for cardiac pacemakers and coronary bypass grafts increase with the expansion of our geriatric population, the need for priorities become increasingly evident.

The average monthly cost of a pacemaker is \$102. The current cost per unit is about \$900, but the new, improved model with an extended life will cost nearer \$2,000. It is estimated that the cost of pacing the heart is 0.003¢ per heartbeat.

One of the more recent examples of the threat of new technology to the health financing system is the technique of computed tomography. In the past three years, over 300 CT scanners have been installed in the US at a cost of some \$200 million with several hundred orders waiting to be filled. It is estimated that by 1980 there will be approximately 2,500 CT scanning units in the US. As a result of personal inquiry, I find that Canada has about 10.

Currently a CT scanner costs between \$310,000 and \$625,000. These are being purchased or leased and installed in hospitals, doctor's office and even shopping centers. By August, 1976, 15 such scanners of the slightly more than 300 in the US were in physician's offices, and as can be seen, our country is threatened with an over supply which stimulates inappropriate and inefficient use.

The operational cost of a CT scanner is approximately \$400,000 per year. Government—through our planning councils and many of our national professional colleges—have concerned themselves with criteria, not only for the purchase of CT scanners, but for their utilization as well; however, there is little uniformity in these standards. At present, five states have no CT scanners. California has 57, Florida 27, Texas 19 and Ohio 15.

The total body scanner, after emerging through a series of new generations, may be even more effective as a diagnostic tool. We are fast approaching a point where we must recognize that the use of new technology is not necessarily justified simply because it will work. Technology's geometric growth can threaten to generate services and costs rather than to reduce need through controlling illness.

We are now capable of developing lifesaving methods well beyond our capacity to pay for them. Thus, new medical triumphs create new moral and economic issues.

Eli Ginzberg, Professor of Economics at Columbia University, stated: "Let us face up to the fact that we have never had, we do not have now and we will never have enough money to practice the best type of medicine that we are capable of practicing for all the people of the country. We live in a world of limited resources and the public in the last analysis must decide through legislature, through insurance and through direct payments how much of its total budget it is willing to allocate to health."

Dr. David Owen, the Labor Party Minister in charge of the National Health Service in England, said in a recent interview, "The Health Service was launched on a fallacy. First, we were going to finance everything, cure the nation and then spending would drop. That fallacy has been exposed. Now, we must recognize that no country, even if they are prepared to pay the taxes, can supply everything."

We must begin the long and painful reassessment of so many of the services that have become routine in our professional lives and we must assure ourselves that they will stand up under the scrutiny demanded by these modern times.

Such problems as the cost-effectiveness of our medical screens the order of our national medical priorities cannot be made by the professional unilaterally. We have a tremendous research capacity and tradition of problem-solving supported by clinical trials, pilot studies and data-gathering. We have a communication system strengthened by our journals and our meetings, but this is not enough. We can determine the medical effectiveness

of a procedure and pass judgment on the medical necessity of its use. The allocation of our medical resources is another matter. Here we are dealing with serious social problems and we must inform ourselves and be willing to join with representatives of business, labor and government and the consumer in answering these difficult questions.

My objective is not to discredit medicine's effectiveness in restoring health to the critically-ill and injured, but to point out that if society, including the medical profession, established reasonable health priorities and if we are wise in the allocation of our medical resources, the system may not need to default to the stringent and often unrealistic controls of a Federal bureaucracy.

The individual physician, in his efforts to save the individual patient, cannot be expected to consider the allocation of resources. It is a human impossibility to reckon costs in the care of the sick at the bedside. It should be abundantly-clear that, in this situation, only the reckoning of the medical benefit is permissible. No logic, no economic considerations must allow us to imagine that a case can be made for the medical profession rationing human lives.

The only way out of this dilemma is to make the decision about what services to provide *prior* to the point at which they are needed and prior to the purchase of the expensive technology. *Only then* is it possible to do an objective analysis of the relative benefits of alternate uses of our resources.

Finally, it is important that the profession direct some of its impressive research and investigative capacity to the field of medical economics, thereby placing us in a better position to advise the public as this nation searches for answers to our health care problems.

In addition to monitoring the extreme ends of the practice spectrum, we should concern ourselves more with its center, where most of us practice, recognizing that in this area single daily extravagances can be more costly than those occurring at either end.

The challenge is before us and I hope that you will take a new look at the surgical environment in which you work. Select your support services prudently, direct your investigative capacity toward finding the answers to some of these questions I have raised. Become informed and let your voices be heard in advocating the prudent use of our health services. Convince your students and residents that clinical judgment can in many instances be more important than laboratory reports. Convince them that if they squander our resources on support services, they threaten the very foundation of the fee-for-service system and build the pressures for a Federal takeover of their professional lives; recapture some of the community leadership in these matters that is a part of our heritage and, finally, we must be prepared to join forces with all segments of society in solving these problems of ours within the private sector. □

"WE SERVICE WHAT WE SELL"

A Model for the Use of Predigested Collagen Amino Acid Liquid Formula Feeding as an Adjunct to a Comprehensive, Medically-Supervised Weight-Reduction Program

By PAUL A. DEVORE, MD and ALAN B. BERGER, RPh

For reprint and other data, write Dr. DeVore, at Suite 211, Presidential Building, 6525 Belcrest Rd., Hyattsville, MD 20782. Dr. DeVore is Clinical Instructor in the Department of Community and Family Medicine at the Georgetown University School of Medicine.

Introduction

This paper reviews the scientific basis for so-called protein-sparing therapy as an adjunct to a hypocaloric weight-reduction diet, as well as discussing the hazards associated with this sort of dieting regimen. A Model Program designed to be implemented at the level of the primary care physician is presented, along with comparative short-term weight-loss results among similarly-matched groups of patients who followed essentially the same regimen except for the closer monitoring afforded by the Model Program. One of the unique features of this Model Program is that it utilizes the special talents of a pharmacist in a "team approach" to the medical management of a weight-reduction program.

Reports in the lay press have emphasized the hazards of unsupervised use of commercially-available, predigested collagen amino acid liquid formula preparations. Among the hazards reported are hypokalemia with associated cardiac arrhythmias and postural hypotension due to change in body composition while attempting to follow this type of weight-reduction diet.

Protein-Sparing Outpatient Fasting

The theoretical basis for this new form of diet therapy is the "Metabolic Fuel Regulatory System" described by Flatt and Blackburn in 1974.¹ This theory places insulin at the center of an interrelated metabolic system of supply-and-demand that explains many of the problems associated with the fasting state and weight-reduction in general. All ingested foodstuffs induce an increase in circulating insulin; however, dietary carbohydrate induces a greater degree of insulin response than does dietary protein, with dietary fat exerting an intermediate influence on this stimulation of insulin secretion. Furthermore, insulin has a "fat-storing" effect on adipose cells that is counterproductive to the dieter's goal of "fat mobilization." This latter term refers to the mobilizing of triglyceride (the storage form of excessively-eaten carbohydrate) from the fat cell, with its breakdown into free fatty acid and glycerol. Not only does insulin promote the storage of excess caloric food intake within adipose cells, it also actively blocks this breakdown of triglyceride at the level of the adipose cell. Therefore, the ideal weight-

reduction diet should minimize insulin secretion so that the mobilization of free fatty acid from fat depots can be maximized during a hypocaloric dietary regimen. Flatt, Blackburn and Bistrian¹⁻² with their research on both the fasting state and hypocaloric, zero-to-very low carbohydrate diets have made the following observations: First, dietary intake of protein in excess of the usual RDA recommendation will indefinitely postpone the appearance of negative Nitrogen balance in patients following 300-500 kCal per day weight-reducing diets. Prevention of this negative Nitrogen balance will likewise prevent the rapid regain of weight observed after a subject discontinues a total fast and resumes eating even a 500 kCal per day diet. Secondly, these researchers felt that starvation ketosis associated with this sort of low carbohydrate, hypocaloric diet was a harmless and desirable feature of the dietary program. It is harmless because it is unrelated to the pathological condition found in diabetic ketoacidosis, and merely represents an adaptation of the body to the absence of dietary carbohydrate. It is desirable because its appearance coincides precisely with the disappearance of appetite in the subject. The potentially-harmful side-effects of a ketogenic diet, such as the renal organic acid block (in order to preferentially excrete ketone bodies) must be monitored with periodic blood tests, serial ecg tracings and routine administration of 20-40 mEq. potassium per day. The organic acid block mentioned above creates a situation where an elevated serum uric acid occasionally occurs; however, episodes of gout in patients on this diet are not a problem, and these researchers do not recommend routine use of anti-gout medications for patients with serum uric acid levels under 12 mg%. Care must be taken during the reintroduction of carbohydrate-containing foods however, lest the kidney be flooded with urate from the elevated uric acid pool and acute formation of urinary calculi occur.

These researchers did not use predigested collagen amino acid formulas in their research studies. Instead, they used protein foods such as lean beef, fish and poultry as their source of dietary protein. Genuth et al published their clinical experience using a liquid formula feeding composed of a mixture of casein and glucose in treatment of obesity in 1974.³ Subsequently, predigested collagen amino acid liquid formulas containing either zero or trace amounts of carbohydrate began to be manufactured commercially. At first, these products were marketed exclusively to physicians and

pharmacists, but eventually were marketed by every conceivable form of commercial outlet. Finally, the popularity of the book **Last Chance Diet** assured the development of a very profitable market for the use of "the liquid protein diet."⁴ According to Blackburn, these collagen amino acid liquid formulas are a satisfactory source of dietary protein for individuals desiring to follow this sort of weight-reduction diet.⁵

Hazards of Protein-Sparing Modified Fasting

Figure 1 presents a list of potential hazards associated with this method of weight-reduction. The predictability of the occurrence of hypokalemia in these patients make it mandatory for all patients to supplement their dietary effort with 20-40 mEq potassium per day. It is the responsibility of the physician to make certain that patients comply with this regulation by monitoring serum potassium levels periodically. The kaluresis and naturesis associated with such drastic dietary restriction of carbohydrate creates a potential additive effect in hypertensive patients who are on antihypertensive medication. According to Bistrian, the magnitude of this diuretic effect" of the dietary regimen is equivalent to 50 mg. hydrochlorthiazide.⁶

FIGURE 1: Physiologic and Pathophysiologic Effects of Modified Fasting

(Adapted from: Bistrian B.R.: Biochemical and Medical Aspects of a Protein Sparing Modified Fast, Chapter 2, in Obesity, Blackburn, G.L. (Editor), Ctr. for Nutritional Research, Boston, MA, 1977)

1. BLOOD PRESSURE
 - **diuretic drugs:** there is an additive effect in the magnitude of about 50 mg. hydrochlorthiazide; **non-diuretic drugs:** patients taking these drugs should be monitored closely for hypotension.
2. HAIR LOSS
 - is related to the temporary negative Nitrogen balance that occurs during the first one-two weeks on **any** hypocaloric (500 kcal/day or less) diet; it is a transient phenomenon.
3. MENSTRUAL FUNCTION
 - **pregnancy** — ketogenic diets are contraindicated in pregnancy because of the deleterious effect of ketonemia on the fetal brain.
 - **amenorrhea** — morbidly obese (Body Mass Index 42)* and significantly obese (Body Mass Index 27-42) females often experience a normalization of their menstrual cycle when dieting. Mildly obese females often become hypomenorrheic with **any** attempt at weight reduction.
4. INTERCURRENT ILLNESS
 - patients should be careful with the use of syrup vehicles as a hidden source of carbohydrates, as well as the possibility of a reduction in insulin requirements, along with the possibility of digitalis or lithium toxicity.
5. INTERCURRENT ILLNESS
 - myocardial infarction, coronary heart disease and cerebrovascular disease patients should beware of the sudden reduction in blood volume that can accompany the initial diuresis associated with this diet.

* **BODY MASS INDEX**—a term used for comparing degree of obesity among a group of subjects. It is obtained by dividing the square of height into the weight, using metric measurements.

This problem is intensified by the hypovolemia produced during the initial one-two weeks of all low carbohydrate, hypocaloric diets. These observations form the basis of our concern that these predigested collagen amino acid liquid formula preparations should only be used by individuals who are being carefully-instructed and monitored by a physician and pharmacist.

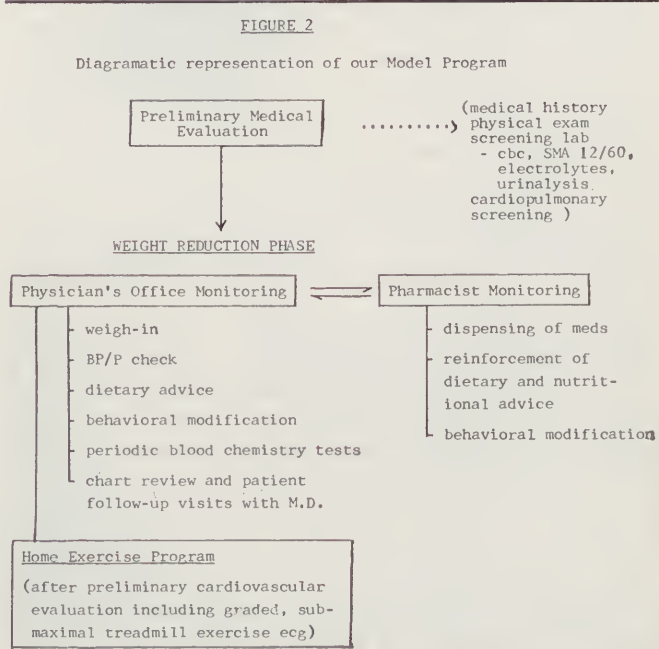

The physician monitors the serum K⁺ by means of periodic electrolyte determinations and monthly ecg tracings, looking for the characteristic electrocardiographic changes associated with hypokalemia. The pharmacist monitors the patient by reinforcing the necessity of them taking their potassium supplementation regularly.

Proposed Model Program

The authors have developed a program designed to administer and monitor an outpatient protein-sparing "modified fast" which fulfills the criteria for safety and effectiveness. The key to this program is that it incorporates the local community pharmacist into the scheme of delivery of this form of health care—in the same manner that the pharmacist interacts with the more traditional forms of health care delivery.

Figure 2 presents our Model Program in diagrammatic fashion. In this model, there is frequent communication between the physician's office and the pharmacist. The pharmacist serves much the same role as the physician's staff in terms of reinforcement of dietary and nutritional instruction. In this physician/pharmacist partnership, the pharmacist supplies an area of expertise that is unfamiliar to most physicians, namely the knowledge of the various brands of vitamin-mineral supplements, etc. In the authors' case, the pharmacist was instrumental in introducing certain types of nutritional supplements to our regimen.

In order to ensure patient compliance in this sort of comprehensive weight-control program, the choice of nutritional agents employed by the physician-

pharmacist team is extremely important. The products utilized should compliment the overall program rather than add to the possibility of treatment failure. It is imperative that the products used should be well-tolerated and accepted by the patient. We have developed a high rate of patient acceptance of our supplements by carefully choosing our manufacturing sources and employing those products which achieve the desired therapeutic effect with a minimum of patient side-effects and complaints.

The authors have personally inspected the manufacturing facilities of our predigested protein supplier. Only the highest quality gelatin is purchased for the manufacture of the liquid amino acid formula used in our program. The predigestion is achieved with the use of natural papaya enzymes. Tryptophane is added to the liquid formula in order to make a biologically-balanced product. A full-time chemist and bacteriologist is employed by the manufacturer in order to assure quality control in each lot of this liquid amino acid formula. We are currently using a carbohydrate and fat-free pineapple-and cherry-flavored liquid formula which has an excellent taste and is well-tolerated by patients' gastrointestinal tracts. The product uses saccharin as an artificial sweetener because sorbital has been observed to induce an excessive amount of gastrointestinal tract symptoms, especially diarrhea in patients attempting to utilize this sort of product as their sole source of dietary protein.

It is estimated that a total dietary intake of 2,000 mg. (55 mEq.) potassium is necessary to avoid hypokalemia while following this ketogenic diet. The amount of potassium supplementation required is determined by the amount of actual food the patient eats. Those following "Plan C" will obtain at least 25 mEq. K⁺ from dietary sources, so another 20 mEq potassium supplementation is appropriate for them. One K-Lyte tablet per day will accomplish this goal. Patients following Plan A and Plan B will require more supplemental potassium. In the interest of economy, we encourage patients to use a generic KCl preparation. Those patients who cannot, for one reason or another, tolerate 60 mEq. per day of the generic KCl liquid, are advised to take two-three tablets per day of K-Lyte. We have also used a complexed potassium supplement which supplies 99 mg. K⁺ per tablet. We have observed no instances of hypokalemia among those patients who follow Plan B or Plan C, but its use is reserved for those patients who cannot even tolerate the K-Lyte.

Vitamin and mineral nutritional supplementation adds to the safety of following such a restricted, hypocaloric diet. We utilize a vitamin-mineral-enzyme preparation, that, along with two Dolomite (calcium and magnesium) tablets daily, will supply the RDA for vitamins and minerals for our patients.

This sort of dietary regimen is obviously deficient in terms of available natural fiber. This would be true even if patients elected to obtain their dietary protein from food sources (beef, fish and poultry) instead of the predigested collagen liquid formula. We

have found that the addition of two tablespoonsful of natural miller's bran daily is effective in preventing constipation in our patients.

Patients who follow our program use certain educational materials⁷⁻⁸ as part of the comprehensive program. Personal responsibility is emphasized by avoiding the use of group sessions for patients. **Figure 3** summarizes the dietary program as it is presented to the patient.

During the first 11 months of 1977, 472 patients began our Model Program. No significant untoward side-effects have been observed thus far in any of our patients. It will take at least a two-year follow-up of these patients in order to determine if our Model Program is any more effective than any other program in terms of inducing long lasting maintenance of attained weight-loss; however, in an effort to evaluate short-term results in patients following our Model Program, we compared the weight-loss among the 30 subjects who started our Model Program during the month of July, 1977 with a similar group of 25 subjects who attempted to follow a similar, although less sophisticated weight-reduction program beginning in July, 1976.

Both groups of patients were followed from July 1st-Sept. 30th of their respective years. **Figure 4** summarizes

 - pulmonary function testing
2. **Dietary Regimen**
 - the goal of the diet is to furnish approximately 1.5 Gram protein/kg ideal body weight per day **and** to restrict dietary carbohydrate to less than 20 Grams per day.
 - The patient is given the choice of one of three "plans":
 - Plan A:** 1.5 G amino acid formula/kg ideal body wt.
 - Plan B:** 0.75 G amino acid formula/kg ideal body wt. + one "meal" consisting of 6 oz. lean beef, fish or poultry.
 - Plan C:** 10-14 oz. lean beef, fish or poultry divided into 2-3 feedings. No amino acid formula is used at with Plan C.
 - + raw vegetables (low carbohydrate) in small quantity.
 - + at least 1 quart non-caloric liquid per day.
 - + multiple vitamins and minerals including potassium, folic acid, calcium and magnesium.
3. **Monitoring of the Patient**
 - weekly office visit for weighing, dietary advice and low key behavioral modification.
 - use of a special textbook/manual*
 - encouragement in beginning a special home-study program in exercise and physical fitness.*

* information concerning these manuals can be obtained from the author.

FIGURE 4: Summary of comparison of weight-loss attained by 30 Model Program subjects and 25 subjects attempting to follow a weight-reduction regimen in 1976.

1976 Patients (7/1-9/30/76)		1977 Model Program (7/1-9/30)	
25	Number Starting	30	
(all female)		2 male; 28 female)	
36.7 years	Mean Age	36.5 years	
6.8 lbs.	Mean Weight-Loss	11.9 lbs.	
Age Distribution			
2	less than 20	2	
6	20-29	5	
8	30-39	12	
		(1 male)	
5	40-49	8	
		(1 male)	
4	50-59	3	
Distribution of Weight-Loss			
3	Gained Weight	1	
9	0-5.75 lbs. Lost	6	
6	6-9.75 lbs. Lost	8	
5	10-14.75 lbs. Lost	7	
0	15-19.75 lbs. Lost	5	
1	20-24.75 lbs. Lost	4	
1	25-29.75 lbs. Lost	2	
0	30+ lbs. Lost	1	

the results of these two comparable groups of subjects. The mean weight-loss of 11.9 lbs. for the 1977 Model Program subjects, (with a mean weight loss of 13.6 lbs. for those who attempted to participate in the home exercise program) compared to the mean weight-loss of 6.8 lbs. for the 1976 group of subjects speaks for itself regarding the effectiveness of our program.

Conclusions

The authors have researched, developed and implemented a comprehensive weight-reduction program that utilizes predigested, collagen amino acid formula feeding in a safe and effective manner. By prescribing one specific laboratory-tested brand of liquid formula, we have reduced the likelihood of untoward reaction. At the same time, we were able to encourage compliance by patients engaged in the use of this potentially-hazardous method of weight-reduction.

Tenuate®

(diethylpropion hydrochloride NF)

Tenuate Dospan®

(diethylpropion hydrochloride NF) controlled-release

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATION: Tenuate and Tenuate Dospan are indicated in the management of exogenous obesity as a short-term adjunct (a few weeks) in a regimen of weight reduction based on caloric restriction. The limited usefulness of agents of this class should be measured against possible risk factors inherent in their use such as those described below.

CONTRAINDICATIONS: Advanced arteriosclerosis, hyperthyroidism, known hypersensitivity, or idiosyncrasy to the sympathomimetic amines, glaucoma. Agitated states. Patients with a history of drug abuse. During or within 14 days following the administration of monoamine oxidase inhibitors, (hypertensive crises may result).

WARNINGS: If tolerance develops, the recommended dose should not be exceeded in an attempt to increase the effect; rather, the drug should be discontinued. Tenuate may impair the ability of the patient to engage in potentially hazardous activities such as operating machinery or driving a motor vehicle; the patient should therefore be cautioned accordingly. **Drug Dependence:** Tenuate has some chemical and pharmacologic similarities to the amphetamines and other related stimulant drugs that have been extensively abused. There have been reports of subjects becoming psychologically dependent on diethylpropion. The possibility of abuse should be kept in mind when evaluating the desirability of including a drug as part of a weight reduction program. Abuse of amphetamines and related drugs may be associated with varying degrees of psychological dependence and social dysfunction which, in the case of certain drugs, may be severe. There are reports of patients who have increased the dosage to many times that recommended. Abrupt cessation following prolonged high dosage administration results in extreme fatigue and mental depression; changes are also noted on the sleep EEG. Manifestations of chronic intoxication with anorectic drugs include severe dermatoses, marked insomnia, irritability, hyperactivity, and personality changes. The most severe manifestation of chronic intoxications is psychosis, often clinically indistinguishable from schizophrenia. **Use in Pregnancy:** Although rat and human reproductive studies have not indicated adverse effects, the use of Tenuate by women who are pregnant or may become pregnant requires that the potential benefits be weighed against the potential risks. **Use in Children:** Tenuate is not recommended for use in children under 12 years of age.

PRECAUTIONS: Caution is to be exercised in prescribing Tenuate for patients with hypertension or with symptomatic cardiovascular disease, including arrhythmias. Tenuate should not be administered to patients with severe hypertension. Insulin requirements in diabetes mellitus may be altered in association with the use of Tenuate and the concomitant dietary regimen. Tenuate may decrease the hypotensive effect of guanethidine. The least amount feasible should be prescribed or dispensed at one time in order to minimize the possibility of overdosage. Reports suggest that Tenuate may increase convulsions in some epileptics. Therefore, epileptics receiving Tenuate should be carefully monitored. Titration of dose or discontinuance of Tenuate may be necessary.

ADVERSE REACTIONS: *Cardiovascular:* Palpitation, tachycardia, elevation of blood pressure, precordial pain, arrhythmia. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride. *Central Nervous System:* Overstimulation, nervousness, restlessness, dizziness, jitteriness, insomnia, anxiety, euphoria, depression, dysphoria, tremor, dyskinesia, mydriasis, drowsiness, malaise, headache, rarely psychotic episodes at recommended doses. In a few epileptics an increase in convulsive episodes has been reported. *Gastrointestinal:* Dryness of the mouth, unpleasant taste, nausea, vomiting, abdominal discomfort, diarrhea, constipation, other gastrointestinal disturbances. *Allergic:* Urticaria, rash, ecchymosis, erythema. *Endocrine:* Impotence, changes in libido, gynecomastia, menstrual upset. *Hematopoietic System:* Bone marrow depression, agranulocytosis, leukopenia. *Miscellaneous:* A variety of miscellaneous adverse reactions has been reported by physicians. These include complaints such as dyspnea, hair loss, muscle pain, dysuria, increased sweating, and polyuria.

DOSAGE AND ADMINISTRATION: Tenuate (diethylpropion hydrochloride): One 25 mg. tablet three times daily, one hour before meals, and in mid-evening if desired to overcome night hunger. Tenuate Dospan (diethylpropion hydrochloride) controlled-release: One 75 mg. tablet daily, swallowed whole, in mid-morning. Tenuate is not recommended for use in children under 12 years of age.

OVERDOSAGE: Manifestations of acute overdosage include restlessness, tremor, hyperreflexia, rapid respiration, confusion, assaultiveness, hallucinations, panic states. Fatigue and depression usually follow the central stimulation. Cardiovascular effects include arrhythmias, hypertension or hypotension and circulatory collapse. Gastrointestinal symptoms include nausea, vomiting, diarrhea, and abdominal cramps. Overdose of pharmacologically similar compounds has resulted in fatal poisoning, usually terminating in convulsions and coma. Management of acute Tenuate intoxication is largely symptomatic and includes lavage and sedation with a barbiturate. Experience with hemodialysis or peritoneal dialysis is inadequate to permit recommendation in this regard. Intravenous phentolamine (Regitine®) has been suggested on pharmacologic grounds for possible acute, severe hypertension, if this complicates Tenuate overdosage.

Merrell

9-4672 (1957A)

**Overweight may not always be simple...
complications can develop.*
Complicated or not...**

Tenuate[®] Dospan[®] ^{IV} **(diethylpropion hydrochloride NF)** **75 mg. controlled-release tablets**

A useful short-term adjunct in an indicated weight loss program.

Overweight patients in certain diagnostic categories often require strict appetite control and a successful program of weight reduction may tend to diminish the incidence or severity of the complications in some patients. Diethylpropion hydrochloride has been reported useful in such patients and while it is not suggested that Tenuate itself in any way reduces the complications of overweight, it may have a useful place as a short-term adjunct in a prescribed dietary regimen. **Tenuate should not be administered to patients with severe hypertension; see additional Warnings and Precautions on the opposite page.**

In uncomplicated overweight.

Many patients, on the other hand, present with excess fat but no disease. While this condition is often termed uncomplicated obesity, complications of both a social and a psychologic nature may be distressingly real for the patients. In these cases, a short-term regimen of Tenuate can help reinforce your dietary counsel during the important early weeks of an indicated weight loss program.

Clinical effectiveness.

The anorectic effectiveness of diethylpropion hydrochloride is well documented. No less than 16 separate double-blind, placebo-controlled studies attest to its usefulness in daily practice.¹ And the unique chemistry of Tenuate provides "...anorectic potency with minimal overt central nervous system or cardiovascular stimulation."² Compared with the amphetamines, diethylpropion has minimal potential for abuse.

**Tenuate—it makes sense.
And it's responsible medicine.**

*Studies have shown that obesity is associated with an increased incidence of hypertension, symptomatic heart disease, adult-onset diabetes, and other diseases.

For prescribing information see opposite page.

Important data on the pain of acute cystitis:

In 87% of patients studied (303 of 349), Azo Gantanol® reduced pain and/or burning within 24 hours*

A controlled, multicenter study assessed the efficacy of Azo Gantanol in relieving pain and/or burning associated with acute urinary tract infection in patients with at least 100,000 colonies per ml of a sulfonamide-sensitive organism, usually *E. coli*. In 87% of patients with initial symptoms rated "moderate to severe," Azo Gantanol therapy resulted in improvement within 24 hours.

Fast pain relief plus effective antibacterial action

Azo Gantanol®

Each tablet contains 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl.

for
the pain

for
the pathogens

Before prescribing, please consult complete product information, a summary of which follows:

Indications: In adults, urinary tract infections complicated by pain (primarily pyelonephritis, pyelitis and cystitis) due to susceptible organisms (usually *E. coli*, *Klebsiella-Aerobacter*, *Staphylococcus aureus*, *Proteus mirabilis*, and, less frequently, *Proteus vulgaris*) in the absence of obstructive uropathy or foreign bodies. **Note:** Fully coordinate *in vitro* sulfonamide sensitivity tests with bacteriologic and clinical response; a aminobenzoic acid to follow-up culture media. Increasing frequency of resistant organisms limit the usefulness of antibacterials including sulfonamides. Measure sulfonamide blood levels at intervals; variations may occur; 20 mg/100 ml should be maximum total level.

Contraindications: Children below age 12; sulfonamide hypersensitivity; pregnancy at term and during nursing period; because Azo Gantanol contains phenazopyridine hydrochloride it is contraindicated in glomerulonephritis, severe hepatitis, uremia, and pyelonephritis of pregnancy with G disturbances.

Warnings: Safety during pregnancy not established. Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been reported and early clinical signs (sore throat, fever, pallor, purpura or jaundice) may indicate serious blood disorders. Frequent CBC and urinalysis with microscopic examination are recommended during sulfonamide therapy.

Precautions: Use cautiously in patients with impaired renal or hepatic function, severe allergy, bronchial asthma; in glucose-6-phosphate dehydrogenase-deficient individuals in whom dose-related hemolysis may occur. Maintain adequate fluid intake to prevent crystalluria and stone formation.

Adverse Reactions: *Blood dyscrasias* (agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia); *allergic reactions* (erythema multiforme, skin eruptions, Stevens-Johnson syndrome, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis); *G.I. reactions* (nausea, emesis, abdominal pain, hepatitis, diarrhea, anorexia, pancreatitis and stomatitis); *CNS reactions* (headache, peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo and insomnia); *miscellaneous reactions* (drug fever, chills, toxic nephrosis with oliguria and anuria, periarteritis nodosa and L. E. phenomenon). Due to certain chemical similarities with some goitrogens, diuretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused rare instances of goiter production, diuresis and hypoglycemia. Cross-sensitivity with these agents may exist.

Dosage: Azo Gantanol is intended for the acute painful phase of urinary tract infections. *Usual adult dosage:* 2 Gm (4 tabs) initially, then 1 Gm (2 tabs) B.I.D. for up to 3 days. If pain persists causes other than infection should be sought. After relief of pain has been obtained, continue treatment with Gantanol (sulfamethoxazole) may be considered.

NOTE: Patients should be told that the orange-dye (phenazopyridine HCl) will color the urine.

Supplied: Tablets, red, film-coated, each containing 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl—bottles of 100 and 500.

A Sketch of the History of Obstetrics and Gynecology in Maryland, 1770-1976

By JOHN E. SAVAGE, MD

This paper was presented in part at the Mid-Year Meeting of the American Association of Obstetricians and Gynecologists on Apr. 29, 1977, at Baltimore, MD. For reprint and other data, write Dr. Savage at RD #4, Box 204, Cambridge, MD 21613.

Obstetrics as an art and science received scant attention from the early colonists. It was not until the middle of the 18th Century that medical men either in Europe or the English Colonies began to accord it a place in the practice of medicine and assumed any considerable responsibility. Up to then, midwives were largely in control of the practice of Obstetrics.

In 1774, a Mrs. C. G. Reiman advertised, "That having qualified as a midwife, she hopes, in so prolific a town as Baltimore, to get patronage." Her hopes may have been well-founded, for the population of the Province of Maryland was said to have been between 200,000-300,000, and in Baltimore 5,900. An added factor was that there were recorded only 10 physicians in the city on that date.

By 1800, gynecology had not even begun to be a separate subject, even though Lotichius, of Frankfurt, in the 17th Century first used the word in his dissertation entitled *Gynaecologia*. Physicians in the provinces maintained their versatility by practicing general medicine and surgery, which in many instances embraced gynecology and obstetrics.

At mid-18th Century, physicians treated symptoms rather than diseases, and the clinical thermometer, hypodermic syringe and stethoscope were not yet available to them.

1770 - 1800

The period from 1770 - 1800 encompassed the American Revolution and its aftermath. In 1776, the Congress assembled in Baltimore. Physicians in Maryland played prominent roles in manufacturing salt-petre, became surgeons in the military, helped provide arms, passed quarantine laws, combatted various epidemics and treated victims of natural disasters such as the hurricane of 1788. Several local medical societies were organized, mainly to help restrict the practice of medicine to those duly-qualified, in order to eliminate quackery. The plan and actions of the Medical Society of Baltimore in 1788 apparently laid the foundations for the charter of the Medical and Chirurgical Faculty of Maryland, which was incorporated in 1799.

George Buchanan studied under William Shippen of Philadelphia and served with him in the Revolution. He lectured to a class of nine students in Baltimore in the winter of 1789-90 on diseases of women and children, and was a founder of the Medical and Chirurgical Faculty of Maryland. In the same year, Andrew Wie-

senthal lectured in his home to 15 students on a variety of topics, one of which was the gravid uterus, and in 1797 lectured on midwifery.

The year 1796 marked the incorporation of the City of Baltimore, and the arrival from abroad of John Beale Davidge. The latter began lectures in his home in 1802 on a number of subjects, including midwifery. When the College of Medicine of Maryland was established by an act of the Legislature in 1807, he was one of the founders and became the first Professor of Obstetrics and the first Dean. The University of Maryland thus came into being and, according to Williams, was the fifth such school to be founded in this country. Of these five schools Williams wrote in 1903, "These schools have pursued an uninterrupted existence, continuing to the present day, and should be regarded as the pioneers in medical education in this country."

1800 - 50

Baltimore Town at the close of the 19th Century and the beginning of the 19th was described as the geographic center of the Republic. With world trade controlled by Great Britain and the United States because of war in Europe, Baltimore shared in the general prosperity. Tobacco, corn, wheat and flour were the important staple exports. Shipbuilders produced the *Baltimore Clippers* which became world famous as the fastest commercial vessels afloat.

John Archer of Harford County was the recipient of the first medical diploma issued in America on June 21, 1768 from the College of Medicine of Philadelphia (united with the University of Pennsylvania in 1791). He made a number of contributions to obstetrical literature, beginning in 1810, in the early numbers of the *Medical Repository*. He also was one of the founders of the Medical and Chirurgical Faculty, and served in the Army during the Revolution.

Although he never performed the operation, James Cocke, a partner in practice of John B. Davidge and a founder with him of the College of Medicine of Maryland, defended the practicability and propriety of ovariectomy in a thesis in 1804. Ephriam McDowell successfully performed ovariectomy by abdominal section in 1809 in Kentucky. He was again successful in 1813 and 1816, and a number of times subsequently. He was given an honorary degree by the University of Maryland School of Medicine in 1825.

Horatio G. Jameson, MD (Univ. of MD, 1813) is said to have been the first in Baltimore in 1824 to attempt ovariectomy, and the first in America to excise the cervix uteri.

In 1835, and again in 1838, William Gibson, Professor of Surgery at the University of Maryland, performed

successfully Caesarean sections on the same patient. This was one of the earliest instances in this country of this having been done.

Thoms states that one of the major contributions of an American to obstetrics was the introduction in 1807 of ergot into clinical obstetrics by John Stearns of Massachusetts. According to Williams, Pierre Chatard, who settled in Baltimore about 1800, was the most distinguished early obstetrician in Maryland. In 1820 and 1821, he published the results of his experiments with ergot. These record some of the earliest clinical trials of ergot in America. Chatard approved of its use when "the parts are dilated and there is mere inertia of the womb." From about 1800 until he died in 1848, he delivered 4,309 patients in his private practice and left fairly full notes of all his cases. These notes were published by his son-in-law, W. C. Van Bibber, MD (Univ. of MD, 1845). The work of these and other pioneers ultimately led to the development of modern oxytocic drugs. Professor M. S. Karasch, at the University of Maryland, College Park, and Professor M. R. Thompson of the University of Maryland School of Pharmacy were two of the four investigators who, in 1935, independently and almost simultaneously isolated the alkaloid of ergot which produced the prolonged action of the uterus most useful in obstetrics. Ergonovine was the name given this compound. It has now been synthesized, but the naturally-occurring alkaloid is the source of almost all of this oxytocic drug now used in this country.

The Baltimore Infirmary was completed and occupied in 1823. It is believed that here for the first time in this country medical students benefitted by intramural residency training. There were four subsequent additions to this building, which became the University of Maryland Hospital.

John Fonerden, MD (Univ. of MD, 1823) was Professor of Obstetrics and Diseases of Women and Children at Washington Medical University of Baltimore. He was the first Librarian, then Secretary, then President of the Medical and Chirurgical Faculty of Maryland. It has been written that he was the personal physician and friend of Johns Hopkins, who appointed him a trustee of both his Hospital and his University.

The first session of the American Medical Association convened in Baltimore in 1848, with 21 delegates from the Medical and Chirurgical Faculty and five from the Medical and Surgical Society of Baltimore present. In that same year, John Murphy is said to have performed the first successful ovariectomy in Baltimore.

1850 - 1900

One of the most fundamental and far-reaching medical contributions in its ultimate effect came with the publication in 1853 by Francis Donaldson, MD (Univ. of MD, 1846) in his paper entitled, *The Practical Application of the Microscope to the Diagnosis of Cancer*. In 1866, he became Professor of Physiology and Hygiene at the University of Maryland. He is said to have been the first person in this country to take biopsies and with the aid of a microscope make the diagnosis of cancer.

Unfortunately, his discovery remained unused for a number of years. With the increasing use of the microscope, much basic work evolved in all fields of medicine, including obstetrics and gynecology. As an example, we point to the establishment of the entity of carcinoma in-situ of the cervix beginning with the publication in 1900 by Thomas S. Cullen of Baltimore of his book entitled, *Cancer of the Uterus*. In this work appeared the first recorded histologic picture of carcinoma in-situ of the cervix; however, it is said that Cullen was unaware of its significance. Others subsequently built further on this concept, which will be elaborated upon later in this account.

Professor Edward Warren of the University of Maryland in 1856 published a prize essay entitled *On the Influence of Pregnancy on the Progress of Phthisis*. More and more papers on subjects in both obstetrics and gynecology began to be published, among which were a report on the introduction of an unfenestrated forceps and a new pessary for the treatment of procidentia uteri.

The first chair of the Disease of Women and Children in the US was established at the University of Maryland in 1867 with the appointment of Professor William T. Howard to that post. He and Henry P. C. Wilson are recognized as the co-founders of the former Hospital for Women of Maryland. Wilson for some years was believed to have been the only pure obstetrician-gynecologist in Baltimore. He was first in Maryland to remove the uterine appendages by abdominal section, and the second to perform ovariectomy successfully. He was a prolific writer on obstetrical and gynecological subjects. Kelly stated that Wilson was practically the founder of gynecology in Maryland. Howard and Wilson were among the founders of the American Gynecological Society.

Randolph Winslow, Professor of Surgery at the University of Maryland, is credited with being the first in Maryland to have shortened the uterine ligaments (1884), and to have performed vaginal hysterectomy (1888). Thomas A. Ashby, Professor of Obstetrics at the University of Maryland, is said to have performed the first successful laparotomy for ruptured tubal pregnancy in 1880.

Interest in pain relief during childbirth became evident with the publication of treatises on the subject. George W. Miltenberger became Professor of Obstetrics at the University of Maryland in 1858, after having been Dean since 1855. He published a paper in that year entitled *Chloroform in Obstetrics*. He was appointed consulting physician to the Johns Hopkins Hospital upon its opening in 1889. W. J. C. Du-Hamel, MD (Univ. of MD, 1849) in 1870 wrote *On Chloral Hydrate as an Anesthetic in Parturition*, which is thought to have been the first employment of this drug for this purpose in America. He also wrote on Chloroform. Thomas S. Latimer, MD (Univ. of MD, 1861), wrote the first paper in Baltimore on anesthesia in midwifery.

Emphasis on the care of women has been limited to the recent 20th Century. The Maternité, or Lying-in Hospital in Baltimore, was founded in 1874, and

Thomas Opie, Professor of Obstetrics and Dean of the College of Physicians and Surgeons of Baltimore, was the attending obstetrician. (He was one of the Founding Fellows of the American Association of Obstetricians and Gynecologist in 1888.) Under the auspices of the same school, the Maryland Woman's Hospital was founded in 1878. The Woman's Medical College of Baltimore, the first medical college exclusively for women in the South, and either the fourth or fifth in the US, was chartered in 1882. In the same year, the Hospital for the Women of Maryland was founded by Henry P. C. Wilson and William T. Howard. A Free Lying-in Hospital was established in 1887, in the vicinity of the University Hospital, and was under the direction of the Professor and the Demonstrator of Obstetrics. The medical students of the University there were afforded clinical experience in obstetrics, which seems to have been the first serious attempt at practical instruction.

In 1879 and 1880, Henry P. C. Wilson successfully accomplished two operations unusual in that era. He removed an ovarian tumor in the fourth month of pregnancy from a patient whose pregnancy had been diagnosed prior to operation, and who was delivered at term of a healthy child. He also achieved a notable result when operating upon a patient who had a twin pregnancy, one extrauterine and the other intrauterine. The extrauterine child was removed alive and the intrauterine child was delivered naturally.

In spite of the growing number of medical schools (at least six) and hospitals devoted to the care of women, the obstetrical situation in Baltimore appears not to have been in a desirable condition in the late 1880s. Most of the so-called lying-in hospitals were small, poorly-managed and equipped, and were without adequate medical supervision or nursing. Hospitalization of obstetrical patients had not become popular. Prenatal care was generally nonexistent. Antiseptic technique was imperfect, and infection was frequent. Eclampsia, accouchement force, craniotomy and pelvic deformities due to rickets were common, and Caesarean section was resorted to infrequently; however, in the early 1890s, the hospital situation began to improve. Better organization and teaching by qualified and experienced physicians seems to have brought about this betterment in practice, together with the successful establishment of the carefully-supervised "Outdoor Clinic" at the University. Leonard E. Neale became Professor of Obstetrics at the University of Maryland in 1896. In the opinion of Rowland, Neale was probably better qualified as a clinical obstetrical teacher and practitioner than any other man then present in Baltimore or any who had preceded him.

In 1889, the new Johns Hopkins Hospital was opened with Howard A. Kelly as Gynecologist-Obstetrician and Professor of Gynecology and Obstetrics; however, no obstetrical patients were admitted until 1896. The first class of students entered the Johns Hopkins University School of Medicine in 1893. The teaching of obstetrics was begun in 1894, and was entirely under the direction of J. Whitridge Williams. George W. Dobbin joined Williams in teaching in 1896, and retained this

position until 1901, when he was elected Professor of Obstetrics at the College of Physicians and Surgeons of Baltimore.

Howard A. Kelly in 1889 accepted the Professorship of Obstetrics and Gynecology in the Johns Hopkins University, and the Directorship of these Departments in the hospital. He held the academic title of Professor of Obstetrics and Gynecology throughout his tenure, but neither practiced nor taught obstetrics. As a world-renowned gynecologist, he pioneered in the development of female urology, which became an integral part of his Department. He developed the technique of air cystoscopy with catheterization of the female ureters under direct vision. He invented instruments and created operative procedures which bear his name. Harvey has said that Kelly "Did more to establish American gynecology as a surgical specialty than anyone before or since his generation." Adding Max Brodel to his staff in 1893 ultimately led to the creation of the Department of Art as applied to medicine, of which Brodel became the first Director. Kelly produced many books and papers on subjects in his field, as well as in the fields of natural history and medical biography. One of his hobbies was herpetology. He was President of the American Gynecological Society in 1912, and was a fellow of almost countless other societies (medical and natural history) both American and foreign. He was a teacher, a scientist, a most skillful surgeon, a philanthropist and was deeply religious.

1900 - 76

In writing of obstetrics and gynecology in Maryland in the 20th Century, it is impossible to include all who have made noteworthy contributions. The writer regrets the necessity for this limitation, which is made in deference to a semblance of brevity. Consequently, the material in this period, for the most part, is presented as "thumb-nail" sketches, many of which are those of past and present department heads at the two medical schools in Baltimore.

William S. Gardner, MD (P. and S., 1885), successively at the College of Physicians and Surgeons of Baltimore, was Demonstrator of Obstetrics and Chief of the Outdoor Obstetrics Department and Associate Professor, then Professor of Gynecology. In 1915, he was appointed Professor of Gynecology at the University of Maryland and Gynecologist-in-Chief at the University Hospital. He held this position until his retirement in 1935, when he became Emeritus Professor. In 1921, he was elected President of the Medical and Chirurgical Faculty. Gardner was a meticulous technician and devised a number of original techniques.

James M. H. Rowland was graduated from the Baltimore Medical College in 1892, fourth in a class of 81. In 1900, he was appointed Chief Physician at the Maryland Lying-in Hospital. Elected Dean of the School of Medicine of the University of Maryland in 1916, in 1920 he became Professor of Obstetrics. Both of these positions he held until his retirement in 1939. He was elected President of the Faculty in 1931, and served as Vice President for one year of the Association of

American Medical Colleges. He was instrumental in creating state laws governing the activities of midwives, which together with important medical advances had an ultimate effect in reducing maternal and infant morbidity and mortality.

Rowland was an early advocate of episiotomy in primigravidas before overdilatation of the perineum occurred, as a means of preventing fetal intracranial trauma, and subsequent maternal perineal relaxation. In spite of vigorous disagreement by some of his prominent colleagues in the obstetrical world, he taught and practiced Caesarean section in the treatment of certain types of placenta previa in preference to some of the traumatic methods then in vogue, such as accouchement force and Braxton-Hicks bipolar version. Time has more than vindicated his position. It is believed that Rowland's most important contribution was in the teaching of clinical obstetrics, where he excelled in lectures, clinics and rounds presented with great respect for facts and common sense.

Emil Novak at 20 years of age graduated magna cum laude in 1904 from the Baltimore Medical College (merged with the University of Maryland). In addition to a large private practice, he taught at both University and Hopkins. In 1941, he published his two best-known books, *Gynecological and Obstetrical Pathology*, and *Textbook of Gynecology*. Both of these works have been perpetuated in regularly-revised editions by the author, followed by Edmund R. Novak, J. Donald Woodruff and Howard and Georgeanna Jones. Novak was the author of over 300 articles and four books. He became the first chairman of *The Ovarian Tumor Registry* in 1942. With Nicholson J. Eastman in 1946, he inaugurated the *Obstetrical and Gynecological Survey*, a bi-monthly journal of abstracts with editorial comment. This publication has continuously retained its popularity to this day. In 1947, he became the first Chairman of the *Chorionepithelioma Registry*, and was elected President of the American Gynecological Society. He was recognized throughout the world to have been the foremost authority in the field of gynecological pathology. He was a fellow of the American Association of Obstetricians and Gynecologists, and a member of many other societies and an honorary fellow of a number of foreign associations.

The Johns Hopkins University School of Medicine awarded J. Mason Hundley, Jr., the MD degree in 1916. After an internship and assistant residency at the former Union Protestant Infirmary, now Union Memorial Hospital, he served overseas with a mobile operating unit and an evacuation hospital from July, 1918–May, 1919. Upon his return to Baltimore, he was assistant resident and resident in gynecology at the University Hospital from 1919 through 1921. His chief was his father, J. Mason Hundley, who was Professor of Gynecology at that time. From associate in gynecology in 1921, he rose progressively until 1935, when he was appointed Professor of Gynecology and Head of the Department at the University of Maryland School of Medicine. Upon his retirement in 1955, he was made Emeritus Professor.

Hundley initiated and developed the Department of Oncology at the University Hospital with Grant E. Ward, and created the Division of Female Urology. His many publications reflected his special interest in female urology, pelvic cancer, radiation therapy of pelvic malignancies and ovarian tumors. He was a fellow of the American Gynecological Society, the American Association of Obstetricians and Gynecologists, the American Urological Association and the Southern Surgical Association. He organized the Maryland Division of the American Cancer Society and was Chairman of its Executive Board for 11 years.

Succeeding J. M. H. Rowland, Louis H. Douglass, MD (Univ. of MD, 1911) became Professor of Obstetrics and Obstetrician-in-Chief at University Hospital in 1938. When Baltimore City Hospitals expanded, he organized the obstetrical department and became the first Obstetrician-in-Chief in 1934. The service was the largest in the city for a number of years. With Douglass and Nicholson J. Eastman as Co-Chairmen in 1935, the Maryland State Maternal Mortality Committee was formalized, it being the sixth in the US in order of organization. In 1951, Douglass was one of the 13 original members, a Director and the first First Vice President of the American Academy of Obstetrics and Gynecology, which became the American College of Obstetricians and Gynecologists. Douglass was one of the founders and the first President of the Baltimore Rh Typing Laboratory, Inc., which was one of the earliest and best-known in its field. From his internship to his retirement in 1955, he served the University for 44 years, except for the period from June, 1917–to October, 1919, when he was with the US Marines as a member of the US Navy Medical Corps Reserve.

Upon the retirement in 1955 of Louis H. Douglass as Professor of Obstetrics, and J. Mason Hundley, Jr., as Professor of Gynecology, Arthur L. Haskins, Jr., was named Professor of Obstetrics and Gynecology in the University of Maryland School of Medicine, and Obstetrician-Gynecologist-in-Chief at University Hospital. This was the first time in the history of medical education in Maryland that those two specialties were combined in one Department. Haskins came to the University from Washington University School of Medicine, in St. Louis, MO. He has contributed extensively to the literature of endocrinology and infertility. Among his many professional memberships, he is a fellow of the American Association of Obstetricians and Gynecologists.

During his time, J. Whitridge Williams, MD (Univ. of MD, 1888) became not only the outstanding obstetrical figure in Baltimore, but also one of the two or three prominent men in the country. In 1899, he became Professor of Obstetrics at Johns Hopkins University School of Medicine, and Obstetrician-in-Chief of the Hospital. In 1919, he held these positions as the head of the first fulltime Department of Obstetrics in this country. When he was elected to fellowship in the American Gynecological Society, he was the youngest member ever admitted, and in 1914 he served as its President.

The first edition of Williams' Textbook, *Obstetrics*, appeared in 1903, and through many subsequent editions, it has remained one of the most popular texts in the field. In addition to his text, he contributed a total of 120 papers to the literature. Starting in 1900, and for the following 30 years, Williams wrote 15 monographs on different phases of placentation, and thus became the authority of his era in that field. In addition to his departmental responsibilities he was Dean of the medical school from 1911-1923, a position, it is said, he held with distinction. In 1916, he was elected President of the Medical and Chirurgical Faculty. Among his papers were those relating to the effect of contracted pelves on dystocia, especially the studies demonstrating the funnel pelvis as a common cause, and a monograph on spondylolisthesis, pathology of the placenta and premature separation, toxemias of pregnancy, hydatidiform mole and chorionepithelioma, prevention of fetal syphilis and pelvic pathology.

Upon the retirement of Howard Kelly in 1919, Thomas S. Cullen was appointed Professor of Clinical Gynecology and Head of the Department of Gynecology. He served in these positions until he retired in 1939. In addition to the book, *Cancer of the Uterus*, his writings included topics in gynecological pathology, pelvic diagnosis, medical history and bibliography. Cullen was elected President of the Faculty in 1927. Senior members of his staff during his tenure, all of whom were parttime, were Guy L. Hunner, Edward H. Richardson, Sr., Emil Novak and Dewitt B. Casler. Cullen established the Gynecological Pathology Laboratory at the Hospital.

In 1939, Richard W. TeLinde was appointed Professor and Head of the Department of Gynecology and Gynecologist-in-Chief of the Johns Hopkins Hospital. In 1956, he became fulltime, and for the first time in the history of Hopkins, every department of the school was on a fulltime status. He is a firm believer in the long-term residency system. His publications number over 100, and his magnum opus is the popular text, *Operative Gynecology*, which continues in updated editions. His chief interests include carcinoma in-situ of the cervix, female urology with special emphasis on urinary incontinence, endometriosis and gynecological pathology in general. His memberships include the American Gynecological Society, of which he was President in 1953; the American Gynecological Club, of which he was President in 1949; Southern Surgical Society; Society of Pelvic Surgeons and honorary fellowship in many foreign societies. TeLinde is widely recognized as a preeminent surgeon and an inspiring teacher and lecturer. Presently, he is Professor of Gynecology Emeritus, and has established a professorial chair in gynecological pathology. This endowment also will be used to help maintain the Gynecological Pathology Laboratory. J. Donald Woodruff is the first Richard W. TeLinde Professor of Gynecologic Pathology.

Building on the previously-mentioned work of Donaldson in 1853, and Cullen in 1900, Baltimore physi-

cians have played an important role in developing the means of early detection of cancer of the cervix, and also in cancer research. Richard W. TeLinde and Gerald A. Galvin at Hopkins established the histologic criteria for the diagnosis of carcinoma in-situ of the cervix. In 1952, Galvin, Howard W. Jones, Jr. and TeLinde published their classic paper, *Clinical Relationship of Carcinoma in-Situ and Invasive Carcinoma*. In addition, screening by cytology and biopsy when indicated have become recognized techniques for early diagnosis. George O. Gey, also at Hopkins, became the first to culture and grow carcinoma of the cervix cells, and thus founded the cell line ("HeLa") which now has been kept alive over 25 years. These cells have contributed immensely to studies in molecular and cell biology; however, recent developments have shown that many of the established cell lines in the American Type Culture Collection are believed to be "HeLa" contaminated. This has been a heavy blow to many investigators, who now realize that their careful laboratory methods must be even more meticulous.

Upon the death of J. Whitridge Williams in 1931, John McF. Bergland, a parttime member of the staff at Hopkins, who also taught at the University of Maryland, was appointed Acting Director of the Department of Obstetrics and Obstetrician-in-Chief of the Hospital. He was one of the leading practicing obstetricians in Baltimore with an extensive practice.

In 1935, Nicholson J. Eastman was elected Professor of Obstetrics and Obstetrician-in-Chief of the Johns Hopkins Hospital. With Richard TeLinde, he continued the tradition of separate Departments of obstetrics and gynecology. His interests were worldwide, as evidenced by his election to the Chairmanship of the Committee on Maternity Care, and the Committee on Midwifery Training of the World Health Organization (WHO.) One of Eastman's primary interests was that of the role of obstetric factors in the causation of cerebral palsy and neuropsychiatric conditions. He was President of the American Academy of Cerebral Palsy in 1957. His series of reports, entitled *Fetal Blood Studies*, established him as one of the pioneers in clinical research in the field of reproductive medicine, and he was considered by many to have been a founder of perinatal medicine. He was President of the American Association of Obstetricians and Gynecologists in 1953, where he gave his Presidential Address, *Mount Everest in Utero*. This now is considered a classic in the study of the environmental relationships of the mother and fetus. He was President of the American College of Obstetricians and Gynecologists in 1962, and President of the American Gynecological Society in 1964. He had a deep interest in forensic obstetrics. He edited three editions of *Williams Obstetrics*, and was a founding editor with Emil Novak in 1946, of *The Obstetrical and Gynecological Survey*.

The Departments of gynecology and obstetrics at Hopkins, like those at Maryland, had been separate from their inception, were combined in 1960 under Allan C. Barnes, who became the first Professor and Director of the Department of Gynecology and Obstetrics, Johns Hopkins University School of Medicine

and Gynecologist-Obstetrician-in-Chief of the Johns Hopkins Hospital. Previously, he had been Professor and Chairman of the Departments of Obstetrics and Gynecology at Ohio State University College of Medicine, and Western Reserve University School of Medicine, respectively. In 1970, he resigned his position at Hopkins to become Vice President for Biomedical Affairs of the Rockefeller Foundation. Barnes is a member of numerous national and international organizations. He has served as Chairman of the Obstetrics and Gynecology Advisory Committee of the Food and Drug Administration (FDA.) He has written on many and diverse subjects in the field. His paper, *Body Production of ACTH in Response to Gynecologic Surgery and Irradiation*, received the 1952 Foundation Award for gynecologic research of the American Association of Obstetricians and Gynecologists. He was a member of the Advisory Panel on Maternal and Child Health of the World Health Organization. He is Editor Emeritus of the *American Journal of Obstetrics and Gynecology*.

In the period from June, 1970 until November, 1971, Howard W. Jones, Jr., was Acting Chairman of the Department of Gynecology and Obstetrics at Hopkins. He, with Georgeanna Seegar Jones, both of whom are Professors of Gynecology and Obstetrics, are Co-Editors-in-Chief for Gynecology of *The Obstetrical and Gynecological Survey*. They are eminent authorities in the field of reproductive endocrinology, and are greatly in demand as speakers, both in this country and abroad.

Theodore M. King became Professor and Director, Department of Gynecology and Obstetrics of the Johns Hopkins University School of Medicine and Gynecologist-Obstetrician-in-Chief of the hospital in November, 1971. He was called to this post from the Albany Medical College, where he had been Chairman of the Department of Obstetrics and Gynecology from 1968. He has conducted extensive research in the fields of reproductive pharmacology and fertility control. Among his fellowships are those in the American Gynecological Society and the American Association of Obstetricians and Gynecologists. Currently, he is Chairman of the Advisory Committee on Obstetrics and Gynecology of the Food and Drug Administration, and a member of the Advisory Committee in Obstetrics and Gynecology for the US Pharmacopeia.

Epilogue

C. V. Wedgewood has written: "History is lived forwards, but it is written in retrospect. We know the end before we consider the beginning, and we can never wholly recapture what it was to know the beginning."

Acknowledgments

The author expresses his sincere thanks to Miss Hilda E. Moore, Librarian Emeritus, and her staff at the Health Sciences Library of the University of Maryland for their kind assistance in providing reference materials. Appreciation also is expressed to Howard W. Jones, Jr., and Theodore M. King for their invaluable aid.

OUR ONLY BUSINESS

"EVERYTHING FOR THE WOODBURNING PUBLIC"

OUR PROFESSIONAL SALES STAFF

RALPH BAUMGARDNER, MARY MCGREGOR, PAUL WILLIAMS

When you consider energy costs today, it's easy to understand why thousands of Maryland homeowners have turned to Fisher® Woodstoves. Fisher Stoves can save up to 75% on your heating bills and will burn 18 to 24 hours on one fueling of coal or wood. Fisher Stoves are firebrick lined, guaranteed for five years, virtually airtight and have patented Spin Draft Air Controls. These features make Fisher the highest quality, American-made woodstove.

At BAUMGARDNERS', you can choose from sixteen models and ten eye pleasing colors of Fisher® Woodstoves in both Stove and Fireplace models. The new Fireplace Insert model can make your existing fireplace ten times more efficient. We can answer any questions you may have regarding heating with wood. Keep in mind that we also sell fitted Glass Fireplace Doors, Chimney systems, fireplace toolsets and more... everything you need for your fireplace or woodstove to warm and beautify your home.

Fisher® Stoves - An idea America is warming up to.

TWO SYMBOLS OF THE "WORLD PORT OF BALTIMORE": (nautical) The USS **Constellation** and (medical) Dr. John B. MacGibbon (inset.)

Baltimore's "Port Doctor:" An Exclusive JOURNAL Interview With John Butler MacGibbon, MD

By BLAINE TAYLOR

Contact Mr. Taylor, *Journal* Managing Editor, for reprint and other data c/o the *Journal*, 1211 Cathedral St., Balto., MD 21201.

Introduction: A Unique Practice

This physician is a man with a unique medical practice: foreign merchant seamen. As Baltimore's "port doctor" for the last two decades, John Butler MacGibbon, MD, 57, has treated literally thousands upon thousands of sailors from all over the world from ocean-going vessels which daily arrive at—and leave—the "world port of Baltimore," formerly home of the famed Baltimore Clipper ships and currently host to the USS *Constellation*, the submarine *Torsk*, the Maryland Sea Service Cadets and the new World Trade Center Baltimore.

Dr. MacGibbon—a soft-spoken, pleasant, ruddy-faced man with graying hair and a friendly smile—is, like his patients, a foreigner. Although a resident of the United States since he first arrived in 1950, the internal and occupational medicine practitioner still retains the citizenship of his native New Zealand, where he was born at Christchurch on Nov. 24, 1921.

The single physician—who resides in Baltimore's suburban Northwood section—has had his practice headquartered for the last seven years in an office at 800 Cathedral St. downtown, four blocks south of the Faculty Building of Med-Chi (of which he has been a member since 1955.) Before that, his office was located since 1959 near the US Customs House at Gay and Lombard Sts., adjacent to the harbor. (It was in the Cathedral St. office that he was interviewed by the *Journal* on June 7, 1979.)

The man whose hobbies include music, swimming and reading (biographies, plus a smattering of fiction) has current appointments as Physician to the Outpatient Department (Moore Clinic) and as an Instructor in Medicine at the Johns Hopkins University School of Medicine, and it was to Hopkins that he turns for relief physicians to hold down his unusual practice when he goes on vacation—usually for three weeks and often to New Zealand, where he performed a Rotating Internship at Christchurch City Hospital during 1948-50, before serving a year's Residency at Baltimore's Church Home and Hospital.

Between 1951-54, Dr. MacGibbon served a fulltime fellowship in medicine at Hopkins, returning for a year's Chief Residency at Church Home in 1954. The following year saw him at the University of Maryland, and he served during 1956-58 as Assistant to the Chief of Medicine of the US Naval Hospital at Portsmouth, NH. From 1957-62, Dr. MacGibbon was a Lieutenant Commander in the US Naval Reserve.

He began his private practice in 1959, and is on the staffs of Church Home, Union Memorial and South

Baltimore General Hospitals. A member of the AMA, the Baltimore City Medical Society; the British, New Zealand and Southern Medical Associations; the Hopkins Medical and Surgical Association and the Maryland Society for Rheumatic Diseases, Dr. MacGibbon's publications include *Treatment of Tuberculosis Meningitis* (*New Zealand Medical Journal*), 1950; *Anaphylactic Reaction to Penicillin* (*British Medical Journal*) and *Neurological Complications of Serum Administration* (*American Journal of Medical Sciences*.)

The year 1959 also witnessed his appointment as Physician to the Norwegian Consulate-Public Health Service Directorate for Seamen, and, since 1965, he has been Public Health Physician to the Italian Cassa Maritima (Marine Fund) and holds similar posts as Contract Physician to the US Quarantine Service and the Swedish Merchant Marine as well. It was Dr. MacGibbon's unusual practice that led the *Journal* to seek him out to discuss his life's work caring for the men who ply the world's oceans.

US Advent

Why did you decide to come to the US?

I had a Fulbright scholarship and an uncle who was a great friend of some of the people in the Hopkins medical unit—specifically Dr. Amos Koontz—which was located at Auckland during World War II.

How did you—from among all the literally thousands of physicians in Baltimore—get selected to do this work with seamen?

I worked for an industrial clinic in town part-time when I was a Resident. When I started out in practice, the clinic handled a lot of this sort of work besides its Workmen's Compensation work. I became friendly with the Norwegian Life Consul at the time, who was a patient of mine, and he asked me if I'd like to take care of their work. I said yes because their doctor had retired and they weren't too happy about having their people go to a large clinic where there wasn't much personal interest in each person as far as following things up was concerned, because they had different doctors all the time.

I took up the practice and it just grew over the years. I've always been interested in ships and the water. As a medical student, I used to spend my vacations working as a longshoreman. As a boy in New Zealand, there was no place there that was more than about 90 miles away from the water. Some years ago, at Annapolis, I used to have a sailboat, too, but I don't now.

"The Port Doctor"

Is it accurate to characterize you as "the port doctor?"

Yes, because I don't know anybody else who does

this work, except for people like Central Medical and Eastern Industrial, which are groups of doctors that examine American crews before sending them out. They also do a lot of work with Workmen's Compensation.

His Work

Please give our readers an overview of the work you do for the various sailors' agencies. I imagine that it all ties-in, right?

Yes. Really, there's no contact with the governments, as it's not a governmental thing. The appointment was originally through the Norwegian Public Health Service, which approves of doctors at various ports throughout the world. The work's done through the local ship's agents and through the insurance companies which insure these people for their health and against accidents. The work occasionally involves going onto the ships to see people who're sick, but, mostly, I see the seamen here in my office.

Aside from my major appointments, the Greeks, Pakistanis, Chinese and Indians are mostly insured by the Protective and Indemnity clubs, which are insurance groups that insure against health and accidents for the sailors and against accidents to the ships, too. Most of them are located in London, and most of their people come here to me, also.

When a ship comes in, it rarely calls ahead. After the ship docks and is cleared by Immigration and Customs, they'll call one of the port service people to pick up the seamen and bring them here at a certain time, ideally, but, in practice, this never happens—they're always an hour or two late. They "had to go to the bank" or "shopping" or whatever, so you never know exactly when anybody is coming. Also, I never know if it's going to be one or 15! They arrive with company forms that have to be filled out, too.

Many times, ships are in from Japan and Australia after a month's voyage, and in port for only about eight hours. The sailors will sometimes use "going to the doctor" as an excuse for going ashore for some shopping, and I suppose you can't blame them, really.

How many seamen patients do you treat in an average year?

About 12 a day.

What do they come in for—general physicals and check-ups?

Sometimes for those and illnesses; often for venereal disease inoculations and vaccinations. I have a small private practice, too, and I see my private patients between 8:30-10 AM, or late in the afternoon.

Are there any conditions or illnesses peculiar to seamen such as, in olden times, scurvy or rickets?

The most common thing, as far as an illness is concerned, is VD. Eye injuries are very common. Occasionally, I'll see people with malaria and typhoid and a lot with intestinal parasitic disease—if they stay long enough to diagnose. Seamen today seem to range in age from 16-70, and are generally healthy as patients go. Also, sanitary conditions on ships today are much better than they were 20 years ago, when they were **terrible**, especially on some developing nations' ships. Tuberculosis is

sometimes a problem with the ships of the developing nation, still, though.

Aboard Ship

If someone is killed on a ship while it's in port, are you the one called in?

No. The State Medical Examiner takes care of that but, most times—with a severe injury or a death—they'll call the city ambulance and the police. They **won't** call me.

How often do you have to board a vessel to treat a sick patient?

Fairly often, but mostly, I go down to give vaccinations. They're usually very well-organized with this and have been doing it for years. They have a list of the crew members and what shots they need. They have the books out and ready, and the whole thing can be done very easily. If it's **not** well-organized, it takes a long time, because you have to look through each person's book to identify the book with the person. This is difficult if they don't speak English. Proper examination of the sick and their treatment on board poses problems. Certain shots—like yellow fever—can't be given on the ships, because the vaccine must be frozen all the time and expires rapidly when thawed. For these, I have to use my office, which is also ideally-located in that it's central to all manner of specialists in this neighborhood: orthopedists, pharmacists, ophthalmologists, dentists, radiologists, eye-glass people, etc. The big problem for the sailors is transportation. If you have to transport them to the Greater Baltimore Medical Center in Towson or to Hopkins to see somebody, you get tied up in red tape in the hospitals. It's not only time-consuming, but you need an interpreter and a guide to take them around, too. Here, they can walk.

As for hospitalization, the Immigration authorities prefer for the sailors to go to the US Public Health Service Hospital in Wyman Park in Baltimore, so they know where they are most of the time. All the sailors are eligible for care there, and the insurance companies like for them to be there, too, because it's on a per diem basis and the costs are reasonably predictable.

Fee Payment

How are YOU paid—by check or currency?

I submit my bill to the owners of the vessels through the local agents, who send it to the insurance companies and back through the chain to me.

How long does the process take for one patient?

Sometimes up to a year and sometimes never, if the company disappears or goes bankrupt. I'm now collecting money, for example, on work I did a year ago. The Venezuelans pay right away, because they send money with the ships to disburse here.

The Ships' Complements

What's the average size of a crew of a tanker or freighter that comes into Baltimore?

It varies a great deal, but an average would be about 30-35. The smaller the ship, the smaller the crew, although this rule doesn't necessarily hold true with the larger ships, which are often fully-automated, with the

crew-size down in the twenties sometimes. On the other hand, on an Indian, Pakistani or other Third World ship, you may find as many as 60 persons!

Do all these ships have their own doctors aboard?

None of them do, unless they have more than 12 passengers or more than 100 in the crew. They can get medical advice in an emergency by radio if need be.

Have you had occasion to treat Soviet sailors?

They have a nurse practitioner or doctor on board who takes care of most things—such as VD—and they won't come to me unless it's quite serious. They usually arrive in the office with one or two others; never do they drift in here alone as some other sailors will do.

The Language Barrier

When you board the ships, do they have translators to help you?

Yes. As a rule, somebody speaks English. It's very hard to get interpreters for Finnish and Turkish, and some other languages, though. In these cases, we have three-way conversations on the phone quite often, with myself, the patient and another doctor who speaks the particular language all participating. The language problem produces many funny remarks. For instance, I've picked up some Greek terms here that I wouldn't use in the general course of conversation **in Greece!** The same goes for my Italian, a lot of which is slang that I've picked up from listening to translators. They're not very **scientific** expressions, I can tell you!

Examples of problems with languages results in some humorous incidents, such as the seaman who disrobed in the dentist's chair and indicated he wanted a circumcision, and the Italian engineer who said "Ia hava the trouble with the lova machinery—she cry;" the Indians who were told the toilet was "All the way out to the back," and later a pedestrian came in from the street and said that there were some men urinating in the back garden!

Difficulties with medications include eating suppositories and inserting them with the paper on. There're also difficulties with the administration of medicine and the need to be very sure of their understanding of the dose and frequency. This is helped by some pharmacists who deal with the ship who're multilingual. Recently, a passenger who spoke no English was put on a plane with a urethral catheter to which was attached a bag to collect the urine. The stewardess took the bag and tried to put it in the baggage locker with predictable results, pulling the patient with it.

Boarding the ship can be somewhat hair-raising at times, especially in the winter from a bobbing launch at sea. Jumping onto an ice-covered gangway or a rope Jacob's ladder can be tricky, also. Some gangways are very steep, so occasionally, it's necessary to use a crane and bucket, or to board a vessel in the stream from a helicopter.

A Physician's Desire

It sounds as if you enjoy your work.

Oh, I do! It's a lot of fun if you like to learn about

different people's customs, geography and history, such as the famous Ashanti nation of Africa, the life and habits of Somalis, Chinese ideas of medical treatment, etc.

If you could do or have one thing to improve your practice, what would it be?

Predictability of when the patients will arrive!

Thank you, Dr. MacGibbon.

An American Company

Accredited Cancer Programs in Maryland

By JOSEPH M. MILLER, MD

Dr. Miller is Chairman for Maryland of the Field Liaison Program, Commission on Cancer, American College of Surgeons, and is also Director of Medical Education at Provident Hospital, Inc., Balto., MD 21215, where he can be contacted for reprint and other data.

Cancer is the second greatest cause of death in the United States. About 650,000 new cases occur in the US every year, and approximately half of this number die of cancer.

Treatment of cancer is much varied in efficacy. Results of initial treatment and frequency of persistency of lesions are generally unpredictable. In the thrust to improve results from specified treatment: 1) Patients with cancer should have the advantages of a multidisciplinary approach during all stages of therapy, 2) cancer conferences should be held in each hospital for continuing education of all physicians, 3) the hospital should have a functioning cancer registry which is an autonomous unit of the hospital, directly accountable to the hospital administration and professionally supervised by the cancer committee.

The total care of the cancer patient entails more than the initial treatment. Rehabilitative measures, persistence of the lesion with overt reappearance in later years and occurrence of primary cancer in other sites, perhaps related to the primary treatment, make registration of these patients in an organized system for long-term surveillance mandatory.

Such a system will lead to improved patient care and contribute to a valid record of end-results for evaluation of treatment. A properly-organized cancer registry in continuous operation will fulfill these requirements.

Maryland now has 11 hospitals among its 50 which have approved cancer programs. Every hospital in the state which has facilities for cancer therapy should have such a program. The qualifications are:

1. The hospital must be accredited by the Joint Commission on the Accreditation of Hospitals.
2. A multidisciplinary Cancer Committee must function in the hospital and must be responsible for:
 - a. A Cancer Registry
 - b. Educational cancer conferences
 - c. Consultation services
 - d. A system of quality-care evaluation with documentation of its operation.

The responsibilities of the cancer committee cover the entire spectrum of cancer care. Membership, therefore, must include representation from surgery, internal medicine, chemotherapy, radiology and pathology.

Follow-up care is most important. To maintain an accredited status, the hospital must insure that at least 90% of its patients are cared for in this way.

The entire effort looks to quality care and quality survival. Patient evaluation in an environment of a multidisciplinary approach is continuously stressed.

The vital link which holds the cancer program in any hospital together is the Liaison Fellow or Associate. Truly a labor of love without financial recompense, this person

1. Will make monthly or perhaps more frequent visits to the cancer registry to discuss problems and seek improvement.
2. Will supervise the clinical tumor program to make the monthly cancer conferences rewarding. Educational films should be shown to the house and hospital staffs.
3. Will meet with the Program Surveyor at the time of review.

Only a small minority of the hospitals in Maryland which treat cancer have an approved program. Of 16,003 beds in the state which might be used to treat cancer, only 4,925 (31%) are in hospitals with an approved program. The good which might arise from a 100% participation can only be envisaged. The fact that a patient has been registered in a hospital program means that a lifetime of follow-up is assured. If the primary physician changes location, retires or dies, continuity of care is forthcoming. A secondary function of the registry is the distribution of accumulated data which reveals the results of efforts by the hospital as a whole which may be compared to regional or national statistics.

Every hospital seeing cancer patients can afford to have a cancer registry. Perhaps the statement should be rewritten that every hospital seeing such patients can not afford not to have a registry.

Hospitals in Maryland which are now accredited include:

1. Franklin Square Hospital, Baltimore
2. Greater Baltimore Medical Center
3. Johns Hopkins Hospital, Baltimore
4. Sinai Hospital of Baltimore
5. Saint Joseph Hospital, Baltimore
6. US Public Health Service Hospital, Baltimore
7. University of Maryland Hospital, Baltimore
8. National Naval Medical Center, Bethesda
9. Saint Mary's Hospital, Leonardtown
10. Peninsula General Hospital, Salisbury
11. South Baltimore General Hospital.

Surgical Treatment of Recurrent Pelvic Cancer After Irradiation

By UMBERTO VILLASANTA, MD, FACOG

Dr. Villasanta's paper is from the Department of Obstetrics and Gynecology at the University of Maryland School of Medicine in Baltimore, where he can be contacted for reprint and other data.

Introduction

Treatment of invasive carcinoma of the cervix (IC stage I-IV) by irradiation produces between 40 and 50% five-year survival. This means that over one-half of the patients treated will have persistent or recurrent disease within five years. Because cervical cancer prefers to spread by direct extension along tissue spaces or lymphatic channels, it remains confined within the cervix and immediately adjacent tissue for a relatively long time before producing distant metastases.¹⁻²

Early diagnosis and management of recurrent malignancy is a difficult problem. Retreatment of radiation failures by irradiation has been attempted. The results have been poor and the incidence of serious complications very high.³⁻⁴ The latter are becoming worse since the introduction of high energy sources, because of the large dose of irradiation delivered to the pelvic tissues surrounding the tumor, which approximates the limit of tolerance. Any further irradiation will result in necrosis and sluff with often lethal consequences.

Better results have been obtained with the use of surgery after radiation failure.⁵⁻⁸ The purpose of this presentation is to add documentation to this method of treatment.

Material and Methods

Several hundred patients who had primary treatment of their pelvic malignancy at this institution or elsewhere were found to have recurrence through the past 15 years. It is impossible to calculate how many patients were selected to be candidates for surgical treatment, because an underterminate number of them refused for different reasons to consent to the operative procedure. This report is based on 100 consecutive patients who accepted surgical treatment for cure of pelvic malignancy after failure of irradiation.

In most patients, tissue diagnosis of recurrence was obtained before surgery, in a few only X-ray evidence or clinical impression was considered valid indication for treatment.⁹ All patients had a previous carcinoma of the cervix with the exception of three who had carcinoma of the ovary (1) or endometrium. (2) Because several patients had their primary treatment at other hospitals and the clinical stage of the disease was unknown, no attempt has been made to analyze the extension of disease at the time of initial diagnosis.

Preoperative evaluation included: complete physical examination, cystoscopy, proctoscopy, long bones survey, chest X-ray, IVP, small bowel series, Barium enema, lymphangiography, liver scan, retrograde pyelogram, pelvic arteriography; however, not all these tests were performed in all patients and the presence of a non-functioning kidney or hydronephrosis was not considered a contraindication for surgery.

Of the 100 patients explored, 42 received less than curative surgery because of extension of recurrent tumor: the procedure ranged between exploratory laparotomy, biopsy and frozen section, to various type of intestinal or urinary tract bypasses. All these patients died of their malignancy and will not be evaluated further.

In the remaining 58 cases, the type and extension of operation was decided after exploration and tailored to the extension of the recurrent disease.⁵ The average age at the time of first treatment (by irradiation) of these 58 patients was 42.6 years, while at the time of surgery for recurrence it was 46.8 years. The mean interval was therefore 51 months. In 15 patients (26%), the recurrence was diagnosed five years or longer after primary treatment and in eight patients more than 10 years after irradi-

ation. The following procedures were done: 11 simple hysterectomies, 11 radical hysterectomies, 31 exenterations (22 total, eight anterior and one posterior), a inguinal lymph node dissection, three segmental resection of the sigmoid colon and a pulmonary lobectomy.

Results

Of 58 patients operated upon with the intent of encompassing the tumor and the aim of cure, 24 (41.4%) are alive and well over five years later (Table 1). The operative mortality was

TABLE 1: Results of Surgical Treatment After Irradiation Failure

	Total	Operative Mortality		Survival	
		#	%	#	%
Abdominal Hysterectomy	11	—		9	82%
Radical Hysterectomy	11	2	18%	4(5)*	36%(45%)
Exenteration	31	11	35.5%	8(9)**	26%(29)%
Miscellaneous	5	—		3	60%
Total	58	13	22.4%	24(26)	41.4% (44.8%)

* Corrected for one death due to coronary thrombosis 18 months after surgery

** Corrected for one death due to malignant lymphoma 56 months after surgery

22.4%; it was much higher after exenterative procedure (Table 2) and nil after simple hysterectomy or miscellaneous surgery. Two patients died, of sepsis and uremia, among the 11 subjected to radical hysterectomy and pelvic lymph node dissection. This appears high, but the total number of patients considered is small. Among the patients with miscellaneous procedures, three (two after segmental resection of the sigmoid colon and one after pulmonary lobectomy), are alive and free of disease over five years later.

Sepsis was the cause of death in seven patients, uremia in two, pulmonary embolism in two, and in the remainder multiple factors were involved. Thirteen patients (22%) required additional surgery to correct various complications such as: small bowel obstruction, vesico-vaginal, rectovaginal or uretero-vaginal fistulas, hydronephrosis, prolapse of colostomy, etc. Eight of these patients died subsequently of carcinoma, while five are alive and free of disease.

One patient died of coronary thrombosis, 18 months after radical hysterectomy and was found free of tumor at autopsy. Another patient died of a malignant mesenteric lymphoma 56 months after anterior exenteration.

Nineteen patients (32.7%) died of cancer on the average 23.7 months after surgery with extremes of two and 104 months. They all had pelvic recurrence and quite a few distant metastases.

The pelvic lymph nodes were available for examination in 42 patients (Table 3). Of the eight patients with positive lymph nodes, four died of cancer and two of complications. One with obturator metastases is alive and free of disease over five years after radical hysterectomy and another, subjected to the same operation after a "false negative" frozen section of a periaortic node that was proven metastatic after permanent section, is also alive 72 months later. Of 34 patients with negative lymph nodes, 11 (32%) died of cancer, 13 (38%) of complications and 10 (30%) are alive.

TABLE 2: Results of Exenterative Operations

	Total	Alive	Died of Complications	Died of Intercurrent Disease	Died of Cancer
Total Exenteration	22	6	9	—	7
Ant. Exenteration	8	2	1	1	4
Post. Exenteration	1	—	1	—	—
Total	31	8(25.8%)	11(35.5%)	1(3.2%)	11(35.5%)

TABLE 3: Status of Lymph Nodes and Survival

Lymph Nodes	Total	Survivors	Dead of Complications	Dead of Cancer
Positive	8	2	2	4
Negative	34*	10	11	11

* 2 patients with negative nodes died of intercurrent disease

Contrary to the findings of Halpin et al, 10 patients who had recurrence shortly after irradiation had poor survival, while those who recurred later had the best survival (Table 4). This certainly reflects the high virulence of the malignant tumor and the poor host resistance as previously observed (11.)

TABLE 4:

Interval Between Primary Treatment and Recurrence	Interval	Number	Survival
< 12 months		21	3
13-24 months		11	5
25-36 months		3	1
37-48 months		4	3
48-60 months		4	2
> 61 months		15	10
Total		58	24

Comment

The great majority of cervical carcinoma in the United States are treated by irradiation. About one-half of these patients will have recurrent or persistent disease (as defined by finding of the cancer in the primary site within six months). Reirradiation of these recurrent tumors is not satisfactory because of the low percentage of "cures" and the high incidence of serious and debilitating complications.

Th surgical approach for irradiation failures offers much better results. The operability rate of patients included in this study (58%) reveals a very good preoperative selection. It is possible that inclusion of more patients could have increased the "cure" rate, in as much as all patients not operated upon died of cancer.

All patients should be prepared for the most radical operation, and the extent of the procedure should be tailored to the extent of the disease and the need of the patient. One should attempt to remove the tumor "en block" with a good margin of normal tissue around it.

The surgical mortality of 22.4% is acceptable, considering that without operation the mortality would be 100%. The over-all five years survival of 41.4% for this group of patients appears excellent. Even a single metastasis in large bowel or lung should be considered for surgical removal because on occasion it will result in a long survival.

The complications rate is proportional to the extension of the surgical dissection. Most of the surgical deaths were due to sepsy. All patients who died of cancer had pelvic recurrence and, in some cases, distant metastases. The incidence of secondary opera-

tion for post-surgical complications appears also acceptable.

The presence of metastatic cancer in the pelvic lymph nodes aggravates the prognosis, but does not preclude survival. On the other side, the finding of negative lymph nodes is no guarantee of cure.

There seems to be a direct relationship between the virulence of the tumor, the rapidity of recurrence and the mortality after re-treatment.

Even the most radical operation succeeded in a satisfactory cure rate (25.8%), in spite of the high postoperative mortality (35.5%) observed in this group of patients.

Most patients with recurrent pelvic carcinoma are regarded as hopeless cases. It would be about time that physicians would start to recognize that something can be gained by an aggressive surgical treatment. Even if the postoperative mortality and the serious complications are high, a 45% survival is certainly better than the inevitable suffering and death due to untreated recurrent malignancy.

Summary

One hundred patients with recurrent pelvic malignancy following irradiation therapy were considered for surgical treatment. Of these, 42 were found to have nonresectable tumors and noncurative treatment was carried out. In the remaining 58, an operation was performed with the intent to eradicate the malignancy. All patients had originally an invasive carcinoma of the cervix, with the exception of three who had carcinoma of the ovary and endometrium. All patients had preoperative evaluation consisting of chest X-ray, long bone series, IVP, Ba enema, lymphangiography, liver scan, etc. The extent of the surgical procedure was determined by the finding at the time of laparotomy. It ranged from simple hysterectomy, to radical hysterectomy, exenteration (22 total, eight anterior, one posterior) and other procedures; 32.7% of the patients operated with the intent of cure died of malignancy, on the average 24 months after surgery; 22.4% of patients died of complications arising from surgery. One patient died of coronary thrombosis and another of lymphoma 18 and 56 months respectively after surgery. The remaining 41.4% are alive and free of tumor over five years after surgical treatment. While reirradiation of patients with post-radiation recurrent malignancy has shown to result in poor survival and excessive serious complications, surgical treatment will succeed in curing a considerable percentage of patients.

Merrell

Bentyl®

(dicyclomine hydrochloride USP)

Capsules, Tablets, Syrup, Injection

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATIONS

Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the following indications as "probably" effective:

For the treatment of functional bowel/irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

THESE FUNCTIONAL DISORDERS ARE OFTEN RELIEVED BY VARYING COMBINATIONS OF SEDATIVE, REASSURANCE, PHYSICIAN INTEREST, AMELIORATION OF ENVIRONMENTAL FACTORS.

For use in the treatment of infant colic (syrup).

Final classification of the less-than-effective indications requires further investigation.

CONTRAINDICATIONS. Obstructive uropathy (for example, bladder neck obstruction due to prostatic hypertrophy); obstructive disease of the gastrointestinal tract (as in achalasia, pyloro-duodenal stenosis); paralytic ileus, intestinal atony of the elderly or debilitated patient; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; myasthenia gravis. **WARNINGS.** In the presence of a high environmental temperature, heat prostration can occur with drug use (fever and heat stroke due to decreased sweating). Diarrhea may be an early symptom of incomplete intestinal obstruction, especially in patients with ileostomy or colostomy. In this instance treatment with this drug would be inappropriate and possibly harmful. Bentyl may produce drowsiness or blurred vision. In this event, the patient should be warned not to engage in activities requiring mental alertness such as operating a motor vehicle or other machinery or perform hazardous work while taking this drug. **PRECAUTIONS.** Although studies have failed to demonstrate adverse effects of dicyclomine hydrochloride in glaucoma or in patients with prostatic hypertrophy, it should be prescribed with caution in patients known to have or suspected of having glaucoma or prostatic hypertrophy. Use with caution in patients with: Autonomic neuropathy. Hepatic or renal disease. Ulcerative colitis. Large doses may suppress intestinal motility to the point of producing a paralytic ileus and the use of this drug may precipitate or aggravate the serious complication of toxic megacolon. Hyperthyroidism, coronary heart disease, congestive heart failure, cardiac arrhythmias, and hypertension. Hiatal hernia associated with reflux esophagitis since anticholinergic drugs may aggravate this condition.

Do not rely on the use of the drug in the presence of complication of biliary tract disease. Investigate any tachycardia before giving anticholinergic (atropine-like) drugs since they may increase the heart rate. With overdosage, a curare-like action may occur. **ADVERSE REACTIONS:** Anticholinergics/antispasmodics produce certain effects which may be physiologic or toxic depending upon the individual patient's response. The physician must delineate these. Adverse reactions may include xerostomia; urinary hesitancy and retention; blurred vision and tachycardia; palpitations; mydriasis; cycloplegia; increased ocular tension; loss of taste; headache; nervousness; drowsiness; weakness; dizziness; insomnia; nausea; vomiting; impotence; suppression of lactation; constipation; bloated feeling; severe allergic reaction or drug idiosyncrasies including anaphylaxis; urticaria and other dermal manifestations; some degree of mental confusion and/or excitement, especially in elderly persons; and decreased sweating. With the injectable form there may be a temporary sensation of lightheadedness and occasionally local irritation. **DOSAGE AND ADMINISTRATION:** Dosage must be adjusted to individual patient's needs.

Usual Dosage: Bentyl 10 mg. capsule and syrup: **Adults:** 1 or 2 capsules or teaspoonfuls syrup three or four times daily. **Children:** 1 capsule or teaspoonful syrup three or four times daily. **Infants:** ½ teaspoonful syrup three or four times daily. (May be diluted with equal volume of water.) Bentyl 20 mg.: **Adults:** 1 tablet three or four times daily. Bentyl Injection: **Adults:** 2 ml. (20 mg.) every four to six hours intramuscularly only. **NOT FOR INTRAVENOUS USE.** **MANAGEMENT OF OVERDOSE:** The signs and symptoms of overdose are headache, nausea, vomiting, blurred vision, dilated pupils, hot, dry skin, dizziness, dryness of the mouth, difficulty in swallowing, CNS stimulation. Treatment should consist of gastric lavage, emetics, and activated charcoal. Barbiturates may be used either orally or intramuscularly for sedation but they should not be used if Bentyl with Phenobarbital has been ingested. If indicated, parenteral cholinergic agents such as Urecholine® (bethanechol chloride USP) should be used.

Product Information as of October, 1978.

Injectable dosage forms manufactured by CONNAUGHT LABORATORIES, INC., Swiftwater, Pennsylvania 18370 or TAYLOR PHARMACAL COMPANY, Decatur, Illinois 62525 for MERRELL-NATIONAL LABORATORIES, Division of Richardson-Merrell Inc., Cincinnati, Ohio 45215, U.S.A.

Doctors in the News

Dr. Conn Honored

The Board of Trustees of the Society for Clinical and Experimental Hypnosis has designated Dr. Jacob H. Conn to be the first Perpetual Fellow of the Society.

Dr. Conn is an Assistant Professor Emeritus of the Johns Hopkins University Medical School and is on the active staff of the Johns Hopkins Hospital. He was the recipient of the first Milton H. Erickson Award of the American Society for Clinical Hypnosis for Scientific Excellence for Writing in Hypnosis in 1971.

Dr. Conn is the recipient of every award in medical hypnosis presented by the Society for Clinical and Experimental Hypnosis. He received the Awards for the best paper in Scientific and Clinical Hypnosis in 1960 and 1968, the 1961 Raginsky Award for Leadership and Achievement as a "Distinguished Psychiatrist, Teacher, Scientist and Pioneer in Hypnotherapy" and the 1964 Schneck Award "to the Physician who made Significant Contributions to Scientific Hypnosis." Dr. Conn also is the recipient of the 1965 S. C. E. H. Presidential Award for his "outstanding work in the field of hypnosis over a period of 25 years" and the first Gold Medal Award in 1970 for "Scientific Achievement for his Outstanding Professional Contri-

butions in the Field of Scientific Hypnosis."

Dr. Conn is an Associate Editor of The International Jr. S. C. E. H., a Scientific Consultant to the Mor-ton Prince Center for Hypnotherapy and an Honorary Member of the American Society of Psychosomatic Dentistry and Medicine.

He is a Past President of the Society for Clinical and Experimental Hypnosis and of the American Boards of Medical Hypnosis. He is the author of 110 scientific papers, past president of the Maryland Association of Private Practicing Psychiatrists and a Life Fellow of the American Psychiatric Association. He was the first practicing psychiatrist in Maryland to be certified by the American Boards of Psychiatry and Neurology (1935), Child Psychiatry (1939) and Medical Hypnosis (1959). Dr. Conn has been in the private practice of Psychiatry since 1933, and was the Acting Chief Medical Officer to the Supreme Bench of Baltimore, Consultant to the Federal Courts and to the Veteran's Administration. Dr. Conn is a 40-year member of the Baltimore City Medical Society, the Medical and Chirurgical Faculty of Maryland and the American Medical Association.

On May 30, 1979, the Alumni Association of the University of Maryland School of Medicine presented Dr. Conn, as a member of the Class of 1929, with a Certificate for 50 Years of Service to the Community.

The following material is meant for both physicians—who should be familiar with all of it— and laypersons, the physicians' patients. The section is perforated for easy tear-out out for patient use or reproduction. This section represents the **Journal's** contribution to the issue so cogently raised by Dr. Bahr in his **Open Forum** letter on page 8 in this edition.—BT.

Community Apathy in Regard to Sudden Death Due to Heart Attack

By RAYMOND D. BAHR, MD, FACP

Dr. Bahr is Director of the Coronary Care System at St. Agnes Hospital, 900 Caton Ave., Balto., MD 21229, where he can be contacted for reprint and other data.

Much information about the cause of heart attacks is missing from the medical literature; however, information about the cause of sudden death from heart attacks is *not* missing. Perhaps even more important is the fact that in the majority of cases, it is a completely reversible event. Why then, do two-thirds of the deaths take place outside the hospital? This is unbelievably shocking. Certain factors are known to exist that perpetuate this #1 killer of the adult population of the United States. Community apathy is present at this important link in emergency cardiac care.

It is well-known that cardiopulmonary resuscitation can save lives. To this extent, efforts have been made

in Maryland to teach as many people as possible the simple techniques of this lifesaving procedure. The Baltimore Sun, The Fire Departments, the Heart Association, etc., are to be congratulated for the push in this direction. It is still considered rather feeble when compared to the city of Seattle, Washington, where 70% of the population are trained in CPR techniques. Probably the most important place to start is at the high school level and, to this extent, certain high schools in Maryland are requiring CPR as part of their curriculum and it thus becomes part of the basic four Rs (reading, riting, 'rithmetic and resuscitation.)

True CPR saves lives, but isn't it better to save a life by bringing them into the hospital early enough to prevent the need for resuscitation? It is well-known that cardiac arrest is time-related and most of the events take place shortly after that attack. It is at this

HEART ATTACK GUIDE

1. Know the Early Warning Signs

2. Call the Ambulance

3. Go to the Hospital

crucial point that community apathy exists. The apathy is derived from two elements; one is lack of knowledge about the early warning signs of a heart attack and, two, the naturally-occurring defensive mechanisms of denial and procrastination that exists in each one of us when confronted with a possible anxious situation such as a heart attack. A combination of these two continues to drive up the high mortality rate in the U S today. How, then, to overcome these two elements? Every home should have a person not only knowledgeable in CPR, but also cognizant of the early warning signs so that there exists an "Executive Spouse." The key here is the "Executive Spouse" and is defined as a person within the family who does not put up with the excuses from a patient having suffered chest pain but immediately calls into play the Emergency Cardiac Care System (911 in some communities and the Fire Department in other communities). Valuable time will be saved and the result will be the salvage of many persons with hearts too good to die.

There exists an excellent Emergency Cardiac Care System in Maryland. Qualified cardiac ambulance attendants stabilize the patient upon the scene. Voice communication as well as EKG transmission is accomplished almost immediately and the nearby hospital is

kept abreast of the situation by a console provided in the Emergency Room.

It would seem that to enhance recognition of the early warning signs and the rapid entry into the Emergency Cardiac Care System with the help of an "Executive Spouse" in each household would go a long way in driving down the high mortality figures from sudden death in our community. To this extent, the community must become enlightened to overcome this apathy relating to the heart attack problem. □

STOP

CENTRAL MARYLAND CHAPTER

Heart Attack!

A Message to John Q. Public

By RAYMOND D. BAHR, MD, FACP

Dr. Bahr is Director of the Coronary Care System at St. Agnes Hospital, 900 Caton Ave., Balto., MD 21229, where he can be contacted for reprint and other data.

Update your knowledge about this potential killer in your household.

Learn what is available in the community.

More important, learn what *you* can do to prevent sudden death in a heart attack victim.

Learn the simple techniques needed to resuscitate a "dead" victim.

Learn how to stay heart-healthy and avoid all of this for you and your family.

Is there any of this that is important to you?

It has been reported that two-thirds of the heart attack victims die before they reach the Hospital. Most people *underestimate* the aspects of sudden death associated with a heart attack. Many of these deaths are *completely avoidable*, since the cause of death is a temporary electrical problem in an otherwise properly-functioning heart. It then becomes very important to know *what to do*. Learn the *Early Warning Signs* of an impending Heart Attack.

The patient usually has chest pain and/or pressure-with discomfort in the middle of the chest. The pain comes on slowly and builds up. It usually cannot be localized and it is often described as diffuse, or "spread out." In many cases the patient will clench his/her fist over the center of the chest.

The pain may radiate to the left arm (inner aspect) or to the jaw.

Often the patient experiences nausea, vomiting, cold sweating and may even pass out.

Unfortunately, the patient does not communicate this discomfort and often will deny the problem. The patient may distinguish the discomfort from pain by saying "it is a pressure," "heavy feeling," "constricting sensation" etc.

In many cases it is passed off as indigestion. Many a dead victim has been found alone, in his home or outside, clenching Tums in his hand. Knowledge of the important *Early Warning Signs* by family members will go a long way to prevent sudden death.

Should the victim stop breathing or lose his pulse, knowledge and application of the simple techniques of resuscitation (namely, establish airway, provide breathing, begin artificial circulation) is a must in order to sustain the victim until help arrives.

When any of the above take place, Help is summoned by calling for an ambulance (in some areas of our state the emergency number 911 is available to contact such emergency vehicles, if this number is not

Early Warning Signs

The patient usually has chest pain or pressure in the middle of his chest. The pain comes on slowly and builds up. It usually cannot be localized and it is often described as diffuse, or "spread out." In many cases, the patient will clench his fist over the center of his chest.

The pain may radiate to the left arm (inner aspect) or to the jaw.

Often the patient experiences nausea, vomiting, cold sweating and may even pass out.

Steps Necessary to Prevent Death From the Number One Adult Killer in the US: Heart Attack!

Learn the Early Warning Signs. Prevent the need for resuscitation by bringing the patient to the hospital at an earlier stage. Overcome denial factors.

Be educated in Cardiopulmonary Resuscitation Techniques.

- Emergency Cardiac Vehicles staffed by certified cardiopulmonary rescue technicians.
- Cardiac consultation via control center at Sinal Hospital of Baltimore to one of four consult hospitals. (Stabilization takes place at the scene of the trouble. It is here that delay may take place in order to bring about stabilization prior to transport).
- Emergency Rooms giving priority to chest pain patient (St. Agnes Chest Pain Emergency Services now being completed).
- Coronary Care System within the hospital setting.

available in your location contact your Local Fire Department for an ambulance). Fortunately, in Maryland, most of the ambulances are staffed with certified cardiopulmonary rescue technicians proficient in emergency cardiac care. The patient's EKG pattern can be transmitted from the ambulance to any one of four cardiac consult centers via the control center located in Sinai Hospital in Baltimore. Once cardiac consultation is obtained and the patient stabilized, the ambulance proceeds to the hospital. The receiving hospital is made aware of the victim's imminent arrival. Maryland is very fortunate in having an excellent Emergency Medical system that provides the necessary link between the patient and the hospital. Great strides have been made in the last several years under the leadership of John Stafford, MD.

One other major ingredient in emergency cardiac care is the hospital Emergency Room. It is here that top priority is given to the cardiac patient, in terms of resuscitation as well as in terms of prevention of the problem. No longer is the chest pain victim routinely passed over in favor of patients needing surgical care. Most hospital emergency rooms in Maryland have updated their efforts, giving the cardiac patient top priority.

At St. Agnes Hospital in Baltimore, a specialized area (Chest Pain Emergency Services) has been built for treatment of Emergency Cardiac Patients. Personnel trained in Advanced Life Support staff this area. Admitted patients are transported via a special elevator to the Coronary Care Unit. This approach will prevent cardiac patients from being bottlenecked in the emergency room with patients having a variety of other medical emergency problems.

Let's now review the steps necessary to prevent death from the number one adult killer in the US: Heart Attack!

As private citizens and potential victims:

- * Learn the Early Warning Signs. Prevent the need for resuscitation by bringing the patient to the hospital at an earlier stage.
- * Educate yourself in Cardiopulmonary Resuscitation (CPR) Techniques.
- * Emergency Cardiac vehicles staffed by certified cardiopulmonary rescue technicians.
- * Cardiac consultation via control center at Sinai Hospital of Baltimore to one of four consult hospitals. (Stabilization takes place at the scene of the trouble. It is here that delay may take place in order to bring about stabilization prior to transport).
- * Emergency Rooms giving priority to chest pain patients.
- * Coronary Care System within the hospital setting.

The public needs to be aware that Coronary Artery Disease may be prevented or slowed down by correcting the major risk factors associated with this disease, namely: hypertension, cigarette smoking and high levels of serum blood cholesterol. It has been shown that regular physical exercise is beneficial in helping to prevent Coronary Artery Disease and also in recon-

ditioning the Coronary Artery Disease victim. To this end, Catonsville Community College in Baltimore County, for example, has established a supervised exercise program.

John Q. Public, Learn to do your part in Heart Disease Prevention and treatment. Health is the Greatest Gift in Life. You may bring about a Happy (Heart) Ending. □

The Chest Pain Emergency Room

By RAYMOND D. BAHR, MD, FACP

Dr. Bahr's Director of the Coronary Care System at St. Agnes Hospital, 900 Caton Ave., Balto., MD 21229, where he can be contacted for reprint and other data.

Where is the Chest Pain Emergency Room? What is its purpose? How will it function? How will it bridge the gap between St. Agnes Hospital and the St. Agnes community?

These are all questions being raised concerning the structure now being built on the north side of the building facing Wilkens Ave. It connects directly with the Emergency Room and thus forms *part* of the Emergency Room, an extension, you might call it, which gives priority care to a highly-selective Emergency Room problem which deals with sudden death. On the south side of this, there is a two-story structure which connects with the second floor. This connection is via an elevator which will provide rapid entrance from the Chest Pain Emergency Room to the Coronary Care System on the second floor. What prompted St. Agnes Hospital to undertake such an innovative approach to the problem of Coronary Care? It has been long recognized that the major problem with coronary artery disease lies *with the community* and *not* with the hospital. This is not to say that lives are not saved within the hospital, but gives due importance to the weight of the problem's being in the community.

It is estimated that two-thirds of the patients who die with coronary artery disease do so before reaching the hospital. Approximately 50% die instantaneously within one minute; another 20% within the first two hours, with frequency falling off after the first six-eight hours. Unfortunately, most studies show that the approximate time of arrival to the Emergency Room of patients suffering a heart attack is about six hours, thus the major killing force has already struck its blow and wiped off the face of the earth many a patient with a heart too good to die.

In order to correct such a problem, the Hospital must extend itself into the community and *educate the populace* in: 1) What to do when the patient is having a cardiac arrest and 2) Concepts of coronary care that preach the importance of seeking early medical attention shortly after the insult has taken place. The solution to the first of these problems has been shown by the people of Seattle to be very effective: 70% of the Seattle population know how to do cardiopulmonary resuscitation. No longer are these simple techniques relegated to the physician or his/her designated personnel, but must be given through qualified courses certifying as many lay people as possible. A solution to the second of these problems is perhaps more difficult to come up with. True, we do preach that all patients with chest pain seek emergency medical help, but as

one knows, it can be very frustrating and catastrophic when the Emergency Room is full and there is "no place in the lin." With this in mind, the concept of a Chest Pain Emergency Room was designed to incorporate the following principles:

1. A large resuscitation area
2. An observation area for patients with chest pain
3. A rehabilitation area
4. A cardiac consult area where nurses can keep in contact with incoming ambulance calls as well as EKG rhythms
5. A dedicated elevator that expedites patients immediately to the Coronary Intensive Care Area (Phase F.)

In a busy hospital such as St. Agnes, in order to have a rapid entry of patients early in the course of their illness, it is important to also have a rapid discharge capability that will keep up with the rapid entry. We hope to do this by cutting down on the length of stay on certain subsets of good risk patients as well as providing rapid rehabilitation for uncomplicated MIs so as to allow patients in the early course of their illness to be admitted.

There is no question that we will have a greater impact on sudden death in the community if we are able to reach patients at an earlier stage of their illness. The Chest Pain Emergency Room will also allow for proper identification of the true MI suspects rather than subject the patient to a cutoff time of 12 hours. The latter at times has caused dilution of non-MIs in the Unit as well as having sent home patients with unstable anginal pictures.

The hallmark of this area will be a team of Chest Pain Emergency Room Nurses who will be dedicated to emergency care of the cardiac patient. Monitoring equipment will be available to allow rapid identification and treatment of life-threatening arrhythmias. It is better to save a life by preventing a resuscitation than by having a patient deteriorate to the point where resuscitation is inevitable.

The entire concept of the Chest Pain Emergency Room is an innovative one that will suffer some growing pains in its early stages. These growing pains will not be insurmountable when one considers the nature of the problem (sudden death and a heart that's too good to die), the easy reversibility by drug therapy early in the course of the illness and the expertise of the Emergency Room physicians, Chest Pain Emergency Room nurses, Coronary Care residents, Cardiologists, etc., as well as administrative personnel working together to iron out the fine wrinkles, knowing full well that they are providing optimum cardiac care to people in our community. □

Heart Attack!

From the American Heart Association—

Central Maryland Chapter:

Hospital Emergency Rooms Should Meet Quality Standards

Hospital emergency rooms in Central Maryland are now displaying new red, white and blue signs which stand for quality cardiac care, according to Hilary T. O'Herlihy, MD, Chairman of the Emergency Cardiac Care Advisory Committee of the American Heart Association, Central Maryland Chapter.

"Hospitals displaying these signs are using Heart Association standards for emergency cardiac care," said Dr. O'Herlihy. "In meeting these standards, a hospital is expressing a belief in priority treatment for suspected cardiac patients."

Participation in the program is entirely voluntary. The program is sponsored jointly by the American Heart Association, Central Maryland Chapter and the Maryland Institute for Emergency Medical Services (MIEMS).

Dr. O'Herlihy said, "Anyone who comes into one of these hospitals complaining of chest pains is immediately admitted to the emergency rooms, bypassing routine red tape such as insurance forms, etc. This is important because of the high incidence of sudden death early in acute cardiac events. Many of these people are actually undergoing a heart attack when they walk into the hospital."

According to Dr. O'Herlihy, "In part, the standards indicate that a hospital emergency room is open and staffed with qualified personnel 24 hours a day. These staff people are trained to handle emergency cardiac cases and have all the necessary equipment and drugs readily available."

Dr. John Stafford, MD, Director for MIEMS Systems Program and a member of the American Heart Association, Central Maryland Chapter Emergency Cardiac Care Advisory Committee, said "Paramedic telemetry ambulances operating in Central Maryland transported 6,000 suspected cardiac patients to these emergency rooms last year." All the emergency rooms visited used the red box system. "When someone suspects a heart attack, he should immediately call an ambulance. Specially-trained paramedics can respond to an ambulance call in minutes. Upon arriving at the scene, these paramedics can immediately begin transmitting important information—blood pressure, pulse, heart rhythm—to a receiving hospital."

Dr. Stafford added, "In the hospitals we visited, we found that the receiving personnel were ready for a patient's arrival."

He urged people to learn how it feels to have a heart attack. "The way a heart attack feels can vary. If someone feels an uncomfortable pressure, fullness, squeezing or pain in the center of the chest that may spread to the shoulders, neck or arms, and if it lasts

for two minutes or more, he could be having a heart attack. Severe pain, dizziness, fainting, sweating, nausea or shortness of breath may also occur. Sharp, stabbing twinges of pain are usually *not* signals of a heart attack."

Dr. Stafford warned, "Surviving a heart attack may depend on getting medical attention quickly. Call an ambulance immediately. (See Table 1). Too many people refuse to accept the possibility that they are having a heart attack. Many people say it's indigestion or tension. They worry about embarrassment. They often wait three hours or longer before getting help, but before those three hours are up, one out of three is dead."

Dr. O'Herlihy explained, "All hospital emergency rooms were voluntarily visited by medical teams representing the American Heart Association, Central Maryland Chapter Emergency Cardiac Care Advisory Committee. These hospitals met the standards."

The mission of the American Heart Association is to reduce and ultimately eliminate premature death and disability from cardiovascular diseases. Nearly 7,100 people in Central Maryland died last year from cardiovascular diseases; 2,300 of these deaths were from heart attack. Half of these people died before entering the emergency medical system.

Because of its mission and its concern for the management of a heart attack patient, the American Heart Association developed these standards for emergency cardiac care in advanced life support units including hospital emergency rooms.

For further information about the warning signals of a heart attack and the emergency medical system, call the Heart Association at 685-7074. ☐

DOCTORS TAKE NOTE:

Oct. 26-27, Practical Clin. Endocrinology, Internat. Hotel, BWI Airport. For further info., contact the Prog. of Cont. Educ. at (301) 528-3956 at Univ. of MD Sch. of Med.

MEDICAL OFFICES AVAILABLE

NEAR SINAI - 2 - 1,200 sq. ft. & 800 sq. ft. MD. GENERAL BOULEVARD MEDICAL CENTER
- 3,000 sq. ft. Will alter to suit tenant as one unit or will subdivide. All modern with conveniences on bus lines.

1,000 sq. ft. also avail. in Blvd. Medical Center in Glen Burnie & office to share on Loch Raven Blvd.

Hearts Attack!

Stop Heart Attack Deaths Campaign Put Into Action

Remember:

If you feel an uncomfortable pressure, squeezing, fullness or pain in the center of the chest, lasting for two minutes or more, you could be having a heart attack. Dizziness, fainting, sweating, nausea and shortness of breath may also occur.

The key to surviving a heart attack is to act immediately. Survival often depends on how quickly heart attack symptoms are recognized and how fast medical assistance is summoned. Approximately 350,000 people die each year from heart attacks before ever reaching the hospital. Many of these deaths happen suddenly, although seldom without some previous warning. Symptoms are too often ignored by the victim.

You can improve your chances of surviving a heart attack by recognizing the early warning signals and seeking emergency medical help immediately.

The American Heart Association-Central Maryland Chapter has launched a campaign to educate the inner-city community to recognize the warning signals of a heart attack, and know the telephone number to call to activate the Emergency Medical Services System's Cardiac-Equipped Ambulances.

The program, *Stop Heart Attack Deaths*, began in February, 1979. According to Project Director B. Wayne Kong, Ph.D. of Baltimore's Provident Hospital, the project's over-all effectiveness will be measured in a survey study by the University of Maryland Hospital

under the direction of Aristicle Apostolides, DVM, Ph.D.

A baseline survey, prior to the campaign, revealed that 20.4% of the people interviewed could recognize the signals of a heart attack if they were experiencing them, while 53% thought they would recognize someone else's symptoms. All those questioned thought they knew the name of the hospital closest to them, but no one knew the number to call for emergency medical assistance. (See Tables 2 and 3.)

Chairing the Early Warning Signals Planning and Coordinating Committee in Baltimore is Mrs. Vashti McKenzie. Other committee members are: Rev. John Bryant, Bethel AME; Irving Conway, Center 28, Urban Services Agency; Rev. St. George Cross, Lewin United Methodist Church; David Fuellhart, WPOC Radio; Mrs. Jacki Hill, Coppin State University; William Hathaway, MIEMS; John Murphy, III and Mrs. Ida Peters, executives of the *Afro-American Newspapers*; Mr. Al Raison; Chuck Richards, Baltimore Contractors; Elijah B. Saunders, MD, FACC, of Provident Hospital; Mrs. Betsy Simon, Baltimore City Public Schools; Melvin Wachs, Urban Services Agency; Mrs. Elizabeth A. Ward, Assistant to Delegate Hattie Harrison; Corinda Waters, Ph.D and Joseph Woodfolk.

If anyone is interested in receiving a free wallet card or a stick-on decal (see illustrations) detailing the early warning signals and the appropriate action to follow, please write or call the Chapter Office (American Heart Association-Central Maryland Chapter, 415 N. Charles St., PO Box 17025, Balto., MD 21203, (301) 685-7074.)

Large quantities can be ordered for organizations or special interest groups. ☐

MARYLAND MEDICAID & MEDICARE APPROVED

BODY CT/NEURO CT

A TWO-PART SYMPOSIUM ON COMPUTED TOMOGRAPHY
OCTOBER 10-12, 1979

PRESENTED BY THE DEPARTMENT
OF DIAGNOSTIC RADIOLOGY
AND THE PROGRAM OF
CONTINUING EDUCATION

UNIVERSITY OF MARYLAND
SCHOOL OF MEDICINE

BODY CT

PROGRAM

NEURO CT

October 10, morning

Welcome—John M. Dennis, M.D., and Joseph Whitley, M.D.

Moderator: Nancy Whitley, M.D.

CT of the Larynx — Stephen Cisternino, M.D.

CT of the Pulmonary Nodule — Stanley Siegelman, M.D.

CT of the Mediastinum and Pleura — Charles Putman, M.D.

CT Scanning of the Pancreas — Ralph Alfidi, M.D.

CT Scanning of Kidneys and Adrenals — Stanley Siegelman, M.D.

Comparative Aspects of Ultrasound and CT of the Retroperitoneum — Conrade C. Jaffe, M.D.

October 10, afternoon

Moderator: Morgan Dunne, M.D.

CT of the Pelvis — Nancy Whitley, M.D.

CT in Musculoskeletal Neoplasms — Peter Mueller, M.D.

Sequential CT Scanning after IV Contrast — Ralph Alfidi, M.D.

Clinical Application of Multiplanar Reconstruction in CT of the Abdomen — Conrade C. Jaffe, M.D.

Interventional CT — Peter Mueller, M.D.

October 11, morning

Moderator: Stephen Cisternino, M.D.

Global Abdominal Anatomy by Ultrasound and Computed Tomography — Morgan Dunne, M.D.

Computed Tomography of Trauma — Edward Druy, M.D.

New Developments in CT Technology — John Perry

The Use of CT in Radiation Therapy Planning — Ralph Scott, M.D.

October 11, midday: Workshop sessions at the University of Maryland Hospital and Johns Hopkins Hospital will demonstrate CT diagnostic activities in clinical settings.

Location: INTERNATIONAL HOTEL, Baltimore-Washington International Airport.

Pre-registration: Early pre-registration by mail is encouraged since conference facilities necessitate limited enrollment. Registration, with a \$15 late fee, will be possible on a space available basis at the International Hotel, 7:30 am, October 10 and 10:00 am, October 11.

Fee:

	Physicians	Residents, Interns and Other Professionals
Full 3-day course:	\$200	\$135
Body CT session only:	\$125	\$ 80
Neuro CT session only:	\$125	\$ 80

The total registration fee, payable in advance, includes the cost of instructional materials, coffee breaks, lunches, and reception.

Credits: 20 credit hours in Category I of the Physician's Recognition Award, American Medical Association, for the entire course.

Supported by an educational grant from Pfizer Medical Systems, Inc.

October 11, afternoon

Moderator: Krishna C.V.G. Rao, M.D.

Functional CT Anatomy — Mokhtar H. Gado, M.D.

Sensitivity and Specificity of CT Scanning in Intracranial Neoplasm — Sadek K. Hilal, M.D., Ph.D.

CT in Sellar and Parasellar Lesions — Fred J. Hodges, III, M.D.

Normal and Abnormal CT Anatomy of Intracranial Structures — Sadek K. Hilal, M.D., Ph.D.

October 12, morning

Moderator: Richard F. Mayer, M.D.

CT in Stroke — Irvin Kricheff, M.D.

Intracranial Anomalies — Derek C. Harwood-Nash, M.D.

CT in Certain Pediatric Conditions — Krishna C.V.G. Rao, M.D.

Moderator: Harvey H. Levine, M.D.

CT in Head Trauma — Pulla R.S. Kishore, M.D.

CT in Degenerative Brain Disease — Giovanni DiChiro, M.D.

CT in Infection — S.H. Lee, M.D.

October 12, afternoon

Moderator: Thomas B. Ducker, M.D.

Computed Tomography/Metrizamide in Evaluation of

Pediatric Spine — Derek C. Harwood-Nash, M.D.

CT/Metrizamide in the Adult Spine — Mokhtar Gado, M.D.

Use of Metrizamide and Alternative Methods of Evaluating Posterior Fossa Lesions — Irvin Kricheff, M.D.

Recent Trends in Neuro-imaging Modalities — Giovanni DiChiro, M.D.

Moderator: Giovanni DiChiro, M.D.

Doctors in the News

Dr. Johnson Honored

Dr. Eliot W. Johnson, a family practitioner who for the past 52 years has served the medical needs of thousands of Baltimoreans, was honored with a retirement testimonial dinner at Martin's West in Baltimore County recently for his over half-a-century of dedication.

Operating his practice from his office at 3432 Frederick Rd. in Baltimore for most of his 52 years in medicine, Dr. Johnson has been noted for his involvement in the proceedings that led to the canonization of St. Elizabeth Ann Seton, the first American-born saint. He also holds the distinction of being the first medical resident at Baltimore's St. Agnes Hospital, operated by the Daughters of Charity.

Born and raised on a 1,000-acre farm 25 miles south of Raleigh, NC, Dr. Johnson attended the University of North Carolina at Chapel Hill and went on to obtain his Medical Degree from the Medical College of Virginia. In June, 1923, he was accepted as the first medical resident at St. Agnes Hospital.

Following his residency, which covered not only medicine but also obstetrics, Dr. Johnson established his practice in southwest Baltimore.

One of Dr. Johnson's most distinguished cases involved Severna Park resident Mrs. Anne O'Neill Hooe. In her preteen years, Mrs. Hooe was stricken with a severe case of Leukemia. The girl's parents brought the child to Dr. Johnson, who had delivered her. He referred her to Dr. Milton Sachs head of the Department of Hematology at the University of Maryland Hospital. Dr. Sachs administered experimental medication to the girl, but the response was negligible and her condition worsened. She was admitted into the St. Agnes Hospital pediatric floor, where one of the Daughters of Charity, the Catholic order of nuns who founded St. Agnes Hospital, initiated a novena to Elizabeth Ann Seton to restore the girl's

DR. JOHNSON

health. Soon afterward the young girl's condition began to improve, and today she lives comfortably with her husband and children, having no recurrence of the disease to date.

This healing was determined to be a miracle following an investigation of the authenticity of the event, at which time Dr. Johnson's testimony was used as evidence. The healing served as the second miracle of three performed through Mother Seton. On Sept. 14, 1975, Pope Paul VI canonized Elizabeth Ann Seton as the first American-born saint. Mrs. Hooe attended the ceremony.

Dr. Schanno Appointed

Joseph F. Schanno, MD, Bethesda, has been appointed as a Governor of the American College of Angiology for Maryland for the year 1979-80.

Dr. Williams Named

Dr. Ralph H. Williams of Hagerstown will be named a Fellow of the American College of Radiology at its Annual Meeting in Chicago Sept. 19th. A 1954 graduate of the Jefferson Medical College of Thomas Jefferson University in Philadelphia, Dr. Williams is affiliated with the Washington County Hospital and the Brooklane Psychiatric Center, both in Hagerstown, as well as the VA Center in Martinsburg, WV.

QuinammTM

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATIONS: For the prevention and treatment of nocturnal recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis, and static foot deformities.

CONTRAINDICATIONS: Because of the quinine content, Quinamm is contraindicated in women of childbearing potential, in pregnancy, in patients with known quinine sensitivity, and in patients with glucose-6-phosphate dehydrogenase deficiency. Hemolysis (with the potential for hemolytic anemia) has been associated with a G-6-PD deficiency in patients taking quinine.

PRECAUTIONS: Thrombocytopenic purpura may follow the administration of quinine in highly sensitive patients. Recovery will follow withdrawal of the medication.

Cinchona alkaloids, including quinine, have the potential to depress the hepatic enzyme system that synthesizes the vitamin K-dependent factors. The resulting hypoprothrombinemic effect may enhance the action of warfarin and other oral anticoagulants.

ADVERSE REACTIONS: Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. If ringing in the ears, deafness, skin rash, or visual disturbances occur, the drug should be discontinued.

DOSAGE AND ADMINISTRATION:

1 tablet upon retiring. When necessary, 1 additional tablet may be taken following the evening meal.

Product Information as of September, 1977
U.S. Patent 2,985,558

for Knotts in the night

QuinammTM

each tablet contains quinine sulfate 260 mg , aminophylline 195 mg.

specific therapy for painful night leg cramps

Nocturnal recumbency leg muscle cramping is frequently an unwelcome bedfellow for many patients—especially those with arthritis, diabetes or peripheral vascular disease . . . consider Quinamm . . . simple, convenient dosage—usually just one tablet at bedtime . . . can provide restful, welcome sleep without night leg cramps.

See opposite page for prescribing information

COMPATIBILITY

Does it influence your choice of a peripheral/cerebral vasodilator*?

- Vasodilan—compatible with coexisting diseases
- Vasodilan—compatible with concomitant therapy
- Vasodilan—compatible with your total regimen for vascular insufficiency

*Indications: Based on a review of this drug by the National Academy of Sciences-National Research Council and/or other information, the FDA has classified the indications as follows:

Possibly Effective:

1. For the relief of symptoms associated with cerebral vascular insufficiency.
 2. In peripheral vascular disease of arteriosclerosis obliterans, thromboangiitis obliterans (Buerger's Disease) and Raynaud's disease.
- Final classification of the less-than-effective indications requires further investigation.

Composition: Vasodilan tablets, isoxsuprine HCl, 10 mg. and 20 mg. Vasodilan injection, isoxsuprine HCl, 5 mg., per ml.

Dosage and Administration: Oral: 10 to 20 mg., three or four times daily. Intramuscular: 5 to 10 mg. (1 or 2 ml.) two or three times daily. Intramuscular administration may be used initially in severe or acute conditions.

Contraindications and Cautions: There are no known contraindications to oral use when administered in recommended doses. Should not be given immediately postpartum or in the presence of arterial bleeding.

Parenteral administration is not recommended in the presence of hypotension or tachycardia.

Intravenous administration should not be given because of increased likelihood of side effects.

Adverse Reactions: On rare occasions oral administration of the drug has been associated in time with the occurrence of hypotension, tachycardia, nausea, vomiting, dizziness, abdominal distress, and severe rash. If rash appears the drug should be discontinued.

Although available evidence suggests a temporal association of these reactions with isoxsuprine, a causal relationship can be neither confirmed nor refuted.

Administration of single dose of 10 mg. intramuscularly may result in hypotension and tachycardia. These symptoms are more pronounced in higher doses. For these reasons single intramuscular doses exceeding 10 mg. are not recommended. Repeated administration of 5 to 10 mg. intramuscularly at suitable intervals may be employed.

Supplied: Tablets, 10 mg., bottles of 100, 1000, 5000 and Unit Dose; Tablets, 20 mg., bottles of 100, 500, 1000, 5000 and Unit Dose; Injection, 10 mg. per 2 ml. ampul, box of six 2 ml. ampuls.

U.S. Pat. No. 3,056,836

VASODILAN[®]

(ISOXSUPRINE HCl)

Mead Johnson PHARMACEUTICAL DIVISION

Second Conference on the Canadian Health Care System, Toronto, Ontario, November, 1978

By ELZA DAVIS

Ms. Davis is Med-Chi Communications Director. She can be contacted for reprint and other data at the Faculty Bldg. 1211 Cathedral St., Balto., MD 21201.

A seminar was sponsored by the American Medical Association and conducted by Hickling-Johnston, Ltd., Management Consultants in November, 1978 to provide leaders of the medical profession with a firsthand experience of the Canadian Health Care Service and to review its development, accomplishments and problems. The focus of the program was on the government-financed health care system and its relevancy to the restructuring of the American system of health care and was held in Toronto, Ontario.

Background

The Canadian system as it exists today was born of concern on the part of the public for better and more available health services boosted by the increasingly-popular political ideal of universal medical coverage. The program was implemented in two stages: the Hospital Insurance and Diagnostic Services Act of 1957 and the Medical Care Act of 1966-67.

As early as the 1920s, commercial sickness and accident insurance policies were available to Canadians! "The first government-sponsored medical-hospital insurance plan in North America was introduced in Newfoundland in 1934.¹ In the late 1930s, several forms of voluntary insurance programs were implemented, including prepaid provincial medical association insurance programs and not-for-profit Blue Cross plans. In the Western Provinces, particularly, local governments were used to sponsor programs to pay for hospital care. In these sparsely-populated areas, local government agencies acted as pay agents for the needy. They raised funds locally by special taxes earmarked for health care. Hospital pre-payment plans were sponsored in mining and lumbering communities with funds raised through public celebrations and the sale of "tickets" for care to be rendered. By 1945, the Advisory Committee on Health Insurance prepared a report leading to the first concrete proposals by the Federal government for a comprehensive, nationwide health insurance program. In 1948, the Federal government established a system of Federal grants-in-aid to finance health care which was described at the time as "A fundamental prerequisite of a nationwide system of health insurance."² The grants-in-aid program served to bolster the Provincial plans which were facing physical plant depletion and diminishing personnel.

By 1956, a Federal proposal was made in which "Priority of attention should be given to the development of plans to cover diagnostic service and hospital care, and that only after the establishment of some form

of hospital insurance, should further consideration be given to what additional steps should be taken."³

The Federal Hospital Insurance and Diagnostic Services Act was passed unanimously by the House of Commons on Apr. 12, 1957 and implemented on July 1, 1958.

With the hospital insurance program in operation, the Federal government turned its attention to medical services. The Canadian Medical Association requested that a Royal Commission study the health field. The request, dated Dec. 12, 1960, sought in part, an assessment of "The health needs and resources of Canada with a view to recommending methods of ensuring the highest standard of health care for all Canadians . . ."⁴ The Medical Association not only declared its official position in this document, but offered its full cooperation in any forthcoming undertaking. Following the course of development for the hospital insurance plan, medical insurance plans were implemented on a provincial basis. Saskatchewan, the only Socialist government in Canada at that time, was the first to establish such a plan. A great deal of negotiating and hard bargaining, including a strike by physicians, finally culminated in the Saskatoon Agreement of 1962. The Agreement provided for universal medical coverage paid by the provincial government. Physicians had the option to bill the plan for their services, or to bill the patient directly with the patient collecting from the plan. The Federal Medical Care Act was introduced in 1965 and was followed by a period of controversy between the medical profession and the Federal government regarding the conditions of entry into the government plan. The Act was passed in December, 1966 and became effective on July 1, 1968.

Benefits of the Government Health Insurance Plans

In Canada, both necessary medical care and hospitalization are provided without limit to all who are qualified subscribers. The programs are administered on an individual basis by each province with a combination of Provincial and Federal funds. Provinces must meet minimum standards to participate in the plans. Minimum criteria are given in Table 1.

To be a qualified subscriber, a person must have been a resident of the Province for at least three months. Physicians are free to locate anywhere in Canada. If the physician is paid through the government insurance mechanism, the fee is negotiated on a periodic basis with the Provincial Medical Association. The government pays between 80%-90% of the negotiated fee schedule. If the physician elects to "opt-out" of the system, he/she may charge the patient whatever fee he/she deems appropriate. He/she must

inform the patient he/she is not a participating physician and the amount of fee expected. The patient may then elect to stay with the physician, paying him/her directly and collecting the scheduled amount from the government, or the patient may look for a participating physician. About 90% of all physicians participate in the government plan. Hospitals remain private institutions governed in much the same way as hospitals in the United States, with Boards of Directors.

Financing of the Canadian National Health Insurance

Direct control of financing the health plans rests with each Provincial government. Funds come from general tax revenues, premium payments (paid either by

employer or individual or both) earmarked income tax surcharges, payroll tax, co-payments or a combination of many. The exact services provided varies among the Provinces. A partial summary of the benefits offered and premium requirements is given in Table 2; - Summary of Provincial Health Care Plans.

In addition to Provincial financing of the health insurance plans, until 1977, the Federal government supported the Provincial hospital programs on the basis of 25% of the national per capita cost of in-patient services and 25% of the per capita cost of in-patient services in each Province. This percentage-sharing arrangement means high cost Provinces receive a lower percentage of their costs from the Federal government and low cost Provinces receive a higher share. The more a Province's costs exceed the national costs, the lower is the percentage of the Federal contribution. Hospital insurance provides for basic ward care in-hospital. For patients desiring semi-private or private rooms, the difference may be paid out of pocket, or through additional private insurance plans. The medical plans were partially-financed by the Federal contributions based on half the national average per capita cost of insured services multiplied by the average number of insured persons in each Province.

Beginning with the 1977-78 Fiscal Year, the Federal government discontinued the open-ended cost-sharing mechanism with the Provinces. In an effort to protect the Federal treasury from escalating health costs, the Federal arrangement is now called Established Programs Financing (EPF). Under this provision, the Federal government transfers tax credit points to the Provinces and supplements with fixed per capita grants tied to the Gross National Product (GNP) the responsibility for financing is effectively switched from Federal to Provincial control.

Canadian Health Insurance — Today and Tomorrow: Hospitals

The focal point of health care in Canada is the hospital. Even before the passage of the Hospital Insurance and Diagnostic Services Act of 1957, the Federal government was supporting hospitals through the grants-in-aid program. During the years 1948-66, Federal grants were made to the Provinces in the total amount of approximately \$824,378,000 to be used for various purposes including hospital construction, laboratory and X-ray services, cancer control and others.⁵ The implementation of the universal insurance program brought with it an increased demand for hospital services. The decade of the 1960s saw the closing of smaller, inefficient hospitals and the expansion of large and moderately-sized institutions. During the period 1961-72, bed-population ratio rose from 6.6 to 6.9 per 1,000.⁶ Medical staffs expanded to meet increasing needs from 12.65 personnel hours per patient-day of hospitalization in 1961 to 14.63 hours in 1972.⁷ Canadian hospitals are managed in much the same way as American hospitals, with a Board of Directors and a hospital administrator responsible to the Board. Staffing is open with physicians applying for privileges.

Table 1: Minimum Criteria for Federal Grant Eligibility Hospital Insurance and Diagnostic Services, 1957

1. Accommodations and meals at the standard or public ward level.
2. Necessary nursing service.
3. Laboratory, radiological and other diagnostic procedures, including the cost of professional interpretations where they are essential.
4. Drugs, biologicals and related preparations as provided in an agreement when administered in a hospital.
5. Use of operating room, case room and anesthetic facilities, including necessary equipment and supplies.
6. Routine surgical supplies.
7. Use of radiotherapy and physiotherapy facilities where available.
8. Services rendered by persons who receive remuneration therefore from the hospital.
9. Such other services as are specified in an agreement.

Medical Care Act, 1967

1. Comprehensive coverage for all medically-required services rendered by a physician or surgeon. There can be no dollar limit or exclusion except on the grounds that the services were not medically-required. The benefit coverage must be administered in such a way that there will be no financial impediment or preclusion to an insured person receiving necessary medical care. Certain surgical/dental services rendered by dental surgeons in hospitals have been included as benefits from July 1, 1968.
2. Universal availability to all eligible residents of a participating province on uniform terms, conditions and covering; in addition, at least 95% of the total eligible population. This ensures access to coverage by all residents and prevents premium discrimination on account of previous health, age, non-membership in a group of other consideration. At the same time, subsidization in whole, or in part, for certain age groups or low-income groups is permitted, if a plan is financed by means of a premium system, provided all qualifying residents are treated equally.
3. Portability of benefits when the beneficiary is temporarily absent from his own Province and when he is moving from one participating province to another. It is not related to employment insurance groups and, consequently, coverage, is not lost when an individual changes jobs or residence.
4. Administration on a non-profit basis by a public authority which is accountable to the provincial government for its financial transactions.

TABLE 2: Summary of Provincial Health Care Plans

PROVINCE AND DATE OF ENTRY	ANNUAL PREMIUM	HOSPITAL BENEFITS COST SHARED	AUTHORIZED CHARGES FOR HOSPITALIZATION	EXTRA BENEFITS (MEDICAL CARE)	EXPENDITURES . . ON
					1) MEDICAL CARE 2) HOSPITAL CARE (1976-77)
British Columbia July 1, 1968 (Med. Care) July 1, 1958 (Hosp. Ins.)	Single \$ 90 Couple \$180 Family \$225 (Full rates)	In-patient: standard ward and all approved available services. Out-patient: emergency services, minor surgical procedure, day-care surgical services, out-patient cancer therapy, psychiatric day care and night care services, day care rehabilitation services, narcotic addiction services, physiotherapy services, diabetic day-care, and specified out-patient psychiatric services (in designated hospitals). Also dietetic counselling and cytology services, renal dialysis treatments.	a) \$4 per day for standard ward care for adults and children, excluding newborn. b) \$2 for each emergency or minor surgical out-patient treatment. c) \$2 for day care surgical services. d) \$1 for out-patient cancer therapy. e) \$1 for psychiatric day care or night care and psychiatric out-patient services. f) \$1 for out-patient physiotherapy services. g) \$1 for diabetic day care services. h) \$1 for day care rehabilitation services. i) \$6.50 per day for adults and \$1 per day for children under the age of nineteen in extended care hospitals.	Optometry, chiropractic, naturopathy, physiotherapy, podiatry, orthoptic treatment and services of Red Cross nurses, special nurses and V.O.N. Orthodontic services for cleft palate and/or harelip. (Free prescription drug program for residents over 65 and a drug subsidy program for those under 65, the handicapped and the chronically ill, and a universal Pharmacare plan which protects individuals from financial hardship as a result of high prescription drug expenses).	1) \$254 million 2) \$554 million
Alberta July 1, 1969 (Med. Care) July 1, 1958 (Hosp. Ins.)	Single \$ 91.80 Family \$183.60 (Full rates)	In-patient: standard ward and all approved available services. Out-patient: 100% of all out-patient procedures rendered by the hospital, 100% of all diagnostic and physiotherapy services rendered in approved facilities outside the hospital, 100% of all out-patient services provided by provincial cancer clinics and provincial laboratories, dietetic counseling services, extensive home care benefits.	Adults and children, excluding newborn: \$5 for the first day in active treatment hospitals. Auxiliary hospitals: \$5 per day after 120 days.	Dental services rendered by dental surgeons as specified in regulations, optometric and chiropractic services and podiatric services and appliances. An optional health services contract is available through the commission providing Alberta Blue Cross plan membership at reduced rates to residents who are not members of a group. For residents over 65 and their dependents, the government provides a major portion of the cost of eyeglasses and assumes the cost of hearing aids, dentures and dental care and medical and surgical equipment, supplies and appliances.	1) \$149 million 2) \$420 million
Saskatchewan July 1, 1968 (July 1, 1962) (Med. Care) July 1, 1958 (Hosp. Ins.)	No premium	In-patient: standard ward and all approved available services. Out-patient: to the extent that a hospital is able to provide it.	None	Optometry, chiropractic, referred services by dentist for care of cleft palate and for orthodontic oral surgery. Subsidized hearing aid program, provision of prosthetic and orthotic devices, wheelchairs, walkers, commodes and other aids to daily living, a dental plan for children and a prescription drug plan.	1) \$65 million 2) \$197 million
Manitoba Apr. 1, 1969 (Med. Care) July 1, 1958 (Hosp. Ins.)	No premium	In-patient: standard ward and all approved available services. Out-patient: all services except drugs and dressings in certain cases. Extensive nursing home benefits.	None	Optometry, chiropractic, prosthetic devices and certain limb and spinal orthotic devices and services when prescribed by an M. D. Contact lens following congenital cataract surgery. Artificial eyes. Personal care and special devices programs. Pharmacare program that covers all persons. — \$50 deductible per family or individual — 85% of cost of prescriptions is paid by the plan after deductible — drugs covered are most drugs except OTC	1) \$74 million 2) \$232 million (Continued on next page)

(TABLE 2 Continued)

PROVINCE AND DATE OF ENTRY	ANNUAL PREMIUM	HOSPITAL BENEFITS COST SHARED	AUTHORIZED CHARGES FOR HOSPITALIZATION	EXTRA BENEFITS (MEDICAL CARE)	EXPENDITURES . . . ON 1) MEDICAL CARE 2) HOSPITAL CARE (1976-77)
Ontario Oct. 1, 1969 (Med. Care) Jan. 1, 1959 (Hosp. Ins.)	Single \$228 Family \$456	In-patient: standard ward and all approved available services. Out-patient: broad range of essential services, physio-occupational, speech, radio-, and inhalation therapies, and other hospital services when medically necessary. Where available the provision of quipment, supplies and medications for use in the home by haemophilic patients for the emergency treatment or the prevention of haemorrhage; extensive nursing home benefits.	None	Optometry, chiropractic, chiropody, podiatry, osteopathy and specified dental services performed in hospital (also out of hospital benefit towards cost of physiotherapy and for ambulance services) Home Care Program Services, home renal dialysis and home hyperalimentation equipment, supplies and medication. Free Drug Benefit Plan for persons 65 years and over, disabled persons and persons with limited incomes.	1) \$717 million 2) \$1,873 million
Quebec Nov. 1, 1970 (Med. Care) Jan. 1, 1961 (Hosp. Ins.)	No premium 1.5% of earnings in-come tax sur-charge (plas-tic registr cards) also 1.5% of total salaries paid by employer. Maximum surcharge is \$235 (1977)	In-patient: standard ward including all available services. Out-patient: certain psychiatric services, emergency (24 hrs.), minor surgery including X-ray and laboratory examinations and related interpretation, physiotherapy, radiotherapy, medical orthotics, occupational therapy audiology and speech therapy, services or examinations necessary to obtain employment, or required during the course of employment, or as requested by the employer.	Charges are \$7 per day in extended care hospitals and in extended care units in short-term care hospitals. Children under the age of 18 are exempt. Low income individuals may benefit from total or partial exemption depending on their income.	Optometry, oral surgery in a university institution. Drug benefit. (Social assistance recipients and beneficiaries of the maximum old age pension and supplement). Functional aids for the visually handicapped under eighteen years. Dental services for children under fifteen.	1) \$532 million 2) \$1,451 million
New Brunswick Jan. 1, 1971 (Med. Care) July 1, 1959 (Hosp. Ins.)	No premium All eligible residents	In-patient: standard ward and all approved available services. Out-patient: all approved available services.	None	Prescription Drug Program for those 65 years and over and for those with cystic fibrosis.	1) \$39 million 2) \$145 million
Nova Scotia Apr. 1, 1969 (Med. Care) Jan. 1, 1959 (Hosp. Ins.)	No premium 8% health service tax	In-patient: standard ward and all available services. Out-patient: broad range of essential services as approved by regulation including: medically necessary laboratory, electroencephalographic and radiological examinations, radiotherapy for malignant and non-malignant conditions, electrocardiograms, physiotherapy facilities where available, various drugs, hospital services including meals for day patient care for diabetes, hemodialysis, ultrasonic diagnostic procedures and interpretations and electrocardiograms and interpretations, as well as various emergency diagnoses and treatment within 48 hrs. of an accident and various hospital services in connection with various minor medical and surgical procedures.	None	Optometric visual analysis; Dental plan for children born after January 1, 1967, or for students registered with The School for the Blind. Pharmacare plan for residents 65 years and over, diabetes incipitus drug program; cystic fibrosis program; Rare lip/cleft palate dental program. No charge.	1) \$65 million 2) \$174 million

Hospitals maintain a universal system of accounting. Budgeting for hospitals is done on a prospective basis, which is termed "global budgeting." A hospital receives a sum of money based upon a negotiated figure with a certain percentage increase each year. No additional public funds are added to the budget during the year. The hospital has full control over the allocation of the funds. If the hospital incurs a justifiable deficit, it may be awarded a supplementary grant by the Province at the end of the year. Profits may be retained, although, it might lead to a lower budget for the succeeding year. The hospital budget is reviewed by the provincial government which, in turn, sets the per diem rates for each hospital. Over the past few years, the hospital base figure has been shrinking until it is now below the current rate of inflation. Funds for construction of new and replacement health facilities, for training and research facilities come from the Health Resources Fund. These funds are not tied to the global budgets of hospitals. Among teaching hospitals, the available funds are divided among the applicants and systems of shared services are encouraged. In large teaching hospitals, all patients are potential teaching patients with very few exceptions. Major equipment replacement must be put into the global budget and often takes several years to accomplish. Some hospitals do have endowment funds available and sometimes these are used

for this purpose.

Purchases of major new equipment, such as CAT scanners, comes under the jurisdiction of the health planning authorities in each Province called District Health Councils. These councils which are somewhat like the Health Systems Agencies in the US were established to gain more control over the expenditure of health care dollars.

The strong emphasis on the hospital as the key to the health care delivery system from the beginning has had the effect of stifling the development of alternatives. As a result, for example, there are far too few nursing home or extended care beds to serve the population. Thus, patients remain in hospitals often far longer than necessary.

Physicians

Until recently, physicians generally have been pleased with the system of health insurance as it exists in Canada. They were instrumental in the early planning stages, and have become used to dealing with the government as the third-party payor. About 90% of all physicians nationwide practice within the health care system, being paid by the government for their services on a fee schedule basis. Fee schedules are negotiated in each Province by the Provincial medical society. Payment is approximately 80%-90% of the fee schedule, which is renegotiated annually in some

Provinces and less often in others.

Physician to population ratio in Canada is approximately 1:633.⁸ Just as in the US, an anticipated shortfall of physicians led to increased training, now, followed by a possible overproduction. A large number of Foreign Medical Graduates have immigrated to Canada over the past 30 years, many of them from the United Kingdom. There is now a movement to limit the number of foreign physicians coming into the country. Also, as in the US, the problem of distribution still remains. The major medical centers have the highest proportion of physicians, with the rural areas still under served. Incentive programs have been organized to attract physicians to these areas. Student physicians are being encouraged to enter family practice rather than other areas of specialization.

In most Provinces, specialty certification is through either the Royal College of Physicians and Surgeons or the College of Family Physicians. Physician discipline is maintained in different ways for each Province. In each hospital, there are mechanisms for peer review, such as tissue committees. In addition to the physicians' competency, his/her practice is continually reviewed by Provincial health insurance commissions. The physicians' statistical profile is maintained and his/her billing practices closely-scrutinized. Patients are sent periodic statements of fees paid on their behalf with comments requested as to the accuracy of the billing.

Initially, physician reimbursement under the Medical Care Act (Medicare) was thought by most to be equitable. Physicians were the negotiating body for the establishment of the fee schedule and had major input into the system. As fiscal pressures increased, the rate of increase in the fee schedule has slowed to well below the rate of inflation. Thus, physicians find themselves further and further behind in the payment scale. In 1971, average net earnings of physicians in Canada were \$39,200.⁹ This amounts to approximately 6.5 times the income of the average employee.

Other Health Professionals

Nurses in Canada are unionized in hospitals and have successfully negotiated favorable contracts over the recent past and have managed to raise their salary levels to a favorable position. Most nurses are graduates of two-or three-year training programs. Most nurses are diploma nurses with far fewer going into specialty training programs—either Baccalaureate degree or post-basic certificate programs; however, with rising costs, greater encouragement is now being given nurses to enter programs for Nurse Practitioners and Nurse Midwives.

The equivalents of Licensed Practical Nurses are called Certified Nursing Assistants in Canada. Educational requirements include completion of grades 9, 10 or 11, followed by a training program in hospitals or community colleges. These nurses perform fewer functions than do LPNs in the US.

Dentists are a major segment of the health service package. Dental care is included under the gov-

ernment program in many of the provinces. (See Table 2.) A program is currently underway to increase manpower in this area. In the past, some of the work of the dentist has been handled by specially-trained dental nurses. These nurses work often in the public schools and have provided dental services to a greatly-underserved population. Overall poor dental health of Canadians has given rise to some innovative projects which have somewhat alleviated the problem.

Other major allied health professionals in Canada include laboratory and X-ray technicians, rehabilitation therapists (a combination of occupational and physical therapy), pharmacists and chiropodists, of which there are extremely few.

Professional Liability

Canadian physicians pay approximately \$35 per year for membership in the Canadian Medical Protective Association. "Membership in the Association entitles a physician or surgeon to legal advice, legal representation in liability claims, and indemnification for damage awards that may be granted against him."¹⁰ Nuisance suits are not considered and expert witnesses are not paid fees except in very unusual circumstances. Physician members of the Association are expected to become defense witnesses. The Association provides the attorney to represent the physician, pays all damages and costs assessed against the physician as well as any appeals that are appropriate. In Canada, the claimant does not have the right to a jury trial. The trial is heard by a judge. The losing party in the suit pays the costs of the winning party, including reimbursement for attorneys' fees. Canadian attorneys are not permitted to represent a client on a contingent fee basis. Substantial awards for pain and suffering are rare.

Research

The funds for research activities in Canada are rapidly drying up. Some projects still exist through private grants. The very scarce resources available from the government must be shared between teaching and community hospital. Physician directors of research projects often engage in that activity without compensation, deriving their income from other sources—salaries as staff physicians mainly. Some physicians feel the quality of teaching in the medical schools will eventually take a step backward in time.

Ontario

The focus for the seminar was the province of Ontario, and it is appropriate to detail here some of the conditions in Ontario which may or may not exist in other provinces, but which mirror the general trends of Canada.

Two hospitals were visited and the vital statistics for each follow. The first, York County Hospital in Newmarket, is a suburban facility. It has been entirely-modernized and updated with new facilities added. The pathology laboratories have been constructed with an eye toward future expansion. The laboratory appeared to be operating at less than one-

third potential capacity. The laboratory is administered by an administrator who also is a trained laboratory technician. Under his charge are the staff technicians. He works in conjunction with the medical director of the laboratory and has full responsibility for the physical functioning of the facility.

This hospital has a very large in-patient psychiatric department. The psychiatrist in charge spent part of his time at the hospital and part-time in his private practice. He identified a shortage of psychiatrists in that area. A sizable portion of his time is spent in consultation with family physicians who refer patients for his evaluation and who then resume management of the patient if appropriate. (Full in-patient and out-patient psychiatric benefits are provided under the Ontario Health Insurance Plan—OHIP.)

There is currently a waiting period of about three weeks for elective surgery in this facility, and many perceive the time is growing longer. Part of the problem seems to be the lack of alternative care facilities into which patients might be moved. (See Table 3 for hospital statistics.)

The second hospital visited was Toronto General Hospital, a major inner-city teaching hospital. It is

not unlike many big city hospitals and was in the process of a major construction project. Two of the old sections of the hospital were to be torn down, while an extensive new addition was being constructed. The cardiac catheterization laboratory was located in a former greenhouse. The corridors were filled with equipment. The machinery, we were told, had been repaired and rebuilt by the hospital maintenance staff lacking funds for replacement equipment. With the new construction, this facility will be moved and new equipment purchased. Many of the staff physicians hold teaching positions with the hospital and are on salary. Teaching salaries have been declining in recent years. Nevertheless, most professionals on staff expressed satisfaction with the situation. (See Table 4 for hospital statistics.)

Ontario health premiums are the highest in Canada. The annual cost of the Ontario Health Insurance Plan (OHIP) is now \$528 per annum for a family of three. The rising cost of health insurance is reflected in other provinces as well. In its 1977-78 Annual Report, the Ministry of Health of Ontario shows a total revenue of \$914,016,052 and an excess of expenditure over revenue of \$2,766,092,949. The total revenue reflects contributions from the Government of Canada. The report is silent on the source of funds for the deficit. (See Table 5.)

Table 3: York County Hospital—Newmarket, Ontario

York County Hospital is a lay-public/general hospital established in 1922. The hospital serves the northern portion of the Regional Municipality of York. This catchment area covers some 700 square miles with an estimated population of 100,000.

Approximately 40% of the hospital admissions are from the towns of Newmarket and Aurora, 20% from the township of Georgina, and 20% from other areas of the Region; 15% come from the County of Simcoe and another 5% also come from outside the Region.

Table 4: Toronto General Hospital

Toronto General Hospital is a major teaching hospital located in the downtown core of Metropolitan Toronto. This lay-public/general hospital was established in 1820 to serve the needs of what was then York. The hospital has continued to expand to provide the ever increasing population of Toronto and surrounding areas with first class medical care and to provide a stimulating and research-oriented environment for its medical personnel.

(Source: Ontario Ministry of Health, Toronto, Ont. Canada)

Physicians in Ontario have become increasingly frustrated with the bargaining mechanism. The Ontario Medical Association is the bargaining agent for the physicians. They feel the exercise is merely one of determining what level the government will pay for the coming year. Increases have been approximately 4% per year, or below the inflation rate.

Prior to May 1, 1978, OHIP benefits were set at 90% of the OMA Schedule of fees. As of May 1st, however, OMA revised the fee schedule to indicate to physicians what appropriate fee levels would be in order to restore physicians' incomes to their position prior to the imposition of income controls. OHIP ruled the resulting suggested fees were too high to continue the 90% reimbursement ratio and established, for the first time, its own schedule of benefits.

Table 6 is a Comparison of Fee Schedules for Selected Procedures compiled by the AMA. The Table lists both the OMA suggested fee and the Ontario Health Insurance Plan fee as compared with Medicare payments for Cook County, IL.

Indications for the Future

Of the 24 speakers who addressed the seminar, only a very few expressed total dissatisfaction with the system. One indicated plans to leave the country. Most agreed they felt the Canadian system is the best that can be found anywhere in the world today. All, however, expressed a growing degree of frustration with the system as it now must respond to severe economic pressures unknown a decade ago.

Canada, like the US, is feeling the effects of increasing inflation and shrinking dollar values. The crunch has been long in coming to Canada; thus the weaknesses in the system have taken much longer to identify. In the years 1960-78, health care costs have risen from 5.5% of the GNP to 7%. At the same time in the US, the percentage has gone from 5.2% to 9%.

Governments both Federal and Provincial are beginning to wrestle with the problems they face within a system which provides everything to everybody. The notion that unlimited health care freely available is a basic human right seems to have been an underlying factor in the establishment of the Canadian health system. While an attractive idea in principle, the philosophy carries with it no individual responsibility. Thus, society as a whole assumes the responsibility for the health care of each individual, including those who freely abuse their health. This fact has led to a new government concentration on healthier lifestyles for individuals. In a treatise entitled *A New Perspective on the Health of Canadians: A Working Document*, Marc Lalonde, Minister of National Health and Welfare of Canada observes "The ultimate philosophical issue raised . . . is whether, and to what extent, government can get into the business of modifying human behavior, even if it does to improve health."¹¹ The document attempts to answer the question raised.

The Minister has prepared a very elaborate plan for altering the lifestyle of Canadians aimed at all sections of the society. He proposes to enlist the aid of

the major segments—health professions, scientific community, educational system, business sector and trade unions and others. Working together, it is anticipated they will be able to control health risks and force the individual to accept responsibility for his/her health.

Whether they embrace the principle of behavior modification or not, Canadians must now deal with several major problems which were not clearly apparent when the system was implemented.

- * There are no longer sufficient funds to provide *all* services on an unlimited basis to *all* citizens.
- * New research has been steadily dropping for a lack of funds and is presently at a dangerously-low ebb.
- * The hospital-centered delivery system is too expensive to maintain when no viable alternatives are offered.
- * Hospitals still have very little incentive to operate at peak efficiency, even with the global budgeting system.
- * Physician morale is dropping steadily. It is too early to predict whether this will lead to concrete action such as strike or emigration.
- * There is no economic pressure on the citizen to use the system responsibly.

Lloyd Detwiller, Administrator of the Health Sciences Centre of the University of British Columbia and a leading expert on the Canadian system, observed at the conference, "Our systems have no incentives to encourage the public to use them reasonably. On the contrary, there has been encouragement in the past for people to enter the system for any sniffle, ache or pain that they might have. We are attempting to change this by voluntary persuasion, but the volume of questionable demand continues. Even the producers of health services find it to their advantage not to operate too efficiently and effectively, for there seems to be

a political way of having their deficits and over-development picked up by the prepayment authority. Our health systems have no brakes. People demand care and governments seem to have no option but to pay."¹²

A rather cynical summation of the dilemma and current attempts to solve it are presented in Table 7.

Table 7: "The Nine Dogmas of the National Health Service Religion"

1. The unchecked rise in the cost of medical services is the greatest and most urgent problem of the Occidental societies.
2. Physicians are responsible for this situation: They create the demand for there is no true market in medical services, the consumer having no knowledge of the quality of the product.
3. The medical profession pushes needless medical consumption for its own benefit out of greed and furthermore is given a blank check.
4. Physicians are associated in this conspiracy with the medical-industrial complex.
5. Nationalization of the health industry, including physicians as civil servants, is the only way to rationalize medicine.
6. The first and most important move should be for the state to hire ALL doctors on a salary basis: This would automatically reduce costs drastically.
7. MDs should be reduced in number and replaced by clinical nurses, medics, optometrists, chiropractitioners, podiatrists, acupuncturists, et al. The services of these professionals would surely be adequate and eventually less costly.
8. People should be instructed to solve most of their medical problems themselves.
9. Curative medicine should be curtailed in order to foster the development of preventive medicine.

(The above supplied by Dr. R. Robillard at the 2nd Conference on the Canadian Health Care System, Toronto, November, 1978).

These remarks are those of Raymond Robillard, MD, Past President of the Association of Medical Specialists for the Province of Quebec. Dr. Robillard was instrumental in establishing a physicians' union in Quebec. By June, 1979, all physicians in Quebec will have become salaried. Robillard blames part of the current problems of physicians on their shortsightedness in perceiving the ultimate outcome of a National Health scheme and in their reluctance to become fully-involved with its initial creation and then with its ongoing development.

As in all problems of great complexity such as that facing the Canadian Health System, and those we face in the US, there are no simple solutions. One can, however, learn from the mistakes of others.

Detwiller, again, has some relevant observations. "The greatest challenge of all is to abate consumer demand . . ."12 No matter what controls are imposed by the government, there will never be sufficient resources to fill the need created by a totally prepaid system. He suggests a few key ideas worth careful consideration:

- * Citizen-patient participation in the form of deterrent fees, coinsurance charges or percentage sharing. Without them, we have shown we are unable to discipline ourselves so as to use the system reasonably. Total first dollar coverage must be withdrawn.
- * Need to change public attitude toward care of the body. Proper diet, exercise and health teachings should be given priority in educational programs.
- * Development of a private system of health insurance and care, alongside the government ones. These should not operate at the expense of the government program, but should assume a fair share of problem cases and special risks. Such a system would provide a choice to the public and could remove much of the pressure on governments to meet the continued expanding demand for more and more health services.¹³

•

Physicians attending the conference were given some admonishments to carry away with them. The promise of guaranteed money and convenience of a prepaid government system are seductive. The physician becomes part of the system and loses any ability to alter it. The dynamic interaction in medicine is between the patient and the physician, from treatment through payment. It should be maintained; and, the physicians must be unified. A concerted effort to make and keep the system responsive is essential. For this, physicians must work together. It was acknowledged that Canadian physicians did *not* make such a unified effort and are now feeling the consequences. Canada has provided the US with an excellent example of both excellence and failure. It is an invaluable resource to use in the consideration of any government-sponsored health insurance program, but to adopt its provisions, without modification to address the particular problems faced here, would solve nothing.

Information for Authors

MED-CHI MEMBERS reading papers before Faculty or other organizations are invited to submit their papers to the **JOURNAL** for consideration by the Editorial Board for publication.

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published and are contributed solely to the *Maryland State Medical Journal*. An abstract or summary, limited to 200 words, should be included.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the *Journal* and are not returned. The *Journal* is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to Editor, *Maryland State Medical Journal*, 1211 Cathedral St, Baltimore MD 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, double spaced throughout (including text, case reports, legends, tables and references) with margins of at least one inch. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations and any institutional or other credits. Please include a complete address where the author may receive proofs for approval and corrections.

The author should retain another copy of the manuscript for his/her records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title and its position in the text should be indicated. The Editor reserves the right to edit the tables. Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text. A complete review of the literature is rarely desirable. References must be typed double spaced and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article and date. Complete dates (month, day and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition,

location, publisher year, volume (if given) and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book) and the title of the chapter, if any. References should be listed consecutively, both in text and listing.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black and white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Please do not deface an illustration by writing on the front or back **UNLESS** it is done lightly with a grease pencil or so lightly that the imprint will not register through to the front. The figure number and author's name will suffice.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings. The Editor reserves the right to limit the number of photographs used.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with *Journal* style.

A set of galley proofs will be provided the principal author and, if not returned by the specified date, will be considered approved as type-set.

Statements made or opinions expressed by any contributor in any article or feature published in the *Journal* are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the *Maryland State Medical Journal*, is protected by copyright and may not be reproduced without the written permission of both the author and the *Journal*. ☐

Studying the History of the Development of Professional Ethics in American Medicine

By JOSEPH I. BERMAN, MD, MPH

Dr. Berman is Chief of the Department of Community Medicine of Sinai Hospital of Baltimore, Inc., Balto., MD 21215, where he can be contacted for reprint and other data.

Synopsis

A Fellowship from the National Endowment for the Humanities permitted the author to spend a month intensively studying the history of the development of professional ethics in medicine, together with eight other physicians and two non-physicians. The course presented an opportunity to develop an understanding of the historical facts and precedents leading to our present position on ethical issues. This knowledge can be useful to a physician in helping him/her to better understand the genesis of his/her own ethical ideas, as well as those of his/her profession. Physicians must be prepared to respond to the demands and pressures of a society that is greatly concerned with major ethical dilemmas of the day. Organized, concentrated study of professional ethics will better provide physicians, who may otherwise be unprepared by previous training, to participate in such discussions and to affect their outcome.

The busy physician, striving to maintain clinical excellence in his/her practice is offered a bewildering array of educational opportunities. University medical centers, specialty organizations and travel groups, often combining learning with "fun in the sun," entice the practitioner to sharpen clinical skills. These offerings may not be ignored because of the very real need to maintain these clinical skills and because many states now require a prescribed number of hours of Continuing Medical Education for relicensure. CME appears to be one of the great growth industries in American business today.

The physician must decide on the nature of the subject matter he/she wishes to pursue, and the amount of time that he/she can afford to spend. I am unaware of any formal study of physicians' choices of continuing education subjects, or the relationships of the choice of subject material to the physician's clinical specialty; however, one might intuitively believe that study of the history of medical ethics in American medicine might not be expected to be of major interest to most physicians trying to maintain professional skills and meet licensure requirements. A history of medical ethics, if considered to be of any importance at all, might well be relegated to historians and philosophers.

During this past year, I had the experience of participating in a one-month seminar devoted to the subject of the history of medical ethics in American medicine. The seminar was formally entitled *The Quest for Professional Ethics in American Medicine: An Historical Exploration*. For 20 full working days and many more nights I—together with eight other physicians of diverse

backgrounds and ages, a minister and a nurse—pursued this historical study under the direction of the faculty of the Institute for the Medical Humanities at the University of Texas Medical Branch in Galveston, TX. The experience, as well as the subject matter, was so interesting that I feel that a brief communication about the course would be appropriate. Despite the need for technical skill and excellence, there are other aspects of the medical profession which might well be studied with value to the individual physician as well as the community at large.

The National Endowment for the Humanities

The National Endowment for the Humanities is an independent Federal grant-making agency created by Congress in 1965 to support projects of research, education and public activity in the humanities. The humanities are defined very widely in the Act, which established the endowment and include, among other things, subjects concerned with questions of value. Among the many activities of this Federal agency are fellowships and stipends for the professions. The purpose of this latter program is to "Give persons in professions outside teaching an opportunity to stand back from their work and to study the historical, philosophical, social and cultural dimensions of their professional interests."

The Galveston seminar was one of some 27 that were available to professionals from business, law, education and the healing arts. Some dealt with subjects of particular interest to a particular profession and membership was generally restricted to members of that profession. Others were interdisciplinary. Because of the wide disparity in subjects, as well as the fact that each course was given at a different university and by different faculty, no generalizations can be made. My comments refer only to the specific course given in Galveston.

After formal application to the National Endowment for the Humanities, I was awarded a stipend for living expenses to study the history of ethics in American medicine at Galveston.

The Study of the History of Medical Ethics

The course required an almost total immersion in the history of medicine and the development of ethical precepts in medicine. Six hours of classes per day involving lectures and discussion were followed by four-six hours of reading nightly.

Curiously, at a time of ringing ethical debates of physician responsibility in such problems as abortion, the right to die and genetic screening, one finds a great

paucity of work written about the development of ethics in American medicine. No definitive text exists on the subject; therefore, a wide variety of sources were utilized during the course, ranging from the Hippocratic oath to readings of contemporary philosophy. Medical history itself does not stand alone, of course, but relates closely to general history. There was need then for extensive reading in both world history and then more specifically in American history. The characteristics and origins of the American medical profession, inextricably interwoven with the particular social relations of the American colonies and their historical antecedents were explored.

Gradually, an understanding of the major ethical precepts of virtue, duty and justice as they evolved over a period of some 2,000 years developed. The physician as a Christian and as a gentleman, the physician with the need to know disease (a concept arising originally with Galen), the physician with duties and responsibilities for the state of the public's health (the 18th Century concept of Medical Police), the physician's responsibility to see that all should share in the benefits of health care, were carefully traced and developed to the present time.

Of particular interest in the development of American medical ethics was the use of ethical codes beginning with the work of Percival in 1803. The American Medical Association, with its first code of ethics in 1847, attempted to lay out rules of etiquette or proper behavior between physicians, their patients and the general public, at the same time as they attempted to encompass major ethical precepts of the time. Study of the various revisions of the AMA codes in the latter half of the 19th Century and on into the 20th, demonstrated some of the changes in the thinking of the organized profession and in part reflected the necessities and vicissitudes of the times in which they were being written.

The AMA code is now being revised yet again. I find it interesting to review the present code and its latest revisions and to consider the code's usefulness as a document to guide the physician in meeting his/her ethical obligations. A physician who is aware of the origin of these ethical precepts is in a much stronger position to judge their value.

There was ample time for the seminar participants, during their reading and discussion, to think about the basis of their own concepts of ethical behavior and to test these concepts against the ideas of others with similar concerns. We tried to determine the origin of our own ethical beliefs, examining the influences of major factors such as religion, law and personal experience.

At least one major historical lesson became clear to me. The development of concepts of ethical behavior among physicians is a continuing process with long-standing historical origins. Ethical ideas that are taken for granted today, i.e., that the physician ought to care for the mentally-or terminally-ill, or even that the physician ought to be responsible for advising the patient of terminal illness, are of relatively recent vin-

tage and have altered the physician's role and the relationship with patients and the public. The explosion of scientific knowledge which has occurred in the last 125 years has given heavy weight to the ethical precept of the physician as one who must know and understand the science of medicine, but the need to know may have overwhelmed many other major ethical obligations of the profession. Understanding the major changes that have occurred in the past sensitizes one to inevitable and continuing changes in ethical responsibility.

The teaching of medical ethics, as well as the humanities, is for the most part ignored in American medical schools and, indeed, was *not* taught to me during my medical school days. The failure to teach these subjects and the preoccupation of the physician in training and in practice with the need to know facts ill prepares the modern American physician to deal with major questions of ethical duty that are now being asked. The value of the Galveston course lies in its reviewing the development of the basic tenets of the "good physician" and provides understanding of the ethical responsibilities of the medical profession and how these responsibilities fit into the larger scheme of things.

I cannot know now what the long-term benefits of a concentrated course of study like the one offered in Galveston will be on me and my seminar associates. I do feel, however, better equipped to deal with both physicians and non-physician philosophers, social scientists, lawyers and others who are now involved in the further development of professional ethics in American medicine. Those with concerns about the historical development of medicine and its ethical responsibilities might wish to entertain the possibility of laying aside their stethoscopes and scalpels for a short period of time to consider these issues. □

MARYLAND TIES AGAIN AVAILABLE!!!

Fine quality, in colors of burgundy, blue and black (traditional), at \$8.50 each; 40@ deductible. Proceeds will be divided between the University of Maryland and John Hopkins Medical Schools.

Interested? Write or call Mrs. Elmer G. Linhardt (State Chairman, AMA ERF), 3 Chesapeake Ave., Annapolis, MD 21403; (301) 263-2156.

Medical Miscellany:

Gasoline Sniffing Brings Lead Poisoning Hazard

Gasoline sniffers run a risk of serious illness from lead poisoning. Three cases of lead poisoning among individuals who sought a "high" from sniffing gasoline fumes are reported in the Sept. 22nd *Journal of the American Medical Association JAMA*.

Dr. Richard O. Robinson of the University of Kentucky Medical Center in Lexington, reports two cases of organic lead poisoning due to habitual gasoline sniffing. A 14-year-old boy died and a 15-year-old girl recovered from serious illness.

Drs. Knight S. Hansen and Frank R. Sharp of the University of California in San Francisco, report the case of a 27-year-old man who was seriously-ill from lead in the fumes of inhaled gasoline. Say Drs. Hansen and Sharp: "Considering the universal availability of leaded gasoline, its low cost, the relatively-small amount of vapor required to produce intoxication and our drug-oriented society, it is surprising that so few cases of gasoline sniffing with resultant lead poisoning have been reported." □

This Year 300 Physicians Will Start A Practice They Thought Couldn't Exist.

We supply the office, the staff, the patients, and the best equipment to work with. Free professional liability protection, \$32,000 a year to start, or more depending on experience. Even 30 days paid vacation. Be the doctor you want to be in today's Navy. For a free brochure explaining all details, call Mr. Curtiss at 800-492-0326. Or write:

Comments on Teaching Medical Ethics

By PHILIP FRANKLIN WAGLEY, MD

For reprint and other data, contact Dr. Wagley at 9 E. Chase St., Balto., MD 21202.

Why teach medical ethics? There are various ways one could answer this. The all-encompassing reason is that there are more problems in health care today than there were years ago. More diagnostic techniques are available as are more therapeutic means. Such developments require trained technicians and even teams. Patients and third-party payors, including government, expect more. Physicians' roles have changed. Many have become the technicians and team members. Frequently, while knowing a great deal about the disease-label that patients carry, they know practically nothing about the patients as persons—worried, even frightened human—beings concerned over their disease-label also and what impact their illness will have on their lives and loved ones. Naturally, this may lead to a strong desire for some role in the decision-making by a patient. That wish for autonomy requires explanations of why a procedure is indicated, a certain medicine given or a period of hospitalization needed. Increased expectations by patients and their simultaneous desire for autonomy have developed during a period of growing skepticism about the idealism and dedication of members of the medical profession.

Consequently, the criteria of behavior of physicians with patients and families as well as with consultants and other medical associates all need closer and more critical scrutiny.

Obviously, it is possible to practice medicine today without having had a formal course in medical ethics, but that doesn't mean one is practicing the best medicine. In the near future, without such training, it will probably mean one is not practicing even good medicine.

The best definition of ethics is that quoted by Bok¹ from the writings of Epicurus: "Ethics deals with things to be sought and things to be avoided, with ways of life and with the telos." (Telos means the chief good, the aim or the end of life.)¹ Thus, medical ethics deals with what is to be sought and what is to be avoided in personal relationships in a medical setting. Is it practical to create a code of rules and regulations? To be explicitly effective, such would have to cover every possible exigency or problem. Would utilitarianism or some type of formalism be the foundation? Creating such a code not only seems impractical with what is known today, but less so with what unknown features may become important tomorrow. This does not mean, however, that general guidelines with broad implications should not be sought and cannot be found having practical effects now and in the future. Each clinical problem is, in a sense, unique but awareness by a physician that one never treats simply a disease, but instead a patient with a disease sensitizes the doctor to the unusual features and their modifying effects

on the planned outline of therapy.

Can one, however, teach ethical guidelines in a meaningful manner? Does such rote modify behavior? In clinical teaching, didactic lectures are supplemented with "bedside" instruction. This allows students to watch the interaction of patient and physician. It is a clinical demonstration. They can witness how the number one member of the entire group, the patient, is questioned and examined by a senior member of the staff. The demonstration of courteous thoughtfulness while applying expertise is more indelible than impersonal didactic recitation.

Unfortunately, time restriction limits such a mode of pedagogy. Perhaps no patient will ask the physician in front of students, "Am I going to be able to resume my work?" or "Do I have cancer?" or "Am I going to die?" The medical-ethical responses to these situations have to be given a lecture-seminar form. One might ask why use "ethical" in considering these questions? The answers to all three questions require value judgment. Physicians and patients may view problems with different attitudes. Physicians responses may range from the evasive to the callous or to the overprotective and paternalistic. Even if patients know what is considered the "best" treatment, they may not choose such for personal and emotional reasons.

How early in the medical curriculum should students be made aware of the multifaceted patient-physician relationship? The answer is before the students' interests can be diverted by some physical or historical diagnostic feature; while their limitation of knowledge, so to speak, forces them to see the patient as a whole. If given the privilege and opportunity of watching a good physician relate to a patient in a clinical setting, one of two types of emphasis can be made: 1) Some interesting diagnostic or therapeutic features stressed or 2) an overall, panoramic view of the patient's problems constructed. In the second approach, the student could be distracted by concentrating on physical signs or laboratory data. Thus, the case evaluation can be accomplished effectively before the student has had clinical training. Both the patient and the physician should be objects of teaching-interest as the latter tries to help the former. Student observations naturally lead to questions such as "what?" is the physician trying to do; "why?" was a certain question asked; "how?" did the physician appear to cope with an unexpected problem related to the patient's future plans, activities, security, etc. It is in the broad spectrum, the total clinical picture, the panorama that the ethical relationships can be found and evaluated. Consequently, medical ethics should be taught early in a medical curriculum; for example, taught before interest in signs of chronic obstructive pulmonary disease obscure the fine points of the multifaceted, supportive, clinical role the physician can have for a respiratory cripple and family.

Bedside teaching in recent years occupies a smaller percentage of medical school curriculum. By the time a student reaches that stage, there is a great desire to see the eye signs of thyrotoxicosis, feel an enlarged spleen or hear a heart murmur. The patient possessing such is valued in proportion to the rarity of the tragic stigma. How coarsening and hardening is that to the physician of the future? Appreciably, judging by the attitude of many medical scientists, teachers and practitioners today and what that attitude has elicited among the public and current so-called "ethicists."^{2,3}

As mentioned, there is an inherent distraction from the ethical issues at the bedside. The immediacy of a clinical problem and technical solution can overshadow the later developments. This has created an atmosphere in some intensive and coronary care units that is dehumanising. While a patient with a tracheal tube has a Swan-Gans catheter placed, various recordings and their significance are discussed across the bed with such remarks as "try" this or that. Exclamations of frustration, failure or success follow with no more consideration than if the patient were an insensate mannequin. As an afterthought, if the patient has submitted passively, a word of encouragement may be voiced. Later, an expression of success is in terms of what the "team" has done, and not what the future holds for the subject.

What can a medical curriculum offer to alter this "supertechician" attitude? There are two steps to be taken. First is to emphasize early in medical training ethical aspects of the very personal patient-physician relationship by carefully-chosen topics and examples in lectures and discussions. Secondly is to give students the privilege of watching wisely-selected senior physicians relate to patients in such settings as their private offices and accompany them to convalescent homes and on hospital rounds. The selection of the preceptor is of utmost importance. Clinical competence alone is not enough. The ethical behavior considered in all of this denotes "caring." Medicines can take care of the disease, but the physician takes care of the patient. It is the latter relationship that a student must witness. The preceptor should serve as a model-image. In so doing, demonstration of a physical sign is not as important as discussing what one does to help the patient with its cause and effect. Some respected members of medical academia and some practitioners cannot qualify for this role. To fulfill it well requires years of personal clinical experience. By "personal" clinical experience, one automatically eliminates those medical demonstrations carried out "through" an associate or postgraduate fellow. Here, a third party has come between the patient and senior physician—reciting history and physical findings as an intermediary. In an academic setting, the so-called "part-time" physician who traditionally works alone with each patient can become a uniquely useful and integral part of teaching. Such an opportunity and privilege to contribute gives this type of preceptor a role of pedagogical importance. What is said and done by the physician and patient are of equal importance to the student. After leaving the presence of the patient, students should be encour-

aged to ask questions as to "why" certain questions were asked and answered as they were. The implications of variations of the answers can be discussed meaningfully; however, to move too far from the patient's actual problems and solutions may lead into a realm of speculation where discussion becomes relatively impractical and unrewarding.

The need described here is the teaching of superior qualities of the patient-physician relationship; the demonstration of thoughtful respect and consideration, requisites of caring. All medical research, prior training, diagnostic studies, therapy and the planning for the future pivot about the Number One person—a human being, requiring assistance, support, guidance and care—the patient.

L. H. MILES, Managing Editor
Maryland State Medical Journal
1971-74

Nutrition in Maryland, 1899-1928¹

By SAMUEL MORRISON, MD, 1905-

Editor's Note: Dr. Morrison is engaged in the practice of Gastroenterology and Internal Medicine and has offices at 11 East Chase Street, Baltimore. Born in 1905, he received his MD from Johns Hopkins University School of Medicine in 1929.

He is Assistant Professor of Gastroenterology at the University of Maryland School of Medicine and on the staff of several Baltimore hospitals. His memberships include the American Gastroenterological Association and the American College of Physicians.

Great names appear in the nineteenth century as well as in the modern history of nutrition until E. V. McCollum came to Baltimore, the contributions of Marylanders to the field of nutrition were sporadic and only of temporary importance. The Maryland period from 1899 to 1917 stands in marked contrast to the years following 1917. In the former period there were noteworthy contributions. Books were written, and clinical and scientific nutritional articles as well, but there were no fundamental discoveries so characteristic of McCollum and his collaborators.

Elmer Vernon McCollum became Professor of Biochemistry in the School of Hygiene and Public Health of the Johns Hopkins University in 1917. It is interesting that the School was not formally opened until October, 1918, at the old site of the University on North Howard Street and not until the autumn of 1925 was the new building, occupied. Associated with this institution a major part of McCollum's work was done on deficiency diseases, faulty diets and nutrition of animals with isolated and purified food substances. This work, covers the formative and developmental periods of the School of Hygiene and of the Johns Hopkins University.

Perhaps a review of McCollum's book *The Newer Knowledge of Nutrition* will convey to the reader the extent of his work as well as the work of other Marylanders in the period 1899-1925.

The book has gone through four editions, the first in 1918 and the last in 1929. Nina Simmonds, who collaborated with McCollum in so much of his research, became a co-author in the later editions. This book, to a considerable extent, records, summarizes, and interprets experiments that mark the progress of our knowledge of Nutrition.

Before 1900, the idea that there was any marked variation in the quality of proteins from different

sources was not generally appreciated. "It is remarkable," McCollum and Simmonds note, "that students of Nutrition accepted for so long without experimental proof the belief that a chemical analysis revealed the dietary values of foods even though for centuries in several parts of the world restricted diets have produced diseases in man."

McCollum (after 1911) collaborated in some fundamental work which was originally begun in 1906 at the Wisconsin Experimental Station. The object of this experiment was to determine whether rations for cattle so made up as to be alike insofar as could be determined by chemical analysis, but derived each from a single plant, would be of equal nutritive value for growth and maintenance of vigor.

One of the earliest explanations occurring to investigators as to the possible cause for the failure of animals was the probable need for phosphorus in certain organic combinations. A number of experimenters studied, between 1898 and 1909, the relative merits of organic and inorganic forms of phosphorus in Nutrition. McCollum reviewed these studies (1909). In 1907, McCollum took up the study of the cause of the failure of animals to grow on mixtures of purified foodstuffs and employed the rat as the experimental animal. He (1909) introduced a new feature into experiments of this type by seeking to increase the variety of foodstuffs in the diet. This work is deserving of special notice because it reported the first experiments involving growth with a food supply considered to be essentially a mixture of purified foodstuffs, every one of which could be named. Since this diet was something more than it appeared to be, the results were not clearly understood until several years later.

There was no appreciation of the peculiar worth of certain foods as supplements to others until after the year 1900. Nor was there any appreciation of the difference in quality of foods such as we now fully recognize. The astonishing fact that certain lists of common foods do not maintain satisfactory nutrition, even though they have collectively a chemical composition similar to those of another list which is satisfactory for the promotion of nutritive well being, did not become appreciated until about 1915.

In *Nutrition* the studies of McCollum and Simmonds introduced the idea the word "normal" is too indefinite a term. It is less satisfactory than "optimum" to designate the standard of excellence toward which we should strive. They emphasized that our standards of what constitutes normality are based upon common ob-

servation rather than the best possible achievement as illustrated by the best specimens in the population.

In 1913 McCollum and Davis demonstrated the peculiar value of butterfat and egg-yolk fats as contrasted with lard and olive oil. This work led them to the discovery of the special growth-promoting properties of butterfat as contrasted with vegetable fats and certain animal fats.

Between 1913 and 1918, McCollum and his co-workers turned their attention to the study of the deficiencies of our natural foods from the dietary standpoint. It was through the latter studies that the next advance was made in our knowledge of what constitutes a satisfactory diet. Later work by McCollum and Simmonds (1917-1921) demonstrated that the deficiency in mineral elements in wheat and other seeds is limited to the four elements; viz, calcium, phosphorus, sodium, and chlorine.

When a diet consisting of polished rice supplemented with the protein, casein, butterfat, and a properly constituted salt mixture failed to induce growth, McCollum and Davis (1915) found by further experiments that a second dietary essential, of which an animal needs but a very small amount, but which is necessary for growth in the young and for maintenance of health in the adult, could be postulated. This second dietary essential is now known as Vitamin B. As a result of their studies, McCollum and Davis formulated (1915) their working hypothesis of what constitutes an adequate diet. This hypothesis contained all that could be said about the needs of the rat for dietary essentials hitherto unappreciated at this time (1915).

When it was apparent that there were two unidentified dietary factors in the nutrition of the rat, one soluble in fats, the other never associated with fats but easily dissolved out of natural foods by water or dilute alcohol, it became necessary to differentiate between them by names which would characterize them. None of the terms in use seemed desirable, so McCollum and Kennedy (1916) suggested the provisional use of algebraic terms, using a prefix designating characteristic solubility. They proposed the term fat-soluble A and water-soluble B, respectively, to designate them; these terms found widespread acceptance.

The numerous experimental data from the work of McCollum and Simmonds all point to the conclusion that when the life history of the individual is considered, a generous protein ingestion or one allowing a fair margin of safety over the lowest percentage which just suffices to induce maximal growth in the young serves to maintain vigor for the longest possible period.

McCollum, Simmonds, and Pitz (1916) found wheat germ to be exceptionally valuable in several respects and they were the first (1916-1917) to point out the contrast between the state of Nutrition which can be secured with suitable mixtures of leaf and seed, as compared with complex mixtures of seeds.

One of the greatest surprises in the history of nutritional research was the discovery by McCollum, Simmonds, and Pitz of the unique dietary properties of the leaf as compared with those of the other parts of

the plant, especially in the diets of peoples who are largely vegetarian.

McCollum, Simmonds, and Pitz (1916) demonstrated the inability of little rats to grow when nursed by mothers whose diets were deficient either in A or B or both vitamins. They demonstrated that the lactating female cannot put the vitamins into her milk unless they are furnished by her food.

McCollum and Simmonds had repeatedly observed the development of that peculiar form of ophthalmia in animals subjected to faulty diets. They collected numerous observations, all of which pointed to the belief that the eye disease in question was noninfectious and that it could more satisfactorily be explained on the basis of specific starvation for vitamin A than on any other. They (1917) correlated these observations on rats with those reported by Bloch and by Mori and concluded that the xerophthalmia or keratomalacia produced experimentally in animals is the analogue of the condition reported in man. On this evidence they formulated the view that this type of xerophthalmia is a manifestation of a deficiency disease due specifically to lack of vitamin A.

McCollum and Davis (1915) in their study of the wheat kernel first called attention to the fact that the germ was rich in the substance curative for polyneuritis. They suggested that it was the loss of the germ rather than of the cortical layer which deprived rice of its protective power in beriberi.

Voegtlin and Myers (1919) called attention to the fact that vitamin B reacted to chemical reagents such as methyl alcohol, silver, lead, and barium salts in a similar way to secretin. Souza and McCollum (1920) attempted to use yeast cell multiplication as a test for vitamin B and showed that no confidence could be placed in it, since yeast grows slowly in a vitamin-free medium.

Shipley, McCollum, and Simmonds (1921) found the bones of rats in polyneuritis brought on by a diet adequate except for lack of vitamin B and G to be quite indistinguishable from those of guinea pigs dying of scurvy.

Parsons (1920) produced acute scurvy in guinea pigs. She then fed the fresh livers of rats reared on a diet free from vitamin C to the scorbutic guinea pigs and observed prompt cure. The rats were able to synthesize vitamin C.

Parsons in collaboration with McCollum (1920), Hutton (1924), and Reynolds (1924) extended these studies on vitamin C. McCollum and Pitz did not at first accept the view that scurvy is a deficiency disease.

In 1917, while carrying out a series of experiments designed to discover the nature of the dietary deficiencies of two or more cereal grains, McCollum and Simmonds observed that many of their rats developed beaded ribs and showed collapsed thoraces. A systematic effort was made during the next two years to find what kinds of inorganic salt additions would supplement these cereal diets in order to prevent the abnormalities of the skeleton. It was found that no matter

what salts were added, a normal skeleton was not produced unless a calcium salt was included in the diet. It was recognized that, although these abnormalities suggested rickets, a diagnosis of rickets could not be made from gross bone lesions, but a histo-pathological study was necessary.

In 1919, the late Dr. John Howland was shown some of these animals. He believed some of these bone conditions were rickets. This interview resulted in a co-operative investigation between the Department of Pediatrics and the Department of Chemical Hygiene, Doctor E. A. Park and Doctor P. G. Shipley representing the former, and the authors (McCollum and Simmonds) the latter.

Park and Howland (1921) proved by means of the X-ray that the administration of cod liver oil to rachitic children was followed by the deposition of lime salts in the cartilage and bones after a period of 15 to 21 days. Shipley and co-workers (1921) pointed out that when cod liver oil was administered to animals with rickets a line of calcium phosphate was laid down in the matrix of the proliferative zone. They also pointed out (1921) that the changes produced by sunlight in the skeleton of rats with experimental rickets did not differ in any important respect from the changes produced when animals are kept in room light but on a diet supplemented by cod liver oil. Years later (1926) Macht and Stepp studied the effect of polarized light on experimental avitaminosis.

Shipley and co-workers (1921) reported the production of rickets by means of two diets. This observation of Shipley and co-workers, as well as that of Sherman and Pappenheimer, marked a distinct advance in the investigation of rickets. They showed the importance of the inorganic constituents of the diet, especially of phosphorus in relation to the disease.

McCollum and co-workers (1921) studied the effect on growing rats of diets deficient in calcium. Shipley and co-workers (1921) stated, "whatever the defects in the salt composition in the diets, employed, the effect of the addition of cod liver oil was greatly to improve the growth and condition of the animal as a whole, and to shift the pathological condition in the bones toward the normal condition." Park, Guy, and Powers (1923) and Park (1924) extended the studies on the effect of cod liver oil in animals fed varying ratios of calcium and phosphorus.

Shipley and co-workers (1921) reported the production of rickets by means of a diet relatively high in calcium, and very low in vitamin A and phosphorus. The calcium was high only in the sense that it was excessive in proportion to the phosphorus content, which was extremely low. These and other experiments (1922) led them to an appreciation of the significance of the quantitative relationships between calcium and phosphorus in the diet. They were led to believe that there are two kinds of rickets: one is characterized by a normal or nearly normal blood calcium and a low blood phosphorus (low-phosphorus rickets; calcium:phosphorus ratio large); the other, by a normal or nearly normal blood phosphorus but a low blood calcium (low-calcium rickets; low calcium:phosphorus

ratio). The investigations of Howland and Kramer (1921) and of Kramer, Tisdall, and Howland (1921) on the calcium and phosphorus content of the blood serum in rickets and tetany supported this view.

Shipley and co-workers (1921) discussed the relative effectiveness of cod liver oil and butterfat for protecting the rat against an insufficiency of calcium in the presence of what under normal conditions is about a normal phosphorus supply. They were not willing at that time to make the statement that a separate factor distinct from vitamin A was to be found in cod liver oil. They stated: "We have not found it possible to demonstrate experimentally a difference between the effects of cod liver oil and butterfat when the content of the diet in calcium and phosphorus is near the optimum, the other elements in the diet being satisfactory." They further stated: "These results suggest the possibility that a dietary essential distinct from the anti-ophthalmia substance (vitamin A) may exist. If this is the case, this would appear to be present in butterfat in small amounts but to be very abundant in cod liver oil." In 1922, McCollum and co-workers presented evidence which was all but conclusive that there is in cod liver oil and butterfat a calcium depositing substance distinct from vitamin A.

McCollum and co-workers demonstrated that Diet 3143 always produces a florid rickets and that these animals can be used to determine the presence or absence of vitamin D in foodstuffs. In 1922 they demonstrated that animals in this condition will produce a positive "line test" if allowed to starve. Howland and Kramer (1922) showed this calcification to be accompanied by changes in the calcium and phosphorus in the serum. Park, in 1923, gave his reasons for regarding the rickets produced in rats to be identical with that seen in human beings.

Shipley (1924) made the fundamental observation that a bone from a rachitic rat begins to calcify within 48 hours when placed in the serum and plasma of a normal rat or of a rachitic rat during the healing process. Shipley, Kramer, and Howland (1926) carried these studies further.

Howland and Marriott (1918) discussed the theories concerning the etiology of infantile tetany. They stated that the evidence in 1918 failed to support most of the theories, although there had been in the literature for 100 years satisfactory descriptions of infantile tetany. Kramer, Casparis, and Howland (1922) treated five children showing clinical evidences of rickets, confirmed by X-ray examination of the bones, by systematic exposure to the rays of a mercury quartz lamp. This was followed in every case by a healing of the rachitic process in the bones. The changes in the phosphorus of the serum following the light treatment were the same as when the children were given cod liver oil. The pigmented skin of Negroes did not interfere with the action of the light rays.

Howland and Kramer (1922-1923) found that in uncomplicated rickets the concentration of calcium in the serum is normal or nearly so, whereas the phos-

phorus concentration is low, so that the product of the two concentrations is at or below 30. They pointed out how significant the products of these concentrations are.

McCollum and Davis (1915), in a study devoted to the effect of the composition and amount of the mineral content of the diet on growth and reproduction, employed a diet which led to surprising results in that all the lots failed to repeat reproduction at normal intervals. They concluded: "This failure is certainly the result of some factor other than the character of the mineral content and must remain unexplained for the present." This antedated the remarkable work of Evans and Bishop (1922) on vitamin E.

When Goldberger undertook the prevention of pellagra in institutions by improving the dietary little was known of the properties of the different natural food-stuffs which subsequently have become known through the systematic studies of individual foods by means of the biological method of analysis introduced by McCollum and Davis (1915).

Voegtlin (1920) tested on over 100 pellagrous patients the effects of two types of diets on the clinical condition of the disease. Voegtlin and Harris (1920) reported pellagra in infants who were nursed by pellagrous mothers, and cited older literature which shows that a considerable number of cases of pellagra have been observed in infants.

Whipple and Robschey-Robbins and their co-workers (1925-1928) studied the effects of different food-stuffs on blood regeneration in normal dogs made anemic by repeated bleeding. As early as 1920 Whipple and Robschey-Robbins found kidney essentially the equal of liver in blood regeneration.

In order to discover whether the mammary gland could synthesize vitamins A and B, McCollum and Simmonds (1916-1918) carried out a series of experiments with lactating rats whose diets were faulty in known respects. The results showed conclusively that vitamins A and B pass into the mother's milk only when they are present in the diet of the mother.

The chapter on the pregnant and nursing mother strikes the keynote of this book. It affords proof of the existence of, and points the way to the remedy for one of the greatest sources of human inefficiency and suffering. It almost dramatically leads up to what is a fundamental fact: that the nursing mother cannot, except in a very limited degree, put into her milk from her bodily reserves that which she does not receive in her food supply. McCollum also stressed the need for care in the management of maternal and infant diets in combatting the deplorable condition of teeth in America.

Lange and Simmonds (1923) noted no significant difference in the reaction to infection of rats infected with bovine tubercle bacilli by subcutaneous inoculation on diets of varying protein content either in the general condition, weight curves, or in the gross or microscopic autopsy findings. Lange (1925) continued the study of the effect of deficient diets on the susceptibility of the rat to experimental bovine tuberculosis.

In 1919, McCollum, Parsons, and Kalmbach sought and found the opportunity to test on human beings to what extent the principles established in animal experiments apply to the nutrition of children. They were able to demonstrate the validity of the view that a dietary selected from cereals, tubers, fleshy roots, and meat does not prove satisfactory for the physical development of young children. It showed further that milk is an effective supplementary food for such a type of diet; this has been repeatedly shown to be the case with animals.

McCollum and Simmonds have repeatedly emphasized an inter-relationship between the quality of the food supply and the span of life of experimental rats, and have pointed out that, with our present knowledge, it is easily possible to make the span of life of this species anything that is desired up to perhaps 40 months.

In the bibliography the names referred to which are of interest in this article are Adams, McCollum, Abel, Bailey, Hyde, Davis, Whipple, Estill, Hart, Fuller, Howland, Kramer, Boone, Casparis, Shelling, Shear, Orent, Tisdall, Kruse, Davis, Drescher, Halpin, Hoagland, Kennedy, Parsons, Pitz, Rask, Becker, Simmonds, Shipley, Kinney, Grieves, Park, Guy, Powers, Polvogt, Holt, Voegtlin, Myers, Harries, Neill, and Hunter. Most of these names represent investigators who worked with McCollum—some before he came to Maryland, others after. Some of the names are those of individuals who had some connection with Maryland although some of their work was not done here.

The work summarized and paraphrased here gives only a part of the research with which the names of McCollum and his co-workers are connected. A mere list of the papers written by this group of investigators would fill more space than is allotted for the subject. Moreover, to list all the men who have contributed to nutritional research and to give a few details of their works would likewise require too much space. However, this information can easily be obtained by reference to *Men of Science*. A few of the names taken at random may be referred to only as examples of what could be done were there available space.

Dr. J. J. Abel, Hopkins, 1883-1884; Pharmacol. Hopkins, 1893- ; Editor, *Jour. Pharm. and Exp. Therap.* Work: Composition of animal tissues and fluid; function and isolation of special chemical principles of animal organisms; pharmacological action of alcohols, active principles of the pituitary gland; histamine and like substances in animal tissues and hydrolytic products; isolation of the pancreatic hormones; chemical and biological properties of insulin in crystalline form.

Dr. J. C. Hemmeter, Prof. Physiology, Sch. Med., Maryland, 1891-1909, Clinical Professor Diseases of the Stomach, Coll. of P. & S. Baltimore. Work: Physiological at this time was Clinical Professor of Diseases of the Stomach, Col. of P. & S. Baltimore. Work: Physiology and pathology of the digestive organs; physiological foundation of piano technique; history of physiology and medicine; diseases of the intestines.

Dr. B. Kramer, Inst. Pediat., Hopkins, 1917-1920; Assoc. Prof., 1920-1922; Assoc. Pediatrician, Hopkins Hosp., 1923-1924. Work: Inorganic components of blood; rickets; calcification.

Dr. W. S. McCann, Assoc. Prof., Hopkins, 1921-1924; Assoc. Physician, Hopkins, 1921-1924. Work: Disorders of metabolism.

Dr. E. L. Opie, A. B., Hopkins 1893; M. D., 1897; Asst. Bacter., Hopkins, 1899-1900; Instr., 1900-1901; Assoc., 1901-1904. Work: Histology and pathology of the pancreas and its relation to diabetes mellitus; diet in relation to certain toxic substances; protozoan micro-organism related to the malarial parasites; eosinophile leucocytes; necrosis and cirrhosis of the liver; enzymes and anti-enzymes of inflammatory exudates; pneumonia and influenza; immunity, tuberculosis.

Dr. E. A. Park, Johns Hopkins, Baltimore; Medicine, Pediatrics, AB, Yale, 1900; MD, Columbia, 1905; Instr. Path., Columbia, 1909-1911; Assoc. Prof. Pediat., Hopkins, 1914-1921; Prof., Yale, 1921-1927; Sch. Med., Hopkins, 1927-. Work: Rickets.

Dr. L. G. Rowntree, Asst. Med., Hopkins, 1907-1908; Instr. Pharmacol., 1908-1910; Assoc. Exp. Therapeut., 1910-1913; Assoc. Prof. 1913-1914; Med., 1914-1916. Work on water balance, water intoxication, vivi-diffusion.

Dr. John Ruhräh, MD, Col. P. & S., Baltimore, 1894; Prof. Diseases of Children, Maryland. Work: Medical history, nutrition, dietetics and introduced soybean into infant feeding.

Dr. Carl Voegtlin was Assistant Med., Hopkins 1904-1905; Assoc. Prof. Pharmacol., 1906-1913. He worked on metabolism, function of the parathyroid, calcium treatment of tetany, dietary theory of pellagra, vitamins and deficiency diseases, biochemistry of cancer.

Dr. G. H. Whipple, MD, Johns Hopkins, 1905; Asst. Path., Hopkins, 1905-1906; Instr. 1906-1907; Res. Pathologist, 1908-1914; Assoc. Path., 1908-1910. Work: Pigment metabolism, pancreatic lesions, and hemoglobin formation in anemia.

If one examines outstanding books or treatises one will very likely be rewarded by names of men who made noteworthy contributions to the subject of Nutrition. For that reason the writer has resorted to this method. Again only a few examples may be given owing to lack of space.

Among the contributors to Abt's System of Pediatrics are the following Marylanders: J. Howland, J. H. Mason Knox, Jr., Dean Lewis, J. Ruhräh, F. H. Garrison (on the history of Pediatrics), R. A. Bolt (former lecturer at Hopkins), W. C. Davison, and L. B. Hohman. The subjects are not entirely on Nutrition but they are on various phases of pediatrics. The system is composed of eight volumes, copyright 1923-1926, W. B. Saunders Co. Its editor, I. A. Abt, is a graduate of J. H. U., 1889. He is also author of *The Baby's Food* (1917) and the editor of pediatric volumes in the Practical Medicine Series (1906-1921).

●
In his *Introduction to the History of Medicine*, F. H. Garrison refers to Howland's studies of metabolism in

infancy; to the work of McCollum, Davis, and Kennedy (1913-1916) on vitamins A and B; to the production in rats of experimental rickets by dietetic deficiency by McCollum and Simmonds (1917); and to Howland and Park's (1920) X-ray check of the cod liver oil treatment of rickets. The studies of E. L. Opie (1901) and W. G. MacCallum (1909) on the pancreas are mentioned as well as Halsted's (1906) and MacCallum's and Voegtlin's work on tetany.

Harvey Cushing's (and associates at Hopkins) remarkable work on the pituitary is discussed in detail (1908, 1912, 1913). Then, as a surprise, there is this mention: "The most important advance made by chemical investigation in the early period was in the physiology of digestion. The first work in this field, in order of time, was the graduating thesis of John R. Young, of Maryland '*An Experimental Inquiry into the Principles of Nutrition and the Digestive Process*' (Philadelphia, 1803)." Others mentioned include: L. F. Barker for, among other things, his work as editor of a systematic work on Endocrinology and Nutrition and J. C. Hemmeter, a pioneer in radiography of the stomach (1896) and duodenal intubation and author of the earliest complete American treatises on diseases of the digestive organs (1896), stomach (1897), and the intestines (1901), and a manual of physiology (1913).

In McLester's book on *Nutrition and Diet in Health and Disease*, many references are made to Marylanders. As one would expect, McCollum and his co-workers are referred to extensively; other names appear among which Marshall, Keefer, Perlzweig, McCann, Longcope, Barker, and Sprunt may be mentioned.

Although published in 1928 by the Chemical Foundation, the book *Chemistry in Medicine* is reviewed here because it represents a cooperative treatise intended to give examples of progress made in medicine with the aid of chemistry before that date. In this book, Chapter 2 on *Heredity and Development* is written by Alexander Weinstein, Ph.D., who has been associated with the work in Zoology at the Johns Hopkins University. Chapter 4 on *The Story of the Discovery of the Vitamins* is written by E. V. McCollum, Ph.D., Sc.D. and Nina Simmonds, Sc.D. In this brief resumé is recorded a most interesting development to which the authors contributed a major share. Chapter 5 begins a series of articles under the heading *The Conquest of Dietary Diseases*; Article 1 *No Child Need Have Rickets* is written by James M. Gamble, MD, who was associated at the Johns Hopkins Medical School (1915-1922) with the late Dr. John Howland. In this article there is recorded the discovery by Howland and Kramer in this country and, independently, Iversen and Lenstrup in Denmark, that the concentration of phosphate ion in the blood plasma is greatly lowered in rickets. Article 2 entitled *The Hormones of the Suprarenal Glands* is a part of the general heading of Chapter 6; "Chemical Regulators of the Body"; John J. Abel, MD and E. M. K. Geiling, Ph.D., MD are the authors.

Doctor Abel is our most famous American in the field of study of the chemistry of life. Associated first with the University of Michigan as a Professor in its

Medical School (1891-1893), his life work has been done almost exclusively at Johns Hopkins University (1893 to the present writing). Article 4 of Chapter 6 is entitled *The Hormones of the Pituitary Secretions* and is written by E. M. K. Geiling, Associate Professor of Pharmacology, J. H. M. S., since 1921 an associate of Abel. Chapter 8, *The Alleviation of Suffering*, has its first article *Chemistry in Medical Diagnosis*, written by Leonard G. Rowntree, MD, who found an opportunity for his active interest in medical research in the Johns Hopkins Medical School (1907-1916). Article 6 of Chapter 8 is entitled *Chemistry and High Blood Pressure* and is written by Ralph H. Major, MD, who studied at Johns Hopkins. Other articles are written by John W. Churchman, MD, who was associated with the Johns Hopkins Medical School as Instructor in Surgery and the Johns Hopkins Hospital as Resident Surgeon and by Carl Vogtlin, MD, who was associated with the Johns Hopkins Medical School in the Department of Pharmacology from 1904-1913.

In Graham Lusk's *Elements of the Science of Nutrition*, W. H. Howell's work (1906) is recorded as having first indicated the absorption of amino-acids by the blood and the first actual isolation of amino-acid from blood was reported by Abel, Rowntree, and Turner (1913-1914). Again, the remarkable work of McCollum and Hoagland (1913-1914) on protein metabolism is discussed. Attention is directed to the description by McCollum, Simmonds, Shipley, and Park (1922) of the "line-test" procedure, a delicate biological test for calcium-depositing substances. Park and Howland (1921) are accredited with their original demonstration by means of X-ray observations that cod liver oil was administered to children with rickets when curative results were discernible in two or three weeks. Again space is not available to describe other original researches by Kramer, Howland (Ca determination, infantile tetany), to the work of Boggs and Morris (1909) (blood fat in experimental anemia), to the work of Mosenthal and Lewis (1917) in Janeway's Baltimore Clinic described as "one of the most interesting researches upon diabetes ever accomplished," and to the extensive studies of Jones and his school (Buell, Perkins, Amberg, Richards, Partridge, Austrian) on nucleic acids.

In their book *Diet in Health and Disease* Julius Friedenwald and John Ruhräh have endeavored to give a reasonably concise account of different kinds of foods, their composition and uses, and also to set forth the principles of diet both in health and disease. This book represents a wealth of experience having gone through six editions, the last in 1926, the first in 1904.

In it references are made to McCollum, Boggs (estimation of protein, a test for which is suggested-Bull. J. H. H. Oct. 1906); Dr. Manuel Gichner (for revision of a large part of the article on Diabetes); Rowntree, (water intoxication-Arch. Int. Med. XXXII, 157, August 1923); Holt and Howland, Osler (Tuberculosis and importance of diet); and McCann. A series of experiments is recorded which were performed by the authors

in the Pathologic laboratory of the Johns Hopkins Hospital, Baltimore, in which actual cirrhotic changes in the liver were induced by the administration of alcohol. Reference is also made to Welch (*The Physiologic Aspects of the Liquor Question*); Barker and Sprunt (Addison-Biermer type of pernicious anemia); Mosenthal (various test diets devised for testing renal function); Howland and Marriott (Treatment of acidosis); Halsted and Finney (under heading Diet and Laparatomies); and to Cushing and Livingood (J. H. H. Reports - Vol. IX in reference to Stomach and Small Intestine). The book gives a remarkably complete set of hospital dietaries for diseases, individuals, institutions, etc. It includes a section on recipes and devotes sections to *Cuts of Meat*, *Rapid Reference Diet-Lists*, and *War Dieting*. The book is the acme of completeness and even includes a chapter on *Army and Navy Rations*.

Dietetics for Nurses by Julius Friedenwald and John Ruhräh has gone through five editions, the last in 1924, the first in 1905. In the preface the authors write that "the aim of this book is to give the essentials of dietetics." Its table of contents shows that it follows the larger book on *Diet in Health and Disease*. It is simplified for nurses' classes.

Julius Friedenwald and John Ruhräh jointly made some observations on the effect of certain diet cures in diabetes mellitus in 1905, and again in 1910 they investigated the use of the Soybean as a food in diabetes.

In 1924-1925, a series of lectures was given at the Mayo Foundation and a number of universities. These were published in book form by W. B. Saunders Co., 1925. Pages 137 to 208 are devoted to *Our Present Knowledge of Vitamins* by E. V. McCollum. Throughout the volume, names of Marylanders are mentioned. McCollum and Simmonds (1925) published a small book entitled *Food, Nutrition, and Health*, written for the general public. A *Special Insulin Number* (1922) of the *Journal of Metabolic Research* again refers to a number of Marylanders among whom are L. F. Barker, Julius Friedenwald, D. R. Hooker, W. H. Howell, E. V. McCollum, E. K. Marshall, L. H. Weed, and M. C. Winternitz.

In Osler's *Principles of Practice of Medicine*, McCrae (10th edition, 1927, 1st ed. 1892), Section 4 is devoted to Deficiency Diseases and Section 5 to Diseases of Metabolism. In the discussion of gout some important work by Fitcher is mentioned and under Haemocromatosis, mention is made of Sprunt's admirable paper on this subject which appeared in the *Arch. Int. Med.* July 1911.

In *Diseases of Infancy and Childhood* by Holt and Howland (Ninth edition 1927, first edition, 1897) it is noted that the editions since 1911 represent more and more the revising and rewriting ability of Dr. Howland. Other names connected with this edition are Wilburt C. Davison and E. A. Park. Section 2 of the book is devoted to Nutrition. Vitamins are discussed on Page 112. Under Rickets on Page 188, the names of McCollum, Park, and their associates are mentioned. On page 205, Kramer's name is mentioned. Section 3 is devoted

to *Diseases of the Digestive System*. Park and Holt are referred to on Page 278, Flexner on Page 295 (dysentery in children in Baltimore). Celiac disease is discussed on Page 308 and Howland's name should be mentioned in this connection (personal communication, E. A. Park).

J. Whitridge Williams' *Obstetrics* (5th Edition 1926, 1st in 1903), discusses metabolism at the time of labor, general metabolism in pregnancy, and in eclampsia. Diet during pregnancy and puerperium are also discussed.

The author had originally intended to list certain noteworthy references as they appear in the Surgeon General's Index Catalog (1886-1906 and 1906-1925), in the libraries of Baltimore (Welch and Medical Chirurgical) and in the Quarterly Cumulative Index, but space is not available. By glancing through these references one can almost read the story of Nutrition in Maryland. It was also intended to list the various nutritional journals not only because many of them are printed in Baltimore, but because members of their editorial staffs and many of their contributions have come from Maryland.

In closing, one may write that probably no one more than McCollum has shown us what constitutes an adequate diet, and how the physiologic processes are perverted when errors of diet exert their effects. He has pointed out the "Protective Foods," and he initiated those cooperative studies on rickets which demonstrated the existence of a fourth vitamin. With such a beginning there is no reason to doubt that many remarkable discoveries still await the nutrition investigator. □

The MPP Nurse. A Special Person.

All the nurses who work for Medical Personnel Pool are special. What makes them so special? Being a skilled professional and being associated with other professionals with extremely high standards of excellence. Knowing their skills will be fully utilized by MPP staff's careful assignment matching. And also, very importantly, by being able to devote as much time to their nursing career as they wish without sacrificing their personal lives.

MPP's concept of flexible scheduling allows our employees to work as many hours as they wish or as little on the days and weeks convenient to their individual schedule. Everyone benefits as valuable nursing skills which would otherwise be lost are being provided for patient care.

A flexible schedule is only one of the many benefits that await you when you work for Medical Personnel Pool, one of the most highly respected nursing services in its field. Choice of assignments, extensive insurance coverage including professional and general liability and worker's compensation insurances, in-service education, competitive salary, and a reputation for high standards are just a few of the others.

To learn more about the many opportunities awaiting you at Medical Personnel Pool, stop by your local MPP office.

Non-Ossifying Fibroma

By MARK C. VACCARO, MD

Dr. Vaccaro is affiliated with the Department of Radiology of the University of Maryland Hospital, Baltimore, MD 21201, where he can be contacted for reprint and other data.

Case History

A 16-year-old black male presented to the emergency room with pain in his distal right leg and ankle following a football injury at school. Physical exam revealed several ecchymotic areas over his anterior lower leg, but there was no tenderness to palpation or limitation of motion. Radiographs of the distal tibia and ankle were obtained (Figures 1 and 2).

1. What is your diagnosis?
2. What entities should be considered in the differential diagnosis?

entail diagnosis?

3. Should a biopsy be performed?

4. What is the natural course of this lesion and what is its clinical management?

Answers on next page.

DOCTORS IN THE NEWS:

Johns Hopkins physician **Carol Johnson Johns, MD** has been named Acting President of Wellesley College in Massachusetts effective Sept. 1, 1979. A member of the College's Class of 1944, Dr. Johns has been a member of its Board of Trustees since 1971, currently serves on the Board's Executive Committee and has been Trustee Chairman of the Wellesley National Development Fund Committee. Associate Professor of Medicine at the Hopkins School of Medicine, where she received her MD in 1950, the Med-Chi Councillor is an internationally-known expert in chest disease. She is a member of the Baltimore City Medical Society and the Maryland and American Thoracic Societies, too. □

Figure 2: Lateral view.

Radiological Case of the Month

Case history on preceding page.

Discussion

The diagnosis is non-ossifying fibroma, unrelated to the patient's acute trauma.

Non-ossifying fibromas are frequently discovered incidentally in children and young adults when an extremity is examined radiographically for another reason such as trauma. These benign lesions often have such a characteristic radiographic appearance that biopsy is usually not warranted. This entity commonly affects the cortical metaphyseal regions of long bones of the lower extremities, although short bones and bones of the upper extremity may be involved. The lesion is primarily radiolucent, two-seven cms. in size, and is oval in shape with a scalloped margin. This margin is narrow, clearly-defined and sclerotic. The overlying cortex is thinned and expanded, but does not show a periosteal reaction unless a pathologic fracture has occurred. Early lesions are eccentric in location within the metaphysis; however, as they grow, they may fill the entire thickness of the bone. The occurrence of a non-ossifying fibroma encompassing the entire thickness of a bone is more commonly-seen in the slender bones such as the fibula or ulna rather than in the larger bones. As was the situation with this patient, the lesion may have a multilocular appearance.

Non-ossifying fibromas are almost always solitary; however, they can rarely be multiple. These lesions are found incidentally in individuals between eight and 20 years of age, and they are almost always asymptomatic. Surgery may be performed for pain or a pathologic fracture.

Local excision is the procedure of choice for small lesions, whereas surgical curettage and bone grafting may be necessary for the larger lesions.

Although the radiographic appearance of non-ossifying fibromas is almost pathognomonic, a few entities might be considered in a differential diagnosis. Monostotic fibrous dysplasia may have a similar appearance; however, the lesion in fibrous dysplasia is more centrally-located in the metaphysis and is less radiolucent. Non-ossifying fibromas may have a few apparent loculations, but the lesion of fibrous dysplasia may have many, at times giving it a "soap bubble" appearance. A unicameral bone cyst could be considered; however, the eccentric location of the non-ossifying fibroma and its frequent lower extremity location should be helpful in making the distinction.

When non-ossifying fibromas are examined pathologically, they have a reddish-brown to yellow appearance and vary from soft to firm in consistency. Histologically, these lesions are composed of connective tissue of varying cellularity. In the heavily-cellular areas of the tumor, spindle-shaped fibroblasts and multinucleate giant cells are found. Since this type of tissue is rather vascular, red blood cells and hemosiderin pigment can be found, which give the tumor its reddish-brown appearance. Other tissue within the

lesion contains lipid-laden macrophages, which account for the yellowish color.

The relationship of the non-ossifying fibroma to the very frequent benign fibrous cortical defect is still somewhat controversial. The question arises as to whether these two lesions are separate entities or whether they are manifestations of one disease process presenting at different stages of development. The benign fibrous cortical defect is a rather small metaphyseal focus of tissue which radiographically has a lytic appearance involving the bony cortex. A large percentage of normal children show one or more benign fibrous cortical defects, averaging one-two cms. in size. These lesions have a peak incidence between ages four-eight years, and they spontaneously regress. Histologically, these cortical defects are identical to non-ossifying fibromas, and because of this finding, many individuals prefer to place both the benign fibrous cortical defect and the non-ossifying fibroma under a single category such as fibrous metaphyseal defects or fibroxanthomas.

Most benign fibrous cortical defects regress and heal spontaneously. Some investigators, however, believe that a small percentage of these cortical defects do not heal but, rather, continue to enlarge to become non-ossifying fibromas. Most non-ossifying fibromas are then believed to heal spontaneously, as do the benign fibrous cortical defects, as it is rare to find a non-ossifying fibroma in an older adult. The spontaneous healing of non-ossifying fibromas as documented by serial radiographs has been presented in the literature. The process may take several years, during which the defect becomes less and less defined. The former site of the lesion may remain as a sclerotic zone of bone or the site may have a completely normal appearance.

In summary, non-ossifying fibromas are benign metaphyseal lesions of children and young adults. These lesions are often so characteristic radiographically that biopsy is usually not warranted. Although most of these lesions are clinically silent and regress spontaneously, some require surgical intervention for pain or pathologic fracture. Non-ossifying fibromas and benign fibrous cortical defects are biologically and histologically identical and frequently thought of as manifestations of a single entity.

DOCTORS TAKE NOTE:

Oct. 19-20, Crit. Issues in Health Law, Sheraton Wash. Hotel, Wash., DC, sponsored by Amer. Soc. of Law and Med. For details, call Lee J. Dunn, Jr., Esq. at (312) 649-2900.

A 200-Year-Old Book of Patient Records

Suppose that some of your patient records somehow survive the next 200 years and are found among the papers of your great-great-great-grandchild. In a time when man may manipulate body tissues in a laboratory to grow hearts, kidneys and other organs for surgical replacement of diseased and worn-out parts; when cancer, the cardiovascular diseases and others have been eliminated and have been replaced by conditions that we consider obscure, or are totally ignorant of, as the number one, number two, etc., killers of that future time, what would be the reaction of a physician studying your notes? Can you imagine someone dismayed at the barbaric idea of implanting a nuclear-powered, mechanical device inside the body to regulate heartbeat? Think of the medical instructor who looks at your charts and then refers to the crudeness of transplanting a kidney from a cadaver, or even a *live* donor, to the body of a patient with kidney disease? The columnists and popularizers of medicine 200 years from now, after examining your records, may discuss the ineptness of the physicians of our prescientific time who were helpless in the face of cancer.

I say all this as an introduction because I have in front of me a manuscript book of approximately 90 pages, entitled *Medical Cases as They Occurred in Harford County, Taken by John Archer, Jr., MD*. The manuscript came to light about three months ago as part of the estate of Dr. Archer's great-grand-great-grandchild and was acquired by the Faculty just a few days ago. The manuscript describes the significant cases seen and treated by Dr. Archer between the years 1792-1805. He was the son of the first physician to obtain a Medical Degree from an American medical school, and he studied first under his father at Medical Hall in Harford County, MD. Later, he received his MD degree from the University of Pennsylvania, where he studied under Benjamin Rush. The variety of cases described in this young medical graduate's notebook illustrate American medicine at its best, during the period immediately following the American Revolution. Given the rapid advance of medical knowledge today, it is likely that medicine even 100 years from now will be far more advanced from that of the present day than present-day medicine is advanced over what is described in this notebook. This fact should lead us to humbly approach this picture of medicine 200 years ago as an illustration of how much we have to learn, rather than of how far we have come.

At the bottom of his title page, Dr. Archer wrote the following quote from his teacher, Benjamin Rush: "Record all facts and extraordinary occurrences in the practice of medicine." Thus, the theme was set for the new physician's notebook.

The title page is followed by a six-page list of prescriptions; these describe the recipes for various ointments, tonics and pills that were the primary therapeutic tools of the American physician of the time. The recipe for mercurial ointment instructs the physician to put crude mercury into a brazen mortar, melt a small piece of rosin in a ladle and add turpentine until the mixture is about the consistency of honey, cool the mixture and pour it on the mercury, stirring it until it is entirely "killed." This ointment was used to treat a variety of diseases including syphilis and various skin diseases such as cancer.

Another recipe, for Extract of *Cicuta*, states that hemlock is to be gathered when the flowers begin to fade. The herb is to be bruised, the juice expressed and then boiled gently until two-thirds is wasted. The pulp is then formed into balls, spread on a marble plank and dried to a proper consistence for pills. The recipe concludes with a note, "Apparent effects—giddiness of the head—motions of the eyes as if something pushed them outward. Dose—gradually to be increased, but should it occasion spasmodic twitchings, heat and thirst, the use of it must be forbidden."

The list of prescriptions is followed by a five-page list of preferred treatments for specific diseases, all quoted from physicians associated with the University of Pennsylvania. Dr. Wistar is cited as the source of an alum prescription to be used for diabetes, a recipe using flour, yeast and finely-powdered charcoal to form a poultice to treat gangrene, and also as stating "The bladder should always be punctured above the pubic when necessary to draw urine by puncture." For ascites, Dr. Archer copied Benjamin Rush's prescription for juniper berries mixed with wine, of which a wineglass full is to be taken three times a day.

Next follows a four-page section entitled *Virtues of Trees*. The bark, roots and leaves of various trees are listed according to their astringent, tonic or diuretic effects. We learn that an extract of ash bark was used to treat snake bites, a paste of ground laurel leaves was applied to corns, tea made from nettle leaves was used to treat amenorrhea, a tincture formed from cayenne was used as a wash for treating rheumatism and dried skunk root in doses of 10 grams, three times a day, was recommended for pulmonary phthisis.

Smallpox was probably the major medical problem in the American colonies. In 1792, when Dr. Archer began practice, Jenner's research on vaccination was still six years from publication, and inoculation was the accepted prophylactic measure against smallpox. Following his list of prescriptions and standard cures, Dr. Archer has a seven-page section on inoculation, pointing out that

"Infection may be used out of the mature pock or prepared. Infection is prepared by wetting the thread in fresh variolus matter and drying it gradually before the fire and keeping it in a vial for use. Inoculation is carried out by an incision to be made in a fleshy part of the arm or leg . . . not more than thro the cuticle to the cutis, so as hardly to draw blood and no more. If matter just out of the pock is used, dip the point of the lancet in the matter and rub it on the incision until dry— If prepared infection is used, cut the thread . . . about the eighth or tenth of an inch in length, then wet the point of your lancet in water which applied to the thread you cut off and when it is moistened, apply it to the incision and rub it on until you get some of the dissolve matter in the incision, then expose it to the dry air . . . The second or third day, open the incision . . . and apply of the fresh or prepared matter as before. Nothing more is to be done respecting the operation. If the infection has taken place, about the fifth day the part will be a little raised and inflamed."

Dr. Archer recommended giving two purges: one on the fifth day after inoculation, and the other on the occasion of the fever to prepare the patient for a mild form of smallpox. He also recommended that small quantities of mercury be given every night to assist the purges. The eruptions on the inoculated patient would last from about the eighth day until the 15th day; during this period, the patient was encouraged to go into the open air and to use moderate exercise. If the patient felt obliged to go to bed, he was to get up frequently and go into the open air. Dr. Archer reports that in the winter of 1795, there were 500-600 persons inoculated for the smallpox. His notes go to great lengths to describe complications among those inoculated and the procedures used to treat them, but he does not mention any fatalities.

The next 40 pages of the manuscript describe individual cases of 17 diseases treated by Dr. Archer: a carious ulcer in the nose, phthisis pulmonalis, cutaneous eruption, nitre taken into the stomach, epilepsy, amenorrhoea (sic), pendulous abdomen, poisoned feet, tinea capitis, dysentery, chronic dysentery, spirit taken into the stomach, copper taken into the stomach, afterpains, dropsy, herpes, scarlatina anginosa and stone in the bladder.

In describing each case, Dr. Archer seemed to follow a standard format. First, there is a paragraph written in the third person, naming the patient, specifying the date that the patient made application to Dr. Archer for a particular problem and stating the duration of the problem. If the patient had consulted other physicians, this is also noted. This paragraph usually ends with the words: "The doctor directed as follows—" One or more prescriptions follow for the medicines that the doctor directs the patient to take or use. After each prescription, there is a term such as "solution" or "pills" to identify the various medicines for the patient's use. If several pills are to be used, they are described as "red pill," "black pill," "white pill," etc.

Following the prescriptions, there is an account of the doctors directions to the patient. These usually start off in the third person, worded very formally as, "the patient will," etc., but frequently the text changes to the second person and becomes an exact quote of the doctor's words. Today, when malpractice problems have made it very important that physicians record

conversations with, and directions to, each patient, Dr. Archer's notations could serve as models.

The first case, "A carious ulcer in the nose," presents a good illustration of the format of these records: "Miss E. Day made application to Dr. Archer Dec. 1792 for an ulcer in her nose of three months standing; a piece of bone had exfoliated and come out of the nostril— she had made application to several physicians without having any advantage. The doctor directed as follows—" Prescriptions follow for a solution, pills, a mixture and an ointment. There are a great deal of shorthand and many symbols in the prescriptions that make it difficult for even a modern physician or pharmacist to decipher them. A primary ingredient in the solution, pills and ointment was mercury.

Following the prescriptions, the record goes on: "Miss Day will rub a piece of ointment large as a bean on her nose three times a day and in about an hour after, or before the use of the ointment, put about half a wash-spoon full of the *solution* with an equal quantity of water and with this syringe the inside of your nose twice a day; if it should excite smarting, add a little more water, but if it should produce no smarting, add a little more of the *solution*. One of the pills is to be taken every night and morning. It would be advisable to syringe your nose three times a day with milk and water and should any of the bones become loose, they must be taken out—you may drink but not wash in cold water—should the outside of you cheek or nose take on inflammation, wet it with the *mixture*. The discharge from the nostrils was very offensive—After a considerable time she lost the bones of her nose and the ulcer healed.—"

Time and space do not allow me at this time to go into the details of all the cases presented in Dr. Archer's notebook; however, in future columns, I will occasionally add a transcription of one of these patients' records and hopefully will be able to decipher the prescriptions to make the record more complete.

The manuscript concludes with copies of several letters, one written by Dr. Archer to a man in Talbot County who had been bitten by a mad dog, and several others from physicians around the United States to Dr. Archer relating incidents in their practices. The letter on hydrophobia is especially interesting and worth recounting. It was written Oct. 6, 1796, to a Henry Holliday, Esq., in Talbot County and reads:

"Sir: W. Grogale has informed me you have been so unfortunate as to have been bitten about 11 days by a mad dog, or rather a dog that did go mad 24 hours after he bit you, and that you are desirous of the mode of treatment to pursue to prevent the bad effects arising from a communication of the virus.

"I have some small hope that as the disease in the dog had not taken place so as to produce the rabies that the saliva of the dog was not sufficient so as to be infectuous; but as this is only founded in opinion and not on facts, it will be necessary that you go thro' a regular course of medicine.

"Before I speak to you the mode of treatment and the medicine to be taken, I shall remark that from a careful attention to a number of cases of persons who have been bitten by mad dogs, I have found the period from the day they were bitten to the day there were evident symptoms of an approaching rabies to be about 42 days. In two cases from the bite of mad cats

to be 55 or 56 days— From these observations, I have concluded that the period is the 42nd or sometime between the 42nd to the 56th days, but I am rather of opinion that the 42nd day is the period of the bite of a mad dog for the rabies to commence in man.

"All diseases that are communicated by infection one person to another, or from one animal to another, have their regular periods from the commencement of the infection to the commencement of the disease and that the periods of different diseases are different and in different genera of animals the same disease has different periods; but the same disease to all the species of one genus as the Rabies Canina in dogs, wolves, etc., as 14 or 15 and in man from 42 to 56 days.—From this view of the nature of diseases from infection will arise a mode of treatment to prepare for the approach of the disease so as to render it in a great measure light and easy—another, the treatment of the disease after it has commenced.

"With respect to the preparatory method in Rabies Canina.—As soon as the person is bit, the part should be well-washed for a considerable length of time and I should prefer common soap and water or a solution of salt of tartar, or common lye made of wood ashes—after it is well-washed, rub plentifully of strong mercurial ointment into the part—rub it well each time twice a day and keep a plaster of it constantly applied to the part—as you are bit in the finger let the finger, arm and auxiliary glands be well-rubbed every morning and evening with the mercurial ointment—every night and morning take a mercurial pill of two grains each until your gums get sore and you begin to spit, then the taking of the mercury is to be so regulated as to keep you spitting moderately for 42 days at least or what is the safest to the 56th day after which there is no danger—about the 36th day an emetic of Mercurius Emeticus flavur (sic) alia Turpeth Mineral is to be given. I would also recommend you to take a dycocion of alecarpane root in the following manner—Take two ounces of alecarpane root, slice or bruise it into small pieces, boil it gently from two quarts of water to one quart and bottle it for use—of this drink a large teacupful for a week and again on the beginning of the sixth week and continue it until after the 42nd day—diet to be light and easy of digestion.

"Sir, for your consolation I can with truth say I have had sundry patients who were bit with mad dogs with the foregoing treatment they all escaped the bad effects of the disease and without scarcely a symptom worthy of notice. I will mention one which was a certain mark of their having received the infection—several of those who were bit altho' the part healed which I always expect it to do it inflamed and formed a small blister about the 42nd day attended with some slight transient pains, but the patients not otherwise materially indisposed.

"The treatment of the disease after the symptoms have commenced—but this I trust and am fully persuaded if you follow the preceeding mode of treatment you will have no occasion for.

"First. Should spasms come on and these be full evidence of a Rabies Canina, then I would recommend bleeding until the patient faint—when he recovers from fainting if there be tension or fullness in the pulse and spasms have not ceased, bleed again until he faint and so until the spasms cease.

"Second. In aid of bleeding if the person can swallow, give a teaspoonful of ophir with 20 dollops of laudanum every two or three hours until the spasms cease, but not until bleeding has been first used. Again, I would recommend the habit of body to be laxative by strong blisters given every day. This last part has been added because I am at a distance, but I feel assured that there will be no appearance to require this last treatment—support a cheerful mind and after the duration of 56 days, let me hear from you and be assured I am with respect your very h'ble serv't, John Archer."

Unfortunately, we are not told the final outcome of Mr. Holliday's treatment.

A manuscript such as this, or any old medical text, can be very amusing. We may shake our heads in disbelief at the proposed treatments and wonder at the self-assurance of these physicians of earlier times who

trusted in these treatments. We may be tempted to marvel at the ignorance of medicine at this time, and perhaps to wonder that *any* of the human race survives today, but we in our "superior wisdom and knowledge" forget that these "prescientific" physicians were successful in their practice. Many of their patients recovered, and some succumbed in spite of treatment. The picture has not really changed much; we have managed to eradicate or cure a large number of diseases, but new ones have arisen to take their places. The great advance of medical knowledge only serves to remind us of our ignorance and to impress upon us the fact that in a very few short years (far less than the almost 200 years that separate us from John Archer, Jr.) physicians will be looking back on today's practice of medicine and marveling that mankind managed to survive in spite of what we didn't know.

Did You Know That . . .

. . . wearing a helmet does not hinder vision?

That's right. When standing still, a person has peripheral (side) vision of about 110-115°. When a helmet is put on, the peripheral vision remains the same because certified helmets provide a minimum peripheral vision measuring 120°. This is standing still. Once the cyclist starts riding, his/her area of vision decreases, *but* this is caused by increasing speed (not the helmet) causing a tunnel effect on the cyclist's vision. This happens with *all* moving vehicles, motorcycles as well as cars. The faster you go, the smaller the tunnel and the less you see.

. . . wearing a helmet does not impair hearing?

What a helmet does is provide a screening effect, *but* it screens all sounds to the same degree. Thus, noises that the cyclist doesn't need to hear, such as wind blast, are screened along with other sounds. The cyclist wearing a helmet hears all critical sounds at the same relative strength as the rider without protection . . . except at higher speeds. **THEN THE RIDER WITH THE HELMET HEARS BETTER!** At highway speeds, wind noise becomes a critical factor in the cyclist's hearing. Because the helmet acts as a windscreen, the helmeted cyclist actually hears better at high speeds than the bareheaded rider.

. . . wearing a helmet does not cause neck injuries?

The common argument is that the added weight of a helmet contributes to whiplash injuries; however, whiplash injuries don't happen to cyclists. If a cyclist is hit, the entire body is free to move, but when a car is hit, only the driver's head and neck move violently over the back of the front seat. This snapping action is what causes whiplash. Whiplash injuries are peculiar to car accidents, and, yes, a helmet does add extra weight, *but* only for a day or two; then the neck muscles adjust and you don't feel any "weight problem."

The chances of taking a direct blow on the neck during a fall are pretty slim, but the chances that you'll hit your head are over 50%. Most neck injuries occur when the rider's *head* gets bounced on the pavement, or hits a guardrail or cracks somebody's windshield. If the rider isn't wearing a helmet, a neck injury is the least of his/her problems. It's common knowledge that your head sits on your neck, so if a helmet absorbs the impact that would be taken by your head, it also absorbs the impact that would be taken by your neck. Helmets don't cause neck injuries.

. . . helmets do save lives?

During 1978, motorcycle deaths exceeded 4,300, accidents exceeded 175,000. Of every 10,000 motorcycle registrations, 333 will be involved in an accident. It could happen to you, even though you might not be at fault. Be smart—wear protective equipment—including a helmet.

Your solution to professional office space

Westminster Professional Center could very well be your answer!

Picture your situation: limited space; no parking;
and high overhead.

Consider your alternative: a large modern
professional office building geared to the medical
profession with functional office interiors to fit
your needs; ample on-site parking; and a monthly
overhead that's on your side.

For more information please contact:

WESTMINSTER PROFESSIONAL CENTER

Book Reviews

COPING WITH CHRONIC PAIN by Nelson H. Hendler, MD and Judith Fenton. Clarkson N. Potter, Inc., Publishers, 1979.

Reviewed by ELIZABETH B. SHERRILL, MD

(Dr. Hendler is Clinical Director of the Mensana Clinic at Stevenson, MD, a teacher at the Johns Hopkins University School of Medicine and psychiatric consultant at the Chronic Pain Treatment Center of Johns Hopkins Hospital. Judith Fenton is Associate Editor of the *American Medical News*, an AMA publication, and has covered major feature stories and medical news events.)

This 166-page book is for physicians and patients, so the writing is simplified to be understandable to both groups, with definitions and explanations. It describes and defines chronic pain, explains pain pathways, categorizes types of pain and modalities of testing and treatment.

I think that physicians could profit from reading this to help allay some of the frustration of dealing with the problem. We are prone to treat chronic pain with increasing doses of controlled drugs until we have created an addict or else refer and refer until the patient is lost.

The treatment entails the long-term, concentrated effort of the patient and his family with a multi-disciplinary approach until the cause is delineated, followed by a team concept of group therapy with the patient until the pain is removed or allayed and the patient can accept some degree of pain.

The modalities are drug withdrawal from analgesics—minor and major tranquilizers, hypnotics, stimulants, anti-depressants, mood elevators, hallucinogens, muscle-relaxants, antiinflammatory and vasoactive drugs. Anxiety increases pain, so thorazine can be as effective post-operatively as morphine if prior counseling is given. The body contains opiates, the endomorphins and enkephalins, which, if it could be stimulated, could alleviate pain. There is research going on in this area.

There is a chapter on drugs as to how they work and why they are used.

Surgical approach may be percutaneous rhizotomy with thermo-coagulation, or disk removal. Nerve block for diagnosis and treatment, either by incision or excision, can be helpful in selected cases.

Electrical stimulation, either by transcutaneous stimulator which blocks incoming pain messages or by implantation in the back or brain, where the results may be better. Psychotherapy (group and family) with a team approach is useful for the insight into causes of disease pains.

Occupational therapy can help the patient improve skills for a present job or accommodation of motion or to learn new skills for job placement. Behavior Modification in groups can help the patient accept a certain amount of pain. Biofeedback for better awareness

helps to gain relaxation; hypnosis (self) to focus attention elsewhere.

Acupuncture may have a placebo effect, but recent research suggests it may stimulate production of a morphine-like chemical in the body.

Physical therapy to relax the taut muscles (from protective response) or following surgery to increase range of motion and strength is also discussed. ☐

DOCTORS IN THE NEWS:

On July 25, 1979, President Jimmy Carter sent a telegram to Dr. **Richard D. Mudd**, 79, absolving his grandfather, the late Maryland physician—**Samuel A. Mudd**, MD, who died in 1883—from any role in the assassination of President Abraham Lincoln in 1865. *Journal* readers will recall the April, 1976 cover story by Managing Editor Blaine Taylor, **Dr. Samuel A. Mudd's Saga: Was the Maryland Physician a Victim or Part of the Lincoln Assassination Conspiracy?**, in which was described how the late Dr. Mudd set the broken leg of alleged Lincoln assassin actor John Wilkes Booth following the famous shooting in Ford's Theater in Wash., DC. The Saginaw, MI-based grandson, a retired industrial physician, said in the exclusive *Journal* interview that he thought his grandfather would be "Cleared, but not exonerated," which is what President Carter actually did. The Med-Chi Council supported Dr. Mudd's petition to have his grandfather cleared by a Resolution passed Sept. 11, 1971. ☐

We Also Repair Jewelry

In our own shop, the same skilled craftsmen who create our fine jewelry also do the repairs.

For this type of work you will find our prices in line—even less in many instances.

If a stone needs to be reset, if a pin is broken, if a ring is to be made larger or smaller—these jobs are just as welcome as an elaborate remount. Feel free to consult us.

American Medical Association Education and Research Foundation . . . AMA-ERF

AMA-ERF, as we Auxilians know it, is engaged primarily in supporting the cause of medical education; that is to say providing financial assistance to medical students, interns and residents via the Loan Guarantee Fund, and "flexible funds" for the nation's 116 accredited medical schools.

The Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland has the good fortune to have Mrs. Elmer G. (Elizabeth) Linhardt serving as State Chairman of this very important program. Elizabeth's efforts are directed to coordinating, corresponding and communicating on behalf of AMA-ERF with the component Auxiliary Chairmen and Presidents. Because of her own dedication toward the worthy cause of AMA-ERF, she inspires contagious, enthusiastic support for AMA-ERF in every member of the Auxiliary.

Elizabeth arrived in this position after an interesting lifetime in association with the medical profession. She is of German-American extraction with "roots" in South Baltimore. After a temporary move to Anne Arundel County in her early years, she returned to her native Baltimore and began paraprofessional training at St. Agnes' Hospital. Working in the Outpatient Clinic under the direct supervision of Sister Zoe Shaughnessy, DC, PhG and in the field of Physical Therapy, Medical Technology and Radiologic Technology under Sister Ann Hunter, DC, RT, Elizabeth had exposure to

many eminent Baltimore clinicians of that era, the senior members being Drs. John T. O'Mara, Firmadage K. Nichols, B.E. Seegar, Emil Novak, Austin (Pappy) Wood, George A. Stewart, L. Clarence Cohn and also the "youngsters" of that time: Karl F. Mech, John C. Dumler, George Govatos, Robert F. Healy and Charles R. Marek. Most importantly, Eugene L. Flippin, MD, Radiologist for St. Agnes, contributed much to Elizabeth's education in the field of -ray technology.

A turning point in her career occurred when Elizabeth married Dr. Elmer G. Linhardt following the completion of his internship at St. Agnes' Hospital in 1938, and, once again, Anne Arundel County, specifically Annapolis, became "home." Although Dr. Linhardt became a member of Med-Chi in 1938, Elizabeth did not join the Auxiliary until, as she recalls, "Irene Bauersfeld of Montgomery County was State Treasurer, and dues were \$2 for State and \$1 for National."

She feels "As a physician's wife, it is both a privilege and an obligation to belong to the Auxiliary."

Following a tour of duty during World War II with the United States Air Force, Dr. Linhardt returned to private practice in 1945 and, in the ensuing years, Elizabeth became the dedicated mother of two children. As all her projects in the past have been successful, so these two are rapidly developing also. Angela, their lovely daughter, is a graduate of the Peabody Institute

AT THE 1979 MED-CHI ANNUAL MEETING:

CHECKS from the AMA Educational Research Fund were presented to Dr. J. Richard Gartner, Associate Dean for Administration at the Johns Hopkins University School of Medicine (left) and John M. Dennis, MD (right), Dean of the University of Maryland School of Medicine, by AMA-ERF Chairman Mrs. Elmer Linhardt (left) and Auxiliary President Mrs. Thomas Herbert (right.)

(Photo by Tadder, Balto.)

and is presently teaching piano as a professional. Their son, George Elmer, is in the second year of a surgical residency training program at the University of Maryland.

Keenly interested in the health needs of others, when the children were young students at St. Mary's Grammar School and later St. Mary's High School in Annapolis, Elizabeth is credited with establishing the school's Health Room. This activity required recruiting and training mothers for volunteer staffing of the facility. The program included the audiovisual screening of 800 students annually, with the cooperation of the Anne Arundel County Health Department, which supplied the equipment, in addition to providing TLC for first-graders and bandaids, etc., for the football team. This was a special volunteer activity for Elizabeth for a period of 16 years.

During these years, Elizabeth became a charter member of the Auxiliary of the American Society of Abdominal Surgeons; charter member of the Auxiliary of the International College of Surgeons; an Auxiliary member of Anne Arundel General Hospital and a member of the North Arundel General Hospital Auxiliary as well. Elizabeth has also served the Med-Chi Auxiliary as Members-At-Large Chairman and Treasurer.

Following the example set by her predecessors, Mrs. John (Arlene) Baybut and Mrs. Wallace H. Sadowsky (Bea), Elizabeth has conscientiously dedicated her efforts to AMA-ERF since the beginning of the Auxiliary year 1967-68. "Not by contributions alone" became evident, so following the direction of National Chairmen Lela May Young, Maida Smoth and, later, Ruth Johnson, Edith Lessenden and Kay Reardon, "merchandising for AMA-ERF" became the accepted method of raising supplementary funds for the program. Boutiques sprang up at meetings in every state; locally, through the support of Med-Chi, which generously supplied space, Maryland, too, was afforded the opportunity to "show and sell." The wide variety of items has covered genuine Indian turquoise jewelry, original scrimshaw, Maryland ties, teapots, stationery and watches, to name a few. It is a customary sight to see Elizabeth arrive a day ahead of a meeting accompanied by a multitude of cartons bulging with AMA-ERF merchandise. Raffles—oops! "shares"—have proven a most lucrative method of raising funds. Again, through the generosity of Med-Chi (John Sargeant, specifically), who furnished tickets for trips to Mexico, Bermuda and, more recently, New Orleans, share tickets were circulated, each component auxiliary receiving full credit for its sales. Traditional Christmas cards are an annual project by which physicians and Auxiliary members painlessly support AMA-ERF. This project begins when most of us are thinking of steamed crabs. Careful planning ensures distribution and, as the project progresses, Auxiliary members eagerly await progress reports, hoping to exceed the previous year's record. A variety of continuing projects, such as art auctions, dinner dances, bus trips, Doctor's Day benefits and other major functions, are left to the discretion of each individual component Auxiliary.

Oh! The gigantic, accurate, record-keeping Elizabeth completes is tremendous!

Perhaps a "first" in the history of AMA-ERF, Maryland, through the efforts and guidance of Elizabeth, sponsored an invitational Eastern Region Workshop. We were privileged to have National Chairman Mrs. Quentin L. Quickstad (Barbara) in attendance and conducting the most important aspects of the program, introducing a slide presentation as an additional educational means of emphasizing the need for support of AMA-ERF.

Elizabeth also serves the Faculty as well as the Auxiliary for AMA-ERF. This year's spectacular total of \$27,980.51 achieved by the Auxiliary is summarized thus according to Elizabeth, "The success of 1978-79 clearly demonstrates the importance of TEAMWORK, and you have been an outstanding team to work with." It is energetic, interested people working together which contributes to successful achievement. Compare this year's accomplishment to the goal of 1968, which then was \$7,000. Heartiest congratulations to AMA-ERF and Elizabeth Linhardt.

The greatest recompense of Elizabeth's outstanding volunteer efforts, combined with the support of Faculty members, plus the diligence and energy of Auxiliary members, are summarized in her own words, "The greatest reward will come when the totals are in and you know the great satisfaction achievement." She also regards the AMA-ERF program as "The most meaningful, most rewarding, most frustrating, most demanding and the most challenging of ALL programs in Auxiliary work." Also through her efforts, Elizabeth has earned the respect and admiration of many National officers, as well as other State AMA-ERF chairmen. Her sincere dedication, excellent leadership and superior devotion to the vital need of AMA-ERF is superlative and exemplary to all of us.

This kind of activity by the Auxiliary, guided by an energetic, enthusiastic, dedicated Chairman, is of tremendous importance to those who turn to AMA-ERF for financial support in their pursuit of a medical career, and the dividends of Elizabeth Linhardt's volunteer activities will return to the profession as enthusiastic, energetic young professionals take their places among the ranks of those delivering health care in our nation.

Maryland is scheduled (at press time) to receive two national awards this year at the National AMA Convention, July 21-25 in Chicago; one, "For the state Auxiliary in the Eastern Region with the largest contribution per capita" and as stated by the National Chairman, "I know Elizabeth Linhardt will be particularly happy to see the Auxiliary to the Harford County Medical Society receive the award for the county Auxiliary in the Eastern Region with the largest contribution per capita." Both are coveted awards, for they acknowledge the *individual* accomplishment.

It is Elizabeth Linhardt, our Chairman, whose dedicated, diligent efforts and contagious enthusiasm is spirited for AMA-ERF in every member of the Auxiliary, the medical society, staff and friends. □

Rehabilitation Medicine

FREDERICK J. BALSAM, MD Editor

Spasticity Modified by Obturator Nerve Block

By GERALD FELSENTHAL, MD

Dr. Felsenthal is Associate Chief of the Department of Rehabilitation Medicine at Sinai Hospital of Baltimore and Assistant Professor in the Department of Rehabilitation Medicine at the University of Maryland School of Medicine. Address reprint requests to Dr. Felsenthal at Dept. of Rehab. Med. Sinai Hospital of Baltimore, Belvedere Ave. at Greenspring, Balto., MD 21215.

Abstract

Spasticity is a frequent complication of many diseases of the central nervous system, such as multiple sclerosis. Frequently, a flexed adducted position of the thigh develops which interferes with functional activities and good nursing care. Obturator nerve block (ONB) is a procedure useful for the reduction of this position. In this paper, the gain in thigh abduction and hip extension after complete obturator nerve block was measured. In the absence of contracture, the increase in abduction was between 10-25° and in extension between 10 and 50°. The effect of a block of either the anterior or posterior division alone was also recorded. Measurements also indicated a post-block increase in knee extension of between 4-28°. This is explained by study of the kinesiology of the muscles directly or indirectly affected by the obturator nerve block. The observation of generalized reduction of spasticity after blocking a single peripheral nerve is explained by the interruption of the afferent and efferent fibers of the blocked nerve and by the decreased afferent input from the antagonistic muscles which are no longer being stretched by the spastic contraction of the muscles innervated by the blocked nerve.

Introduction

Obturator nerve block has been utilized primarily as a technique to reduce thigh adduction spasticity, particularly in patients in whom the adducted flexed position of the thighs interferes with functional activities (i.e., ambulation or wheelchair transfers) and/or the goals of good nursing care (cleanliness, continence of urine, prevention of joint contractures and decubiti). This technique has several advantages over other procedures and medication which may be considered in trying to accomplish these same goals (Table One). In addition, it has been a common clinical observation after phenol block of the obturator nerve that flexion spasticity in the hip and knee has also decreased. This is particularly evident when the block has been done before contracture has developed in the thigh adductors and hip and knee flexor muscle groups. The tech-

nique for doing an obturator nerve block¹ and the rationale for selecting phenol as the neurolytic agent have been reviewed in prior publications.² This paper documents the effectiveness of ONB using phenol, as performed by a physician trained in this technique, and offers a rationale for the relaxation observed at joints not primarily affected by muscles innervated by the obturator nerve.

Table One:

Advantages of an Obturator Nerve Block

1. Versus Obturator Neurectomy and/or Adductor Tenotomy for Spasticity or Contracture
 - A. Avoids delay in the rehabilitation program
 - B. Avoids secondary effects of surgery
 1. Inactivity and associated complications
 2. Decreased motor skills and endurance
 3. Possibility of infection
 - C. More readily accepted by patients (especially with multiple sclerosis) than a permanent procedure
 - D. Partial procedure for limited therapeutic effect easily performed
 - E. Easily repeatable procedure when clinically indicated
 - F. Applicable when surgery contraindicated
 - G. Useful in evaluating effects of potential surgery
2. Versus anti-spasticity medication
 - A. Avoids increased generalized weakness
 - B. Avoids possible adverse systemic reactions

Method

The anterior and posterior divisions of the obturator nerve are localized, using an electrical stimulator capable of delivering a pulsating direct current through a hypodermic needle that was coated with teflon except at its tip. After precise localization, phenol was injected into each division of the obturator nerve.¹ Range of motion measurements using goniometric techniques were made pre-and post-block. It was ascertained by repetitive measurements that these goniometric techniques were reproducible within five degrees, though accuracy of and clinical significance of changes of less than five degrees was questionable. The lack of full hip extension was determined by placing and holding the contralateral thigh in the maximum obtainable flexed position, thus straightening the lumbar lordosis. The ipsilateral leg was then placed over the side of the table, thus preventing the heel in the presence of knee flexion spasticity from maintaining the hip in flexion. In this position, maximum hip extension was obtained and recorded as the number of degrees lacking of full extension. Similarly, the number of degrees lacking of full knee extension was recorded. Thigh abduction was measured by forcefully abducting the thigh while monitoring movement of the pelvis.

When the pelvis began to move, the number of degrees of abduction of the thigh was recorded. Measurement was made by subtracting 90° from the angle formed by a line connecting the anterior superior iliac spines and the long axis of the thigh. In three cases, measurements were recorded after block of the anterior division of the obturator nerve as well as after both divisions were blocked. In one case, electromyographic (EMG) monitoring of muscles innervated by the anterior division of the obturator nerve, i.e., the adductor longus, and the posterior division, e.g., the adductor magnus, was carried out. The muscles were localized as described by Delagi.³ Recording was done pre- and post-block using a Teca TE-4 Direct Recording Electromyograph. Muscle activity was stimulated by abducting the thigh.

Results

The gains in range of motion obtained after doing an obturator nerve block in five patients are reported in Charts A through E. In each case, in addition to the expected gain in thigh abduction and hip extension, a gain in knee extension was also observed.

In Patient A (Chart A), measurement was made of the gain in hip extension and thigh abduction after block of the anterior division of the obturator nerve. On the right, the patient gained 18° of extension and five degrees of abduction. After blocking the posterior division, an additional two degrees of extension was obtained and an additional 15° of abduction. On the left, after blocking the anterior division, the gain in

hip extension was 10° and thigh abduction 10°. After the posterior division block, an additional gain of 14° of extension and 10° of abduction was observed. Similarly in Patient D (Chart D), after blocking the anterior division of the obturator nerve on the right, a gain of four degrees of hip extension and 10° of thigh abduction was measured. Blocking the posterior division gave a further increase in hip extension of 18°, but no further increase in abduction. On the left, the gain after block of the anterior division was 10° of hip extension and five degrees of abduction. An additional six degrees of extension and five degrees of abduction was obtained by blocking the posterior division. For Patient E (Chart E), after blocking the anterior division the gain in hip extension was two degrees, and in thigh abduction was five degrees. Blocking the posterior division of the obturator nerve gave a further gain of eight degrees of extension and 10° of abduction. These examples illustrate the importance of blocking both the anterior and posterior division of the obtu-

ator nerve in order to obtain the maximum reduction in thigh adduction and hip flexion spasticity.

Figure one (Patient E) demonstrates the electrical activity of the adductor longus muscle caused by pulling the thigh into abduction prior to and after block-

FIGURE 1: Electromyographic activity induced in the Abductor longus muscle by stretch abduction of the thigh pre- and post-block of the anterior division of the obturator nerve.

FIGURE 2: Electromyographic activity induced in the adductor magnus muscle by stretch abduction of the thigh pre- and post-block of the posterior division of the obturator nerve.

ing the anterior division of the obturator nerve. The change in activity was observed within less than a minute of the time of injection of the anterior division. Figure Two demonstrates the continued activity in the adductor magnus with thigh abduction after block of the anterior division. This activity also diminished within less than a minute after blocking the posterior branch. Activity of the adductor magnus could still be elicited by obtaining hip extension even after blocking the posterior division of the obturator nerve since this is a dually-innervated muscle that also receives innervation from the tibial nerve division of the sciatic nerve. These recordings reemphasize the necessity of blocking both the anterior and posterior division of the obturator nerve in order to obtain a maximally-effective nerve block.

The three patients with multiple sclerosis were available for follow-up evaluation post-block. The duration of effectiveness of the block until increased thigh abduction and/or hip flexion spasticity necessitated repeat block was a minimum of four-six months. When clinically-indicated, repeat obturator nerve blocks were done with similar decrease in spasticity and duration of effectiveness as initially noted.

Discussion

The increase in thigh abduction and hip extension after obturator nerve block was understood to be a direct result of the peripheral nerve block. Each of the muscles innervated by the obturator nerve, once it enters the thigh, functions as a thigh adductor. In addition, each of the obturator nerve-innervated muscles, also contributes to hip flexion in varying degrees. Brunnstorm⁴ summarizes the flexion contributions of the adductor muscles as determined by Fick.⁵ The pectineus is a flexor in all positions of the hip joint but, as flexion proceeds, the leverage of this muscle as a flexor decreases to the point of no leverage in extreme flexion. Its work capacity as a flexor surpasses its work capacity as an adductor. The adductor longus acts as an adductor in all positions of the joint. It flexes in the first 70° of flexion, but its leverage decreases progressively to the point of no leverage at 70°. The principal action of the adductor brevis is adduction of the thigh. From the hyperextended position to about 50° of flexion, it is a flexor. The main action of the adductor magnus is adduction. In the extended position and up to about 50° of flexion, the upper obturator innervated portion is a flexor. MacConaill and Basmajian,⁶ however, question the flexor role of the adductor magnus. Their electromyographic study of the adductors showed that during flexion of the thigh, the main activity occurs in the adductor longus, while the magnus is often completely silent. Additional increase in hip extension may occur and be explained without any further decrease in hip flexion spasticity. The tensor fascia lata and sartorius are both accessory hip flexors and thigh abductors and neither is innervated by the obturator nerve. Obturator nerve block would not affect the resting length of either muscle, but it can be postulated that the increased thigh abduction after the nerve block would also allow increased hip extension.

The confirmed clinical impression of increased knee extension after obturator nerve block can be explained without postulating any change in knee flexion spasticity. The hamstring muscles (biceps long head, semimembranosus and semitendinosus) are two-joint muscles causing hip extension and knee flexion. With obturator nerve block and without any change in resting length, any relaxation obtained in hip flexion spasticity would allow an increase in knee extension. The role of the gracilis is ignored in this discussion because it is felt to make an insignificant contribution to knee flexion.⁷

Abramson⁸⁻⁹ and Hirschberg⁸ have shown the reduction of electromyographic activity in the rectus abdominis, rectus femoris and gluteus maximus muscles after ipsilateral obturator nerve section or block. The postulated explanation has been the removal of afferent impulses from strongly contracting muscles, thereby reducing overall spasticity. A kinesiology basis is also available to explain their findings. They mention that in denervating or tenotomizing certain muscles of a limb, neighboring muscles may undergo disuse atrophy rendering them less spastic. Furthermore, they point

out that contracting muscle may produce movement of a limb which stretches other muscles. This stretch in turn may account for the EMG activity observed in their studies as the adductor muscles may provide the stretch stimulus for the observed EMG activity in the rectus abdominis and gluteus maximus and, indirectly via the hamstring, the rectus femoris. The adductors are among the anteriorly-placed downward pelvic rotators and thus stretch the upward rotators including the rectus abdominis. The hip flexion action of the adductors may stretch the hip extensors, i.e., gluteus maximus. The knee flexion action of the hamstrings would stretch the rectus femoris and the increased knee extension obtained after obturator nerve block would allow it to relax.

A generalized decrease in spasticity has been observed after block of a single peripheral nerve. Abramson^{8,9} and Hirschberg⁸ explain this generalized reduction in spasticity after obturator nerve block as the effect of afferent impulses mediated through that nerve. Dimitrijevic and Nathan¹⁰ say that a non-specific reduction of the activity of the alpha motor neurons in the spinal cord is achieved by decreasing the afferent inflow to the spinal cord and that this reduction helps restore reciprocal innervations. Khalili and Betts¹¹ postulate that decreased sensory input from a particular area, because of a larger distribution in the internuncial pool of the central nervous system, gives widespread relief of spasticity in the same limb or others. An alternative explanation has been offered in this paper by study of the kinesiology of the muscles innervated by the blocked nerve and the antagonists of these muscles. In all likelihood, the decrease in spasticity is due to the interruption of the afferent fibers from the muscles innervated by the blocked nerve and to the decreased afferent input from the antagonistic muscles which are no longer being stretched by the spastic contraction of the muscles innervated by the blocked nerve.

Summary and Conclusions

In these five patients, obturator nerve block was determined to decrease thigh adduction and hip flexion spasticity directly and to allow increased knee extension indirectly. The explanation for the decreased spasticity is interruption of the afferent and efferent fibers of the blocked nerve and by decreased efferent input from the antagonistic muscles which are no longer being stretched by the spastic contraction of the muscles innervated by the blocked nerve. Clinically, ONB is a technique, in addition to or as an alternative to medication or surgery, useful in treatment of spasticity that is interfering either with function or good nursing care. The duration of effectiveness of the ONB was clinically observed to be four-six months, and it could be easily repeated as indicated by evaluation of the patient.

Doctors in the News

Dr. Whitley Elected AUR President

Dr. Joseph E. Whitley, Professor and Chairman of the Department of Diagnostic Radiology at the University of Maryland School of Medicine, has been elected President of the national Association of University Radiologists (AUR) at its recent meeting in Rochester, NY.

Formed in 1953, the AUR consists of over 1,500 academic radi-

DR. WHITLEY

ologists in the US and Canada. In addition to representing academic radiologists as a political entity, the organization publishes a scholarly journal and holds an annual convention.

Dr. Whitley joined the University of Maryland School of Medicine in 1978 after a 16-year association with the Bowman-Gray School of Medicine in Winston-Salem, NC. He is a trustee of the James Pickner Foundation, a book reviewer for the *Journal of the American Medical Association* (JAMA), a Fellow of the American College of Radiology and the author of over 50 scientific publications.

Dr. Chambers Made President

Dr. Robert G. Chambers, MD of Baltimore was elected President of the Society of Head and Neck Surgeons at a recent meeting in Pittsburgh. Dr. Chambers is Associate

Professor of Surgery and in charge of the Head and Neck Service at Johns Hopkins Hospital. He is also Assistant Professor of Surgery at the University of Maryland Hospital in Baltimore.

Dr. Chambers also was awarded the Margaret and Norman Gosse Visiting Lectureship in Carcinoma of the Thyroid by the Canadian Cancer Society during the past year. □

SYMPOSIUM ON GI CANCER

November 16-17, 1979

INTERNATIONAL HOTEL

Adjacent to the Baltimore-Washington
International Airport

Presented by

The Oncology Program,
Department of Surgery
and

✚ The Program of Continuing Education
University of Maryland School of Medicine

This course is designed to address current modalities of diagnosis of G.I. Cancer as well as the role of surgery, radiotherapy, and adjuvant chemotherapy in primary cancer's of the esophagus, stomach, pancreas, small bowel, liver and colon-rectum. It will also address the role of chemotherapy in metastatic disease and the new agents that are being investigated for use in G.I. Cancer.

For additional information contact:

Program of Continuing Education
University of Maryland School of Medicine
10 S. Pine Street, Balto., MD 21201
(301) 528-3956

MONEY AVAILABLE UNSECURED

For Physicians, Dentists, (in practice or training), and
Executives. \$5,000/\$50,000. Terms up to 72 months. No
Pre-payment penalties. No front money required or accepted.

PRACTICAL CLINICAL ENDOCRINOLOGY

October 26-27, 1979

INTERNATIONAL HOTEL

Adjacent to the Baltimore-Washington
International Airport

Sponsored by

The Division of Endocrinology
and

✚ The Program of Continuing Education
University of Maryland School of Medicine

This symposium offers the opportunity to practitioners to familiarize themselves with useful, practical knowledge about some of the more common endocrine and metabolic disorders. The evaluation of clinical data, the interpretation of diagnostic tests, and current therapeutic trends will be reviewed and stressed.

For recurrent attacks of urinary tract infection in women

Bactrim™ DS Double Strength Tablets

Each tablet contains 160 mg trimethoprim and 800 mg sulfamethoxazole.

Just one tablet b.i.d. for 10 to 14 days

- Action at urinary/vaginal/lower bowel sites helps eliminate reservoirs of infecting organisms
- Distinctive antibacterial action plus wide spectrum helps eradicate recurrent UTI
- Low incidence of bacterial resistance in community practice

- Convenient *b.i.d.* dosage provides day-and-night antibacterial control
- Contraindicated during pregnancy and the nursing period. During therapy, maintain adequate fluid intake; perform CBC's and urinalyses with microscopic examination.

Before prescribing, please consult complete product information, a summary of which follows:

Indications and Usage: For the treatment of urinary tract infections due to susceptible strains of the following organisms: *Escherichia coli*, *Klebsiella-Enterobacter*, *Proteus mirabilis*, *Proteus vulgaris*, *Proteus morganii*. It is recommended that initial episodes of uncomplicated urinary tract infections be treated with a single effective antibacterial agent rather than the combination. *Note:* The increasing frequency of resistant organisms limits the usefulness of all antibacterials, especially in these urinary tract infections.

Also for the treatment of documented *Pneumocystis carinii* pneumonitis. To date, this drug has been tested only in patients 9 months to 16 years of age who were immunosuppressed by cancer therapy.

The recommended quantitative disc susceptibility method (*Federal Register*, 37:20527-20529, 1972) may be used to estimate bacterial susceptibility to Bactrim. A laboratory report of "Susceptible to trimethoprim-sulfamethoxazole" indicates an infection likely to respond to Bactrim therapy. If infection is confined to the urine, "Intermediate susceptibility" also indicates a likely response. "Resistant" indicates that response is unlikely.

Contraindications: Hypersensitivity to trimethoprim or sulfonamides; pregnancy; nursing mothers; infants less than two months of age.

Warnings: Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been associated with sulfonamides. Experience with trimethoprim is much more limited but occasional interference with hematopoiesis has been reported as well as an increased incidence of thrombopenia with purpura in elderly patients on certain diuretics, primarily thiazides. Sore throat, fever, pallor, purpura or jaundice may be early signs of serious blood disorders. Frequent CBC's are recommended; therapy should be discontinued if a significantly reduced count of any formed blood element is noted.

Precautions: Use cautiously in patients with impaired renal or hepatic function, possible folate deficiency, severe allergy or bronchial asthma. In patients with glucose-6-phosphate dehydrogenase deficiency, hemolysis, frequently dose-related, may occur. During therapy, maintain adequate fluid intake and perform frequent urinalyses, with careful microscopic examination, and renal function tests, particularly where there is impaired renal function.

Adverse Reactions: All major reactions to sulfonamides and trimethoprim are included, even if not reported with Bactrim. *Blood dyscrasias:* Agranulocytosis, aplastic anemia, megaloblastic anemia, thrombopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia. *Allergic reactions:* Erythema multiforme, Stevens-Johnson syndrome, generalized skin eruptions, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis. *Gastrointestinal reactions:* Glossitis, stomatitis, nausea, emesis, abdominal pains, hepatitis, diarrhea and pancreatitis. *CNS reactions:* Headache,

peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo, insomnia, apathy, fatigue, muscle weakness and nervousness. *Miscellaneous reactions:* Drug fever, chills, toxic nephrosis with oliguria and anuria, periarteritis nodosa and L. E. phenomenon. Due to certain chemical similarities to some goitrogens, diuretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused rare instances of goiter production, diuresis and hypoglycemia in patients; cross-sensitivity with these agents may exist. In rats, long-term therapy with sulfonamides has produced thyroid malignancies.

Dosage: Not recommended for infants less than two months of age.

Urinary Tract Infections: Usual adult dosage—1 DS tablet (double strength), 2 tablets (single strength) or 4 teasp. (20 ml) b.i.d. for 10-14 days.

Recommended dosage for children—8 mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses for 10 days. A guide follows:

Children two months of age or older

Weight		Dose—every 12 hours	
lbs	kgs	Teaspoonfuls	Tablets
20	9	1 teasp. (5 ml)	½ tablet
40	18	2 teasp. (10 ml)	1 tablet
60	27	3 teasp. (15 ml)	1½ tablets
80	36	4 teasp. (20 ml)	2 tablets or 1 DS tablet

For patients with renal impairment:

Creatinine Clearance (ml/min)	Recommended Dosage Regimen
Above 30	Usual standard regimen
15-30	½ the usual regimen
Below 15	Use not recommended

Pneumocystis carinii pneumonitis: Recommended dosage: 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

Supplied: Double Strength (DS) tablets, each containing 160 mg trimethoprim and 800 mg sulfamethoxazole, bottles of 100; Tel-E-Dose® packages of 100. Tablets, each containing 80 mg trimethoprim and 400 mg sulfamethoxazole—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 40, available singly and in trays of 10. Oral suspension, containing one teaspoonful (5 ml) the equivalent of 40 mg trimethoprim and 200 mg sulfamethoxazole, fruit-licorice flavored—bottles of 16 oz (1 pint).

Please see back cover.

Her next attack of cystitis may require

the Bactrim™ 3-system counterattack

Bactrim has shown high clinical effectiveness in recurrent cystitis as a result of its wide spectrum and distinctive antimicrobial action in the urinary, vaginal and lower intestinal tracts.

The probability of recurrent urinary tract infection appears to be enhanced by the establishment of large numbers of *E. coli* or other urinary pathogens on the vaginal introitus. The trimethoprim component of

Bactrim diffuses into vaginal fluid in effective concentrations, thus combating migration of pathogens into the urethra.

Studies have shown that Bactrim acts against *Enterobacteriaceae* in the bowel without the emergence of resistant organisms. Thus, Bactrim reduces the risk of introital colonization by fecal uropathogens. It has *no* significant effect on other normal, necessary intestinal flora.

Bactrim fights uropathogens in the urinary tract/vaginal tract/lower intestinal tract

Please see reverse side for summary of product information.

MARYLAND STATE MEDICAL

FIRST LADY GREETS "DOCTOR OF THE YEAR" AT THE WHITE HOUSE:

*First Lady Rosalynn Carter shakes hands with Dr. J. Roy Guyther as Dr. W. Jack Stelmach, President of the American Academy of Family Physicians, watches at a July 18, 1979 ceremony at the White House. Dr. Guyther, who is from Mechanicsville, MD, was honored as **Good Housekeeping's** "Family Doctor of the Year," an award given annually by the magazine in conjunction with the AAFP. Dr. Guyther is the third recipient of the annual award, which was first given in 1977. . . . see page 35*

Many physicians are seeking relief from the ever increasing pressures of private practice. If you are a physician, and less than 56 years of age, the United States Air Force Medical Service offers you an alternative and a unique challenge.

The Air Force physician participates in a group practice environment with the entire spectrum of medical specialties available. Air Force hospitals are accredited and are fully equipped. Health care is provided to every patient without regard for his ability to pay.

Benefits provide a secure and satisfying lifestyle, including 30 days of annual

paid vacation, professional pay and recreational opportunities.

Consider the Air Force as an alternative to your present practice. Positions are available in primary health care delivery, and a few major medical specialties.

Starting salaries and rank are commensurate with education and experience. Assignment to a specific Air Force Hospital within the United States or overseas may be arranged.

Consider Air Force Medicine. Excellent pay and benefits, professional challenge and educational opportunities make the Air Force Medical Service a viable alternative to private practice.

PERFORMANCE. PROVEN EFFECTIVENESS WITHIN A WIDE SAFETY MARGIN.

While Roche Laboratories already knows more about the performance of Librium than anyone else, we keep on learning every day.

For example, the highly favorable benefits-to-risk ratio of Librium is a well-documented matter of record.

And, of course, the specific calming action of Librium has been demonstrated in millions of patients around the world. In a large number of these patients, Librium was used concomitantly with other primary medications.

Proven performance within a wide safety margin. Basically, that's what Librium is all about.

LIBRIUM® chlordiazepoxide HCl/Roche THE ANXIETY-SPECIFIC

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of anxiety and tension occurring alone or accompanying various disease states. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malforma-

tions as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as heeded and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Supplied: Librium® Capsules containing 5 mg, 10 mg or 25 mg chlordiazepoxide HCl. Libritabs® Tablets containing 5 mg, 10 mg or 25 mg chlordiazepoxide.

Downs on Severn: Located just north of Annapolis on the Severn River, between Brewer and Clements Creeks.

We saved the best for last.

The final section of incomparable homesites at Downs on Severn is now being offered for sale. We saved the best for last: the tip of the spectacular promontory jutting into the beautiful Severn River, only minutes from Annapolis.

As this offer is announced, we are completing a 68 slip marina and a new clubhouse with swimming pool and tennis courts for the exclusive use of the residents of the Downs.

Pick from a wide selection of

waterfront and waterview homesites, of not less than one acre size. Although expensive, they are extraordinary, and, as such, you will want to consider seriously their inclusion in your building plans.

Only 35 minutes from Washington: Beltway to Rt. 50, east to Crownsville turnoff, west on Generals Hwy. (Rt. 178), right on Old Rt. 178, right on Sherwood Forest Rd., right on Coachway to Downs on Severn. Open 7 days a week noon till 5 PM, or call for an appointment.
From Washington: 261-8880,
from Annapolis: 849-8300.

The Maker

Examining a Few Myths About Prescribing.

Increasing pressure is being put on the practicing physician to prescribe drugs generically. You are told that brand-name products are universally "expensive" and generic versions are relatively "cheap." To make this case, the most extreme (rather than typical) price differentials are cited. Thus, consumers are led to believe that such differentials are commonplace. Even your knowledge and your motives as a physician are questioned.

Understandably, these views have created myths. We think it's time to examine them in the light of all the facts and ramifications.

MYTH: There are no differences in quality and performance between brand-name products and their generic counterparts. The corollary is that there are no differences among products made by high-technology, quality-conscious, research-based companies and those made by commodity-type suppliers.

FACT: The Food and Drug Administration does a good job in monitoring a generally excellent drug supply. Still, it has nowhere near the resources to guarantee the quality and bioavailability of all marketed products at any given time. Just a few months ago, for example, it noted that batches of tetracycline HCl capsules which met official monograph requirements were

not bioequivalent to a reference product. As you know, there is substantial literature on this subject affecting many drugs, including such antibiotics as tetracycline and erythromycin. The record on drug recalls and court actions affirms strongly that there are differences among pharmaceutical companies and their products. Research-intensive companies have far better records than those that do no research and may practice minimum quality assurance.

MYTH: Industry favors only "expensive" brand names and denigrates all generics.

FACT: PMA companies make 90 to 95 percent of the drug supply, including, therefore, most of the generics. Drug nomenclature is not the important point; it's the competence of the manufacturer and the integrity of the product that count.

Matters.

MYTH: *Generic options almost always exist.*

FACT: About 55 percent of prescription drug expenditure is for single-source drugs. This means, of course, that for only 45 percent of such expenditure, is a generic prescribing option available.

MYTH: *Generic prescriptions are filled with inexpensive generics, thus saving consumers large sums of money.*

FACT: Market data show that you invariably prescribe—and pharmacists dispense—both brand and generically labeled products from known and trusted sources, in the best interest of patients. In most cases the patient receives a proven brand product. Savings from voluntary or mandated generic prescribing are grossly exaggerated.

MYTH: *Drugs account for a major portion of the rise in health care costs.*

FACT: Drugs represent a very small part of such costs. The amount of the health care dollar spent for prescription drugs was about 12 cents in 1967; today it is about 8 cents. And you as a physician are most conscious of how drug therapy can cut hospitalization, avert surgery, reduce office visits and keep patients on the job.

MYTH: *Government intrusions into the marketplace will save tax money.*

FACT: Government schemes always cost the taxpayer something, and the costs often exceed the benefits. Certainly, any federal “help,” such as lists of wholesale drug prices sent to all physicians and pharmacists, will be no exception. Just think of the expense of keeping them current! Moreover, wholesale prices are poor guides to actual transaction prices and even worse guides to retail prices.

The PMA Position

We believe your freedom to prescribe, either by generic or brand name, should be totally unabridged. Otherwise, your prescribing prerogatives and your relationships with patients will be seriously impaired.

The maker does matter

After the myths about price and equivalency have been shattered, one fact stands out more clearly than ever: *The maker does matter.* As always, your best guide to drug therapy for your patients is to select products—both brands and generics—from manufacturers with credentials and performance records you have come to respect.

The logo for the Pharmaceutical Manufacturers Association (PMA) consists of the letters 'PMA' in a bold, stylized, serif font. The 'P' and 'M' are connected, and the 'A' is separate.

Olesker on Dr. Pierpont

To the Editor:

I must comment on Dr. Ross Pierpont's story in your June, 1979 issue, (Ed. note: **The Strange Case of Dr. Pierpont—Could This Happen to You?—BT.**) in which he makes passing—and inaccurate—reference to my alleged role in his legal problems.

According to Pierpont, when I called to question him about his impending criminal indictment, he told me, "Look, if you will treat this off the record and confidential, I will tell you what I know."

At that point, according to Pierpont, I said, "Absolutely," and proceeded to break my word the next day.

I must assume Pierpont is a far better physician than he is a reporter. Let's start with the above colloquy:

There was **never** any mention of going off the record. There are plenty of people who do talk to me off the record, and if Pierpont wants to check with any of them—**any**—he'll find that I keep my word. A reporter who doesn't is headed for a very fast fall.

The truth is, our conversation opened—and, unlike Pierpont, I have notes which I took during our talk—with me saying, "Ross, I have information you're about to be indicted. What's this all about?"

His reply: "Mike, I was gonna call you about that."

(Why he would be calling me on such a matter seemed outlandish. We had neither a professional nor personal closeness, but I let the remark slide.)

He said, "Can I call you back tomorrow and we'll talk about it?"

My reply: "Ross, I'm working on deadline. I've got to talk to you tonight."

No mention of off-the-record. No mention of confidentiality.

I won't quibble with his (partial) account of the remainder of our conversation. He did say something about his attorney, George Russell, working hard on the case. He did mention that he felt it was a case of entrapment. I reported his comments.

What he does **not** mention, in his account in your magazine, is that he told me: "Mike, you're not gonna believe this, but this whole thing is a Communist conspiracy."

Let us leave this bit of lunacy aside for the moment.

The following morning, I telephoned Pierpont's attorney, George Russell, to tell him I had talked to his client and to ask his reaction to the impending indictment.

I took notes on that conversation, too, and here is the dialogue:

Olesker: "George, I talked to Ross last night about this indictment."

Russell: "Oh, no! I told that dunny not to talk to anybody about this. What did he tell you?"

Olesker: "Well, he blames it on the Communists."

Russell: "Oh, no..."

Incidentally, if Pierpont really had asked to talk off the record, and if I had lied to him, is it really likely I would have followed that by phoning his attorney for reaction? Would anybody be so brazen in a "betrayal?"

The fact is, there **was no** betrayal. There was no request for commenting off the record. I was reporting to the public that a prominent member of our community was about to be criminally charged. I was doing my job, and I did it fairly and honestly and thoroughly. I didn't have to call Pierpont at all, but I wanted to allow him the chance to tell his side of the story. I didn't have to call Russell, either, but having heard Pierpont's lame excuse, I wanted to give him one more chance by talking to someone on his side capable of articulating the case more clearly.

One last point: My initial inclination, when reading Pierpont's account, was to brush it off as the sad, twisted delusions of a broken man.

I feel sorry for him. He's a man who worked his way from nothing to a position of high respect in portions of our community, but trying to blame me for his problems is unfair and inaccurate, and I want to set the record straight.

MICHAEL OLESKER

(Managing Editor's Note: During the Pierpont case, Mr. Olesker was a reporter with the **Baltimore News American**, and is now a columnist with the **Baltimore Sun**.—BT.)

"Further Comment" on Hypnotism . . .

To the Editor:

Blaine Taylor's interview with Dr. Edward O. Hunt, Jr. (**Medical Hypnosis Versus Hypnotism: What They Are—and What They Are Not**, July, 1979) is astute, comprehensive and deserves further comment.

The term, "**hypnotism**" does not refer to the occult. It merely indicates the **study** of hypnosis, or the act or practice of inducing it. A number of texts include the word, "hypnotism" in their titles (Bramwell, Estabrooks and Weitzenhoffer's excellent book). The term "**hypnosis**" is generally used to refer to a **state**, which only resembles normal sleep, but which differs in having been induced by the suggestions and operations of the hypnotist and is different from the electroencephalogram of sleep.

Hypnotism, which began with Mesmer's concept of "Animal Magnetism," has developed into an approach, which emphasizes the psychological processes of the hypnotized patient. It includes motivations, expectations, attitudes, previous experiences with hypnosis, basic trust and the nature of the relationship to the hypnotist (transference-readiness). The needs of each individual patient are significant, and may include masochistic, aggressive, infantile, dependent and sexual need gratifications.

Every physician who uses hypnosis, therefore, must learn all that he can about the patient's "defenses," the manner, in which each patient reacts to him and to the hypnotic induction experience. Does the patient have a fear of losing control, and therefore, resists being hypnotized? Is the patient concerned that he will fail, as he has failed in other aspects of his life, or does he desire to be overpowered? Is he becoming more anxious, as the interpersonal relationship to the doctor-hypnotist develops?

Whether the physician remains a mere technician or becomes an effective medical hypnotist, will, therefore, depend upon his understanding of these motivational, psychodynamic principles. Some suggestible patients cannot be hypnotized, since it is not just a matter of being more suggestible. Hypnosis also includes a capacity to suspend one's critical judgment and the ability to tolerate reality distortion.

The hypnotic state is not fixed or static. It is a particular kind of interpersonal relationship, which quickly develops between the patient and the hypnotist. Each participant influences, and is **being** influenced, by the other. This is just as true in medical hypnosis, as it is in hypnotherapy.

The doctor, who uses office hypnosis, like Dr. Hunt, will frequently be treating Anxiety and Depression, as well as inducing relaxation, when examining the acute or sensitive ("ticklish") abdomen, facilitating the removal of stitches, drains, dressings, the administration of intravenous fluids or maintaining the fixed position of limbs in plastic surgery. Hypnosis has been used in chronic skin disorders, to overcome urinary retention (secondary to spasm and fear), in persistent hiccups, obesity and to overcome the habits of smoking and alcoholism in **selected, good** hypnotic patients.

Hypnosis should always be used with the **full** consent of the patient. The **sicker** a patient is, the **better** a hypnotic patient he will be. Pain is not only physical and mental, it is a form of interpersonal communication—a kind of message, which always includes a demand for relief and comfort. The severely burned patient, the woman in labor and the patient with intractable cancer pain respond effectively to the doctor-patient relationship, which is the **basic** ingredient of hypnotic therapy.

Dr. Hunt is to be congratulated upon his skill and the use of hypnosis in the practice of surgery and medicine. Physicians can bring much comfort and relief of pain to their patients, if they use hypnosis as an

DR. CONN

DR. HUNT

adjunct to the procedures with which they are familiar and competent.

"... Interest and Nausea ..."

To the Editor:

With a mixture of interest and nausea, I read the prattle of Gerald K. Walters with a newly coined degree, PAC, after his name (Ed. note: Letter, **The Physician Assistant**, in **Open Forum**, July, 1979—BT.) I am a little puzzled as to why organized medicine and its publication should countenance such stuff to the degree that it would see fit to put it in a journal.

For many years, we nurses have worked closely with physicians and required no fanfare, special recognition or compensation above what an ordinary nurse would get. Of course, there are mavericks in our ranks such as the nurse practitioner. The whole thing reminds me of the story of **The Arab and the Camel**, which every school child has heard at one time or another.

The advent of our medical brethren from the North of us, from the South of us, and from overseas that we call our FMGs plus the great number now being graduated from our own schools, would seem to preclude the possibility of needing these auxiliaries.

Privately, physicians will state that they fear they have created a monster and seem to think that one day they will become strong enough to request some form of licensure to perform on their own.

Good doctors, look not at short-term gains, but to the future, and it is later than you think!

BEVERLY E. WILLIAMS RN, BS, MED

A simple solution for beating the high cost of feeding babies.

Powdered Soyalac mixed with water (according to directions on the label) is an inexpensive, soy-based infant formula your patients can buy.

Up to 50% less expensive than ready-to-serve formulas.

Up to 25% less expensive than liquid concentrates. Including our own!

Soyalac is the only leading milk-free infant formula available as an inexpensive powder. It provides exactly the same nutritional balance as Soyalac's con-

centrated and ready-to-serve infant soy formulas — at a fraction of the cost.

Your patients who use formula will appreciate knowing about it.

For detailed information and samples, please call or write the Soyalac sales representative in your area.

Editorial: In What Direction?

It is with a modicum of satisfaction that I write this Editorial, for how often in a lifetime can one say "I told you so." Beginning 10 years ago, and this can be documented by a series of articles which were published, attention was called to the fact that there was too much testing in terms of laboratory and, later, the more sophisticated remarkable instruments, such as what was then termed the gastroscope, now referred to as the endoscope and, of course, the scanning and multiple other procedures which have since then been developed. These procedures are very expensive and I was impressed, as were numerous other observers, that a contribution to the escalation of medical costs was generated by doctors, who ordered these tests, who repeated them sometimes over and over, who often did not seem to know what the real indications were for some of the more specialized procedures and, therefore, there accumulated in the record a beautiful, thick chart which, in many instances, swerved from the patient's complaint and the immediate reason for the patient's admission. I have seen and can document that some abnormal findings by the computer were often treated, apart from the fact that they did not relate to the patient's condition and could, in fact, be laboratory errors. I have witnessed, in doing my consultations, many evidences of patients who have been tested beyond imagination without any convincing documentation in the chart that a careful, meaningful history was taken, nor was there a careful development of the patient's symptom complex, nor were there meaningful or legible progress notes. This led, at one time, to the writing of a short article on **The Diagnostic Sentence** in which it was stressed that if a doctor sat down with the patient and took a proper history, carefully-directed into meaningful channels, he/she could be handed a diagnosis by the patient instead of doing what is being done to this day, i.e., hoping that, by numerous testings, the brain will be relieved of its ability to make a diagnosis and that perhaps the hopper will produce the diagnosis.

Now we have cost containment committees at every level, from the city societies to the state societies to national societies, all agreeing that the doctor, who, one must admit, generates costs, can also control them if he/she took time to diagnose and treat human beings (patients) rather than consider them as objects for testing. Most doctors have no knowledge of the costs of the examinations they are ordering and some, who are expert at certain procedures, will continue to do them almost routinely or upon request.

My original observation had to do with the endoscopic procedures because I thought that too many of them were being done even when the diagnosis was already in the record, and it should be added that the cost for these procedures is no small amount. This same criticism applies to CAT (Computerized Axial Tomography) scanning, although I understand that there is a movement on the part of the heads of departments in some institutions which do CAT scanning that such procedures will not be done unless there is a real indication. Other diagnostic imaging procedures overlap to an extraordinary degree (except the superspecialist) because, when available, they are done, although here, too, there is overlapping and no selectivity.

These Pagers Mean Business.

Renting A Beeper?

A significant portion of your monthly charge is for equipment — **not** the actual paging. The rental price includes equipment, paging and maintenance.

Ownership Reduces Monthly Charges

The most practical solution to lowering the monthly charge for paging is to supply your own equipment. In this manner you can save up to \$13.50 **each** month! Coverage and convenience remain the same.

Choosing Your Communications Supplier

Evaluate total costs — purchase price **and** maintenance. Every pager sold by Mountainside has a 3 year parts and labor warranty, assuring you of no hidden extra charges. Whatever your paging needs, whichever features you require, they are available with our equipment.

Mountainside Electronics

4828 Hollins Ferry Road • Baltimore, Maryland 21227

(301) 242-1900

I believe, basically, that procedures, and especially expensive ones, should be selectively done. There should be no blanket permission to do them on minimal or routine grounds. I also believe that when the hospitals were made to do audits, these audits often resulted in the performance of practically every test on the audit because without such "complete" investigations, the doctor would have been considered to be delinquent in his/her workup of the patient. Audit reviews were compulsory, the order coming down from a higher level, but now they have been dropped and we have focus reviews which, I believe, are beneficial, but they also set up certain routines. These routines should be followed for a while until the lesson is learned, but then there should be such a quality of medicine practiced that the well-trained physician is able to do the necessary testing as he/she needs it, but again remembering above all that he/she is treating human beings, which means more than test procedures.

It is a pity that the art of the practice of medicine has lost so much ground to the technological, perhaps overly-scientific, approach not only in terms of diagnosis, but also in terms of therapy because, when one errs, the other must. Remember, I am not objecting to progress in medicine and I acknowledge the need for research and development, but I **do** object to overutilization or poorly-directed utilization. I, for example, said at one time that a subspecialty such as gastroenterology should not become a technological procedure such as endoscopy, and yet, today the average request for a consultation in gastroenterology is as much, if not more, for the instrument than for the doctor's experience and medical knowledge.

Many outstanding names in the field of medicine agree with the view I am expressing here and have made known their profound dismay because they feel as I do that we are, after all, responsible for the medical care of human beings, and **human being means dialogue, listening and, in a word, understanding** the patient or person who is surrounded with multiple problems in an unstable world. It is for this reason that I entitled this Editorial "**In What Direction?**"

I should add that the Medical and Chirurgical Faculty's Ad Hoc Committee (of which I am a member) "To Implement the Intent of Resolution 1S/77" is helping to answer the question, "In What Direction?" It held its first meeting on Nov. 11, 1977 and has been meeting regularly and conscientiously since that date under the able Chairmanship of Harry F. Klinefelter, MD. Resolution 1S/77 was adopted as amended by the House of Delegates at its Semiannual Session of Sept. 17, 1977. I believe it is important to refresh everyone's mind as to the content of Resolution 1S/77. It reads:

"WHEREAS, The cost of health care is increasing at an alarming rate, faster than other costs in this inflationary economy; and

WHEREAS, Medicine is a field where new techniques and methods increase the number of workers, in contrast to most industries, where new methods reduce the number of workers; and

WHEREAS, Most patients are covered by either private insurance or government funds, and, therefore, do not

directly pay or even know their hospital costs and

WHEREAS, The greatest increase in health care costs is in the hospital component and

WHEREAS, Physicians are responsible for admission of patients to hospitals and the ordering of ancillary tests performed in the provision of care to such patients therefore, be it

RESOLVED, That medical school faculty members and the practicing physicians of Maryland are urged to become more cost-conscious and to reemphasize the use of the utmost discretion in admitting patients to hospitals and in ordering ancillary services in patient care.

ORDERED, That the President appoint a special committee to implement the intent of Resolution 1S/77."

Problems seem to grow in today's world; it is a credit to this Ad Hoc Committee that after one and a half years (with much to show in the way of accomplishments) it continues to function effectively.

SAMUEL MORRISON, MD

Editorial: AMA-ERF

Medical-student loans guaranteed by the AMA Education and Research Foundation are important in themselves—and also for a reason that goes beyond money.

This reason is that they demonstrate—in clear, bottom-line terms—that our AMA federation is interested in nurturing tomorrow's physicians.

Since the program's inception in 1962, some 75,000 loans totaling over \$90 million have been guaranteed.

Lately, however, the program's resources have been severely pinched. The demand for loans has been mounting—to a great extent because Federal and other sources of financial assistance for medical education have been drying up while the educational expenses continue to escalate.

Last year, more than 4,000 students and physicians-in-training borrowed through the ERF program. This year there can be no more than 2,000.

It would be a sad day indeed if the program were to languish for lack of sufficient resources to meet the loan demand. In the words of AMA Executive Vice President James H. Sammons, MD: "The program of aid dramatically affirms medicine's confidence in, and unselfish support for, the future of health care in America. The physician contributors and their spouses of the Auxiliary, whose dedicated efforts and generous gifts over the years have provided the resources and energy that make the program live, merit special recognition."

Just a little extra effort from medical families and from all of the state and county societies would do much to proclaim that confidence in our health care's future.

Our Maryland Med-Chi Auxiliary has established an outstanding track record of AMA-ERF support. With a little more effort, Maryland could become the leading supporter of this noble cause. Why not? Maryland medical families have often led in developing, supporting and promulgating that which is good about medicine.

IMPAIRED PHYSICIAN'S HOTLINE - 301-467-4224

If you are the trustee of your own Pension or Profit-Sharing Plan you could be making a mistake.

The Pension Reform Act makes trustees personally liable for acts in violation of this statute. A trustee, for example, can be sued for mistakes in plan administration or for errors of judgment in investment management.

Let's face it. Physicians normally are simply too busy being physicians to devote the proper amount of time to their retirement plans. Congress obviously knew this, because one of the major purposes of the Pension Reform Act was to make the management of Pension and Profit-Sharing Plans the responsibility of competent professionals.

First National serves as trustee for a variety of retirement plans, including those of incorporated physicians.

So we ask: from one professional to another, doesn't it make good sense to let a professional perform what he does best?

Call Mr. James Neal at (301) 244-4607, for details.

Discipline Commission Action

Editor's Note: On instruction of the Council of the Medical and Chirurgical Faculty of the State of Maryland, "Findings of Fact, Conclusions of Law and Order" will be published in the JOURNAL.

IN THE MATTER OF AUGUSTIN DORDAI, MD, BEFORE THE
COMMISSION ON MEDICAL DISCIPLINE OF MARYLAND

Findings of Fact, Conclusions of Law and Order

Upon certain information coming to its attention, the Commission on Medical Discipline initiated an investigation into the obstetrical and gynecological practice of Augustin Dordai, MD, by the Peer Review Committee of the Baltimore County Medical Society. Thereafter, the Commission on Medical Discipline (the "Commission") determined to charge Respondent with certain violations of the Code. The violations charged involved the following sub-section of Article 43, §130(h):

(18) Professional incompetence.

Appropriate notice of the charge and the grounds from which it arose was given to the Respondent and a formal hearing on said charge was scheduled before the Commission on March 6, 1979 at 2 PM. In deference to the request of Respondent's attorney to proceed informally, the proceeding was changed to an informal hearing. The Respondent appeared represented by Harrison Stone, Esq. Stephen J. Sfekas, Assistant Attorney General, represented the Commission. Jack C. Tranter, Assistant Attorney General, advised the Commission on rules of evidence. Drs. Dixon and Ehrlich, as prospective monitoring physicians, also appeared.

At the time of said hearing, the Commission agreed to enter into the following Consent Order with the Respondent.

Findings of Fact

The Commission finds that:

1. The Respondent's hospital records reviewed for obstetrical and gynecological patients are unacceptable.
2. The Respondent's written evaluations of obstetrical patients are cursory and incomplete.
3. The Respondent has failed to perform necessary prenatal tests on some obstetrical patients.
4. The Respondent's use of oxytocic agents is not medically acceptable.
5. The Respondent's use of the classical Caesarean section rather than the low transverse section is not medically acceptable.
6. The Respondent failed to detect significant prenatal difficulties in his obstetrical patients.
7. The care Respondent has rendered on occasion to obstetrical patients is not medically indicated.
8. The Respondent has performed surgical procedures which are not medically indicated.
9. The obstetrical care of the Respondent rendered for Harshado Parekh and her sons, Miland B. Parekh and Mihir Parekh, deceased, is not medically acceptable.
10. The Respondent lacks sufficient medical knowledge and diagnostic skills for the type of independent medical practice in which he is currently engaged.
11. The Respondent cannot be permitted to continue the practice of medicine without close monitoring.

Conclusions of Law

Based on the foregoing Findings of Fact, this Commission accordingly adjudicates the Respondent guilty of the charge of professional incompetence.

Order

Upon the foregoing Findings of Fact and Conclusions of Law it is this 6th day of March, 1979, by the unanimous vote of the members of the Commission on Medical Discipline hearing this case

ORDERED that the Respondent is hereby Reprimanded and placed on probation subject to the following conditions:

1. That Respondent shall obtain, at least 100 hours of Category I Continuing Medical Education in the fields of obstetrics and gynecology in each year; and

Towson Plaza / (301) 296-2117

open monday through friday, 10 a.m. until 9 p.m.

open saturday 10 a.m. until 5:30 p.m.

2. That each of Respondent's obstetrical cases shall be reviewed prior to the time of delivery by the Chief of Obstetrics at the hospital at which the delivery is to be performed or by a physician designated by the Chief of Obstetrics and acceptable to the Commission provided that this provision shall not apply to patients in spontaneous labor with vertex presentation who were to have been delivered spontaneously, with or without low forceps.

3. That each of the Respondent's gynecological surgical admissions must be reviewed and, if necessary, the patient examined by the Chief of Gynecology at the hospital at which the surgery is to be performed or by a physician designated by the Chief and acceptable to the Commission, prior to the time of surgery in order to confirm the indications and need for surgery.

4. That the Respondent arrange with the Chiefs of Obstetrics and Gynecology at any hospitals at which he practices or may practice that the Chiefs or physicians designated by the Chiefs in accordance with paragraphs 2 and 3 above shall submit quarterly reports to the Commission concerning the Respondent's practice.

5. That the Respondent shall arrange for the Peer Review Committee of the Baltimore County Medical Society to review the Respondent's practice on a semi-annual basis and to submit a report on each such review of the Respondent's practice to the Commission; and be it further

ORDERED that if Respondent violates any of the foregoing Conditions of Probation, if a report submitted by the Peer Review Committee indicates that he is not practicing competently, or if a report submitted by the physician who observes his hospital-based surgery indicates that he is not performing competently, after notification and a hearing, the Commission may revoke the Respondent's license or impose any other disciplinary sanction it deems appropriate; and be it further

ORDERED that three years after the date of this Order, the Commission will entertain a petition to terminate Respondent's probationary status. At such time, if the Commission believes that complete reinstatement would not be appropriate, it may alternatively consider a request to modify one or more of the conditions of Respondent's probation; and

ORDERED that a copy of this Order be filed with the Board of Medical Examiners in accordance with the Maryland Code, Article 43, Section 130(m).

JOHN E. ADAMS, MD, Chairman
Commission on Medical Discipline

Consent

By this Consent, I hereby accept and submit to the foregoing Order and its conditions. Although I do not acknowledge that the Findings of Fact and Conclusions of Law upon which the Commission has based its Order are correct. I do acknowledge the validity of the Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, and to call witnesses in my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my rights to appeal any adverse ruling of the Commission that might have followed any such hearing. By this Consent, I waive all such rights and acknowledge that by my failure to abide by the conditions of my probation, I may suffer the revocation of my license to practice medicine in Maryland.

I sign this Consent without reservation, fully understanding its meaning and after consultation with my counsel.

AUGUSTIN DORDAI, MD

STATE OF MARYLAND, CITY OF Baltimore, to wit:
I HEREBY CERTIFY, that on this 6th day of March, 1979, before me, the subscriber, personally appeared AUGUSTIN DORDAI, MD, and he made oath in due form of law that the foregoing Consent is his voluntary act and deed.

AS WITNESS my hand and Notarial Seal.

ERLINE B. JOHANSEN

NOTARY PUBLIC

- The ability to acquire the latest in medical equipment

Call 539-0108 for all the details. It might be the most important move you make all day.

A subsidiary of
THE SAVINGS BANK OF BALTIMORE

Findings of Fact, Conclusions of Law and Order

Upon certain information coming to its attention and pursuant to Article 43, Section 130 of the Annotated Code of Maryland, the Peer Review Committee of the Medical and Chirurgical Faculty of Maryland initiated an investigation into the medical practice of the Respondent, Sing Eung Kim, MD with the assistance of the Allegheny County Medical Society and with the full assistance and cooperation of Dr. Kim. Thereafter, the Commission on Medical Discipline determined to charge Sing Eung Kim, MD with certain violations of the Code. The violations involve the following subsection of Article 43, Section 130(b):

(18) Professional incompetence.

Appropriate notice of the charges and the grounds from which they arose was given to the Respondent and a hearing on said charges was scheduled before the Commission on Sept. 27, 1977. The Respondent was unable to attend the meeting because of a serious illness, but his attorney, appeared on his behalf and made known Dr. Kim's willingness to enter into a consent order as proposed by the Commission.

Accordingly, the Commission finds that:

- (1) Dr. Kim is engaging in the practice of family medicine;
- (2) Dr. Kim's medical training is exclusively in the areas of pathology and otolaryngology;
- (3) Dr. Kim is not competent to engage in the practice of family medicine;
- (4) The Commission has received no indication that Dr. Kim is incompetent to practice pathology;
- (5) Dr. Kim is board certified in anatomical pathology and is board eligible in clinical pathology. Since the date of the aforesaid meeting, Dr. Kim has taken and passed the clinical pathology examination and is now Board certified.

Conclusions of Law

The Commission, therefore, concludes as a matter of law, that the Respondent was guilty of the charge of professional incompetence.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 10th day of February, 1978, by the unanimous vote of the members of the Commission on Medical Discipline hearing this case,

ORDERED, that effective February 10th, 1978, the license to practice medicine and surgery in the State of Maryland heretofore issued to the Respondent, Sing Eung Kim, MD, by the Board of Medical Examiners is hereby REVOKED; and be it further

ORDERED that the aforesaid revocation shall be STAYED on the following conditions:

1. That Dr. Kim shall cease the practice of family medicine 30 days from the effective date of this Order.
2. That Dr. Kim shall not resume the practice of family medicine unless and until he has completed, to the Commission's satisfaction, a residency program acceptable to the Commission, in family medicine or internal medicine.
3. That Dr. Kim continue to practice medicine as a pathologist provided that his practice may be reviewed by the Commission or its designee from time to time in the Commission's discretion.
4. That if Dr. Kim should decide to discontinue the practice of family medicine permanently and to confine his practice to pathology and shall give satisfactory assurances to the Commission of such a decision, that he may petition the Commission one year from the date of this Order to lift the revocation and to reinstate his license to practice medicine in the State of Maryland and be it further

ORDERED that a copy of this Order be filed with the Board of Medical Examiners of Maryland in accordance with the Maryland Code, Article 43, Section 130(m).

JOHN ADAMS, MD, Chairman

Consent

I ACKNOWLEDGE that I have determined to accept and submit to the above Order. By doing so, I acknowledge that I have waived my right to a full evidentiary hearing before the Commission, and accept the above Findings of Fact, Conclusions of Law and Order as if the same had resulted from a hearing at which I would have been able to

Cardinal Yacht Charters invites you to cruise the Caribbean in a manner that suits your style. IN THE MATTER OF ANSELMO ALLIEGRO, MD BEFORE THE COMMISSION ON MEDICAL DISCIPLINE

Findings of Fact, Conclusions of Law and Order

Upon certain information coming to its attention pursuant to the provisions of Article 43, Section 130 of the Annotated Code of Maryland, the Peer Review Committee of the Baltimore County Medical Association initiated an investigation into the medical practice of the Respondent, Anselmo Alliegro, MD. Thereafter, the Commission on Medical Discipline of Maryland, after considering the report and recommendation submitted by the Peer Review Committee, determined to charge the Respondent with certain violations of the Code. The violations charged involved the following subsection of Article 43, Section 130(h):

(18) Professional incompetence.

Appropriate notice of the charges and the grounds from which they arose was given to the Respondent and a hearing on said charges was scheduled to be held on September 5, 1978. Prior to the convening of that hearing, the Commission was contacted by M. Peter Moser, Esquire, the Respondent's counsel, with regard to the charges. Following discussions between Mr. Moser and Jack C. Tranter, Assistant Attorney General, counsel for the Commission, the Respondent agreed to plead guilty and to enter into a Consent Order as proposed by the Commission.

Findings of Fact

The Commission finds:

- 1. That the care rendered by Respondent for Ida M. Watts is not medically acceptable.
- 2. That the Respondent's medical records which were reviewed by representatives of the Peer Review Committee in February, 1978 were not then consistent with the standards required of a competent practitioner of internal medicine.
- 3. That a review of the Respondent's practice by the Peer Review Committee in August, 1978 indicates that the Respondent's record-keeping has significantly improved and that the Respondent's record-keeping is now acceptable.

Conclusions of Law

Based upon the foregoing Findings of Fact, the Commission concludes as a matter of law that the charge of professional incompetence has been substantiated and the Respondent is GUILTY of that charge.

Order

From the foregoing Findings of Fact and Conclusions of Law, it is, this 5th day of September, 1978, by the unanimous vote of seven members of the Commission on Medical Discipline

ORDERED, that the Respondent is hereby REPRIMANDED; and be it further

ORDERED that the Respondent is hereby placed on PROBATION for a period of three years based on the following conditions:

- 1. That the Respondent shall submit to continuing quarterly review of his practice by the Peer Review Committee of the Baltimore County Medical Association.

Greenspring In Beautiful Greenspring Valley

... a community where anything is possible so long as quality and imagination are paramount. The custom homes built here reflect the ambience one would expect in so fine a location.

We have the experience, the craft and the ability to make your dream a reality. Whether you allow us to suggest a design or work directly from yours, the result will be the ultimate expression of your own personality and life style.

Visit us and examine the 2 to 6 acre homesites in Maryland's most beautiful valley. GREENSPRING, is only minutes away from bustling Baltimore. The Beltway and Jones Falls Expressway are close enough to be convenient, far enough to be secluded.

Come and see the 2 to 6 acre homesites and make GREENSPRING your permanent address. Open daily 12-5 or by appointment.

Call Jim Hebb 301-825-6600 or 301-484-8018

Section II
Now Ready

From Baltimore Beltway North on Falls Road, left on Greenspring Valley Road, approximately 1-1/2 miles, opposite Villa Julie College.

TALK TO STEFFEY Realtors since 1915

2. That the Respondent shall request that the Peer Review Committee forward reports to the Commission following its review of the Respondent's practice.

3. That the reports submitted to the Commission by the Peer Review Committee shall indicate that Respondent is practicing medicine in a competent fashion and be it further

ORDERED that if the Respondent violates any of the foregoing conditions of probation, the Commission may charge Respondent with violations of Section 130h and notify him of the grounds therefor. If, following a hearing in accordance with Section 130, the charges are substantiated, the Commission may revoke or suspend the Respondent's license to practice medicine or further reprimand him subject to the provisions of Section 130 and be it further

ORDERED that one year after the date of this Order, the Commission will entertain a petition to terminate the Respondent's probationary status; and be it further

ORDERED that a copy of this order be filed with the Board of Medical Examiners of Maryland in accordance with Article 43, Section 130(m) of the Annotated Code of Maryland.

JOHN E. ADAMS, MD
Chairman

Consent

By this Consent, I hereby accept and submit to the foregoing Order and its conditions. I acknowledge the validity of the Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses in my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my rights to appeal from the within Order of the Commission. By this Consent, I waive all such rights and acknowledge that by my failure to abide by the conditions of my probation I may be charged with further violations of Section 130h and, if such charges are substantiated, suffer the revocation or suspension of my license to practice medicine in Maryland or be further reprimanded.

I sign this Consent without reservation, fully understanding its meaning and after consultation with my counsel.

ANSELMO ALLIEGRO, MD

STATE OF MARYLAND, CITY/COUNTY OF Baltimore: TO WIT:

I HEREBY CERTIFY that on this 5th day of September, 1978, before me, the subscriber, personally appeared ANSELMO ALLIEGRO, MD, and he made oath in due form of law that the foregoing Consent is his voluntary act and deed.

AS WITNESS my hand and Notarial Seal.

At its July 22, 1979 meeting, the Board of Directors approved the appointment of Leon G. Sheer, MD, to the Professional Relations Committee to finish the unexpired term of Robert E. Martin, MD.

Committee Reports

John Mulholland, MD, Chairman of the Public Relations Committee, presented his Committee's report and elaborated each of its many features. He announced that **Project Adoption** of the Primary Alcoholism Treatment (PAT) Center by BCMS was formalized and the agreement had been signed by President Albert M. Antlitz, MD. BCMS will be a facilitator of logistics with the PAT Program. Our Auxiliary will probably give much help. A Subcommittee on History of the Public Relations Committee is considering, with City government, elaborations of significant historical medical events with a Baltimore linkage. Being considered are, for instance, the sick bay on the **USS Constellation** with a display of health practices of the time, and also evolution of Med-Chi as an effort toward Continuing Medical Education for practicing physicians.

Progress on the Committee's exhibit for the Baltimore City Fair was reviewed. Problems of alcoholism and alcohol abuse will be featured. Breathalyzer tests will be available. It will emphasize that alcoholism is a **curable** disease.

Vincent Fitzpatrick, MD, representing the Public Health Committee, reported that the concept of having a women's physical fitness fair had mushroomed, under the stimulation of the City Health Department and the Mayor's Office, into a fitness/wellness fair for the entire community. The Directors agreed to this change and also voted to continue sponsorship of a program for high school coaches before the fall school sport season starts.

Lois Young, MD, reporting for the Professional Education Committee, brought a finalized version of her Committee's program topics for the coming year. Her list represents a distillation of the Committee's proposals and the Directors' editing over the year. Dr. Young indicated the Committee's discomfiture at being overridden and having to revise its scheduled programs more than once.

A Report from the Legislative Committee announced that meetings of the Directors, Committee Chairmen and interested Members with important Legislative leaders would be continued through the coming year at about monthly intervals. Whether BCMS should support the Health Round Table was deferred pending more information about its aims and financing.

Dr. Kassel Elected

A replacement is needed on the Med-Chi Council

for Carol Johns, MD, our representative, who has resigned to go to Wellesley. Leon Kassel, MD, was elected by the Directors from the eight members put in nomination.

Patricia Smith, MD, Chairman of the Health Care Delivery Committee, discussed its thorough and extensive evaluation of the Central Maryland Health Systems Agency's Plan dealing with allotment of hospital beds. Several influencing concepts emerged in the discussion. Dr. Smith noted that over the past several years, although her Committee's analytical comments have not effected any changes in plans that had already been finalized, some of her Committee's ideas have been included in the plans for the years that followed. Complexity of the methodology for determining the number of beds—excess or not—may be faulty. She pointed out, too, that a reduction of a small number of beds may not be cost-effective in that there is basic overhead that is independent of bed count.

Dr. Smith also called attention to the hamstringing aspect of the reimbursement process that must be changed before acute hospitals could also provide associated long-term care. This is not feasible now because of an HSCRC regulation that **ANYTHING** under the roof or aegis of a health care facility must be calculated in the total hospital costs. Separate accounting for endeavors less than acute care, and so less expensive, is not permitted, so, it is not economically possible for hospitals to have the less-costly long-term care wards, yet more long-term care beds are needed and could take beds not utilized for acute—and more costly—care—if the HSCRC permitted separate cost accounting according to need and use. □

In Memoriam: A. Austin Pearre, Jr., MD

Former Faculty President Dr. Albert Austin Pearre, Jr., a Frederick physician for more than half a century and member of the old state Board of Health, who was 80 years old, died in his sleep July 21, 1979 at his Frederick home.

During 1943-44, he was President of the Frederick County Medical Society. He was Vice President of the Medical and Chirurgical Faculty also in 1943, and 1950.

A graduate of Boy's High School in Frederick in 1915, Dr. Pearre received his Bachelor's and Medical Degrees at the Univeristy of Virginia.

He served as an intern in Baltimore at the University of Maryland, Church and John Hopkins Hospitals before taking his Residency at Union Memorial Hospital in 1924-25.

He then returned to Frederick to begin a practice that was uninterrupted until 1977, when he retired. In addition to his private practice, specializing in internal medicine and cardiology, Dr. Pearre was physician to Hood College for 40 years.

He also was physician to children and the aged at the Maryland Odd Fellows Home for many years, and to the Maryland School for the Deaf. From 1953-55, he was the Chief of Staff at Frederick Memorial Hospital.

Dr. Pearre was named to the State Board of Health in 1953 by then-Gov. Theodore R. McKeldin. From this forum, Dr. Pearre was among the first to label highway accidents as one of the nation's most serious health problems.

DR. PEARRE

In 1957, he recommended that the State Health Department focus its preventive medicine capabilities on highway deaths instead of such diseases as smallpox, which had ceased to pose a major threat to the public.

He helped organize the Frederick County Heart Association in 1953, and served as its President a decade later. He was a past Vice President of the Maryland Heart Association, which awarded him its Silver Service Recognition Medallion in 1965.

A Fellow of the American College of Physicians since 1928 and a Diplomate of the American Board of Internal Medicine, Dr. Pearre was a long-standing member of the American and Southern Medical Associations and of the Board of Maryland Blue Cross as well.

He was a member of the Frederick Rotary Club for more than 50 years and was the local President in 1940.

He was a member of All Saints Episcopal Church.

Survivors include his wife, the former Eleanor Gould; a son, Dr. A. Austin Pearre, Jr., of Frederick; two daughters, Mrs. William W. Abbot, of Charlottesville, VA and Mrs. Frank Lesure, of Frederick and eight grandchildren.

Speaking in the US Senate, Maryland Senator Charles MC Mathias, Jr. (R.) stated,

"Mrs. Mathias and I were saddened to learn of the death of Dr. A. Austin Pearre of Frederick. Dr. Pearre died peacefully in his sleep last night after a lifetime of service to his friends and neighbors in the community in which he was born and spent his whole life.

"Success" is a word that can be applied to almost every aspect of Dr. Pearre's career. He was chosen by his colleagues as President of the Frederick County Medical Association and later elected President of the Medical and Chirurgical Faculty of Maryland. He was never satisfied with his current level of knowledge and constantly enrolled in courses and programs that advanced his professional skill. 'Success' to a physician does not, however, depend on such material factors, but rather upon the relief he brings to people who suffer the pain and fear of illness.

"By this test, Dr. Pearre would be acclaimed an outstanding success by the thousands he helped restore to health, not only by treating their bodies, but by calming their fears and raising their confidence.

"Dr. Pearre took a long view of his profession. Many years ago, he commented to me that the previous century of medical research had been devoted to the fight against infection, but that the next century would concentrate on body chemistry. As the miracles of medical science have continued to unfold, they have underscored his insight and his accuracy, but with all the recognition that Dr. Pearre received in his profession and for all the advanced training he disciplined himself to absorb, I personally think nothing better can be said of him than that he was the ideal 'family doctor'.

"Our own family experience in benefiting from his skill and kindness is merely an example of many such relationships that made the community so dependent on him.

"When I was a child, my parents took me to see him

for the usual variety of childhood complaints. He was my grandmother's doctor. He helped my father through his last illness and came to his bedside at the time of his death. He continued to be my mother's doctor until his recent retirement and ever since has been on call for her when she needed him. He responded to the crisis in our own lives whenever Mrs. Mathias and I called upon him whether the occasion was childbirth of bee stings, and so I take this moment to bid farewell to Dr. Pearre and to express my appreciation not only for his work, but also for his example. His colleagues in the healing arts will do well to remember the standard of humane service rendered by Dr. A. Austin Pearre to the men, women and children with whom he shared his life.

"Mrs. Mathias and I want to express our sympathy to Mrs. Pearre and to the children and grandchildren who were Dr. Pearre's special pride and joy." □

Political Skills Workshop

Wednesday, Nov. 14, 1979

Holiday Inn — BWI

The Chairman and the Board of Directors are delighted to be able to offer to Maryland physicians and their spouses a political skills educational seminar. This was done two years ago with resounding success.

With the oncoming election next year, we must avail ourselves of every resource. AMPAC will provide knowledgeable speakers on each subject. A major topic will be "Practicing Medicine and Politics." Later in the afternoon, there will be a roundtable discussion with some of the Maryland Congressional delegation. They will explain health problems that are unique to their districts. There should be a lively verbal interchange. The afternoon begins at 1 PM and will be climaxed by cocktails and dinner.

The importance of your attendance cannot be too highly stressed. We need now, as always, to be both united and knowledgeable.

Nancy Lee Smoot

Data on file at The Upjohn Company

Motrin demonstrated statistically significant greater relief of pain than did Darvon at all time intervals.

Motrin 400^{TABLETS}mg
ibuprofen, Upjohn

- Not a narcotic • Not addictive • Not habit forming
- Rapid analgesic action • Indicated in acute and chronic pain
- Well tolerated. The most common side effect with Motrin is mild gastrointestinal disturbance.

Please turn the page for a brief summary of prescribing information.

Upjohn

Motrin® (ibuprofen)

now proved an effective analgesic for mild to moderate pain

Motrin® Tablets (ibuprofen, Upjohn)

Indications and Usage: Treatment of signs and symptoms of rheumatoid arthritis and osteoarthritis during acute flares and in long-term management. Safety and efficacy have not been established in Functional Class IV rheumatoid arthritis.

Relief of mild to moderate pain.

Contraindications: Individuals hypersensitive to it, or with the syndrome of nasal polyps, angioedema and bronchospastic reactivity to aspirin or other nonsteroidal anti-inflammatory agents (see WARNINGS).

Warnings: Anaphylactoid reactions have occurred in patients with aspirin hypersensitivity (see CONTRAINDICATIONS).

Peptic ulceration and gastrointestinal bleeding, sometimes severe, have been reported. Ulceration, perforation, and bleeding may end fatally. An association has not been established. Motrin should be given under close supervision to patients with a history of upper gastrointestinal tract disease, only after consulting ADVERSE REACTIONS.

In patients with active peptic ulcer and active rheumatoid arthritis, nonulcerogenic drugs, such as gold, should be tried. If Motrin must be given, the patient should be under close supervision for signs of ulcer perforation or gastrointestinal bleeding.

Precautions: Blurred and/or diminished vision, scotomata, and/or changes in color vision have been reported. If these develop, discontinue Motrin and the patient should have an ophthalmologic examination, including central visual fields.

Fluid retention and edema have been associated with Motrin; use with caution in patients with a history of cardiac decompensation.

Motrin can inhibit platelet aggregation and prolong bleeding time. Use with caution in persons with intrinsic coagulation defects and those on anticoagulant therapy.

Patients should report signs or symptoms of gastrointestinal ulceration or bleeding, blurred vision or other eye symptoms, skin rash, weight gain, or edema.

To avoid exacerbation of disease or adrenal insufficiency, patients on prolonged corticosteroid therapy should have therapy tapered slowly when Motrin is added.

Drug interactions. Aspirin: used concomitantly may decrease Motrin blood levels.

Coumarin: Bleeding has been reported in patients taking Motrin and coumarin.

Pregnancy and nursing mothers: Motrin should not be taken during pregnancy or by nursing mothers.

Adverse Reactions

Incidence greater than 1%

Gastrointestinal: The most frequent type of adverse reaction occurring with Motrin is gastrointestinal (4% to 16%). This includes nausea,* epigastric pain,* heartburn,* diarrhea, abdominal distress, nausea and vomiting, indigestion, constipation, abdominal cramps or pain, fullness of the GI tract (bloating and flatulence). **Central Nervous System:** Dizziness,* headache, nervousness. **Dermatologic:** Rash* (including maculopapular type), pruritus. **Special Senses:** Tinnitus. **Metabolic:** Decreased appetite, edema, fluid retention. Fluid retention generally responds promptly to drug discontinuation (see PRECAUTIONS).

*Incidence 3% to 9%.

Incidence less than 1 in 100

Gastrointestinal: Upper GI ulcer with bleeding and/or perforation, hemorrhage, melena.

Central Nervous System: Depression, insomnia. **Dermatologic:** Vesiculobullous eruptions, urticaria, erythema multiforme. **Cardiovascular:** Congestive heart failure in patients with marginal cardiac function, elevated blood pressure. **Special Senses:** Amblyopia (see PRECAUTIONS). **Hematologic:** Leukopenia, decreased hemoglobin and hematocrit.

Causal relationship unknown

Gastrointestinal: Hepatitis, jaundice, abnormal liver function. **Central Nervous System:** Paresthesias, hallucinations, dream abnormalities. **Dermatologic:** Alopecia, Stevens-Johnson syndrome. **Special Senses:** Conjunctivitis, diplopia, optic neuritis. **Hematologic:** Hemolytic anemia, thrombocytopenia, granulocytopenia, bleeding episodes. **Allergic:** Fever, serum sickness, lupus erythematosus syndrome. **Endocrine:** Gynecomastia, hypoglycemia. **Cardiovascular:** Arrhythmias. **Renal:** Decreased creatinine clearance, polyuria, azotemia.

Overdosage: In cases of acute overdosage, the stomach should be emptied. The drug is acidic and excreted in the urine, so alkaline diuresis may be beneficial.

Dosage and Administration: Rheumatoid and osteoarthritis, including flares of chronic disease: Suggested dosage is 300, 400 or 600 mg t.i.d. or q.i.d.

Mild to moderate pain: 400 mg every 4 to 6 hours as necessary for relief of pain.

Do not exceed 2400 mg per day.

Caution: Federal law prohibits dispensing without prescription.

For additional product information, see your Upjohn representative or consult the package insert.

Dr. Guyther *Good Housekeeping's* Family Doctor of the Year

Prominent Med-Chi member J. Roy Guyther, MD, a Maryland physician, was honored at the White House July 18th by First Lady Rosalynn Carter as this year's "Family Doctor of the Year."

Dr. Guyther, 59, who has two children and one grandchild, was received by Mrs. Carter in the Oval Office of the White House. In attendance were six members of Dr. Guyther's family and Dr. W. Jack Stelmach of Kansas City, President of the American Academy of Family Physicians. The AAFP, the national association of family doctors, cosponsors the award with **Good Housekeeping** Magazine, which was represented by Margaret Adams, Senior Editor of national affairs.

Chosen from numerous nominees from AAFP chapters across the country, Dr. Guyther is the third physician to receive the annual **Good Housekeeping** "Family Doctor of the Year" award.

In his letter (full text follows) nominating Dr.

Guyther for the award, C. Earl Hill, MD, President of the Maryland Academy of Family Physicians, described his colleague as: "Gentleman, humanitarian, healer, academician and scholar—this is the theme of Dr. Guyther's life."

A native of and family physician in Mechanicsville, MD, Dr. Guyther was described by Dr. Hill as a "spokesman" for his community, and a "most respected practitioner . . . sought out for advice and counsel by his county, his state, by national organizations and by the Federal government regarding health care."

As a family doctor, Dr. Hill added, "Buck' Guyther assumed total health care responsibility for all the people of his community. He delivered their babies; he cared for the infants and children, the young adults, their family problems and he made a tremendous contribution providing community leadership to make his community a better, happier and healthier place for his patients to live."

A graduate of the University of Maryland School of Medicine in 1943, Dr. Guyther returned to his alma mater in 1972 to serve as an Associate Professor in the University's Department of Family Health. His tenure there, according to Dr. Hill, "Has gained him a reputation among all medical students and residents of real credibility, because he is an ideal, true teaching role model."

A founder of the Family Practice Medical Students' Club, which he still supervises, and the University's Family Practice Department, Dr. Guyther returned to private practice in Mechanicsville in 1973.

Since beginning practice as a family doctor in 1948, Dr. Guyther has delivered more than 1,500 babies.

Good Housekeeping Magazine's new "Family Doctor of the Year" also has served as a Captain in the US Army Medical Corps. He has been President of the Maryland Chapter of the American Academy of Family Physicians and has served as a Delegate from the state to the AAFP Congress of Delegates.

Dr. Pillsbury's Mailgram

"J. Roy Guyther MD
Mechanicsville, MD 20659.

On behalf of your many colleagues and friends in the Faculty, may I express our sincere congratulations on your being named Physician of the Year. Your concern and devotion to patients, as well as your interest in the delivery of high quality medical care, are well-known within the profession. Your selection for this award now brings to public attention your worthiness and outstanding attributes as a family physician and friend.

WILLIAM A. PILLSBURY MD, President
Medical and Chirurgical Faculty of the
State of Maryland."

Dr. Hill's Letter of Nomination

"Boyd E. McCracken, MD, Chairman
Public Relations Committee
American Academy of Family Physicians
1740 W. 92nd St.
Kansas City, MO 64114.

Dear Dr. McCracken:

The Maryland Academy of Family Physicians submits with pride the nomination of J. Roy Guyther, MD for the 1979 **Good Housekeeping** "Family Doctor of the Year" Award. This nomination is submitted with the complete approval of the entire membership of the Maryland Academy, its Board of Directors and myself, as President and spokesman of the Maryland Academy of Family Physicians.

In your Memorandum of Jan. 5, 1979 requesting nominations, you provided the following quotation as "a guideline for selection:"

"...the Committee will consider all nominations by state chapters; however, because the individual... selected (will) be the subject of national publicity, the committee recommends that nominees... reflect the best characteristics of the family physician, that they... be dynamic, energetic and active members who practice within the precepts of 'care with caring' for the entire family and... demonstrate proficiency in the variety of disciplines of family practice."

Our chapter gave this directive our immediate attention and by means of a rather extensive survey, the name that came up overwhelmingly was that of Dr. J. Roy Guyther of Mechanicsville, MD; however, we had one problem, and that was that your guidelines for nominations paragraph in no way covered the qualities that our candidate has demonstrated. We would like to

paint for you a word picture of the achievements of Dr. Roy "Buck" Guyther.

Born in the small, rural farming community where he learned to live closely with the problems of daily farm community living, he aspired from the onset to be a "family doctor." He received all of his pre-medical, medical and graduate training in the University of Maryland Medical Education System, where he laid the groundwork for his extensive knowledge of medical education and the health care system of Maryland. This was to be an important background for his future activities on behalf of the medical care of the people of Maryland.

Immediately, on completion of his graduate training, Dr. Guyther returned to his home community where he, as a general practitioner, assumed total health care responsibility for all the people of his community. He delivered their babies; he cared for the infants and children; the young adults, the pre-elderly and the elderly. He cared for their injuries, their surgery, their worries, their family problems and he made a tremendous contribution by providing community leadership to make his community a better, happier and healthier place for his patients to live. Because he understood the ways of his people, he became their spokesman, advocate and confidante. He gained a respect from the community and its leadership which made possible the creation of even better conditions for the people of his community.

His concerns for the future of his community, and the wonderful example he set, attracted other family physicians and specialists.

In the early 1950s, Dr. Guyther recognized that the general practitioner of that day needed to be a part of an organized representation. He became a member of the American Academy of General Practice, and was instrumental in the founding of the Maryland Chapter.

From this point on, Dr. Guyther, as a most respected

J. Roy Guyther, MD: "Family Doctor of the Year" Honored at the White House:

Mrs. Rosalynn Carter, representing the President, greeted Dr. J. Roy Guyther of Mechanicsville, MD, July 18th in Washington, DC, on the occasion of Dr. Guyther being chosen *Good Housekeeping's* "Family Doctor of the Year," an award given annually by the magazine in conjunction with the American Academy of Family Physicians. From the left are Mr. and Mrs. Joseph R. Guyther, Jr.; the First Lady; Dr. Guyther; Diedre Elizabeth Logan; Mrs. J. Roy Guyther; Mrs. Kathryn G. Logan, and Academy President W. Jack Stelmach. (Photo from AAFP Reporter, Kansas City, MO.)

practitioner providing the full gamut of general practice in a small community, was sought out for advice and counsel by his county, his state, by national organizations and by the Federal government regarding health care. These requests were for advice, to formulate policies, to propose laws and regulations and to participate in important health care studies.

He was one of the earliest physicians to recommend that the status of the "general practitioner" of the future must be elevated by training, prestige and reward, and, therefore, he was actively involved in the support and establishment of the new specialty of Family Practice. He was most influential in persuading the then practicing general practitioners to recognize that what was important was the future family physician and that this future family physician's quality, training and prestige needed to be enhanced. This was just another example of one of Dr. Guyther's outstanding characteristics, in that while he works hard and effectively in the present, he is always looking ahead to the future of the family physician.

Gentleman, humanitarian, healer, academician and scholar—this is the theme of Dr. Guyther's life.

Dr. Guyther was a charter member of the St. Vincent de Paul Society when it was founded in 1952. During the 27 years since its inception, Roy has provided help to the poor and those struck by sudden tragedy. This has been done by providing food, shelter, clothing and financial assistance in quick response to need. His intimate knowledge of the problems of those living in his community has been and continues to be invaluable. In the work of the St. Vincent de Paul Society, families with homes ravaged by fire, husbands suffering from unexpected unemployment, farmers feeling the anguish of a disappointing harvest and the young and old living in the isolation of the chronically ill, have all been touched by his work. Dr. Guyther has given this help for over a quarter of a century freely, consistently, compassionately and without public recognition.

St. Mary's County was the first county in Southern Maryland to have a first-rate nursing home. Dr. Guyther spearheaded these efforts and has served as Medical Director of the St. Mary's Nursing Home since it was established in 1965. During this time, it has proved to be an excellent health care facility. Many bed-bound patients whose families could not care for them at home have had their health restored at the Nursing Home to a degree that has permitted them to live as an independent family member once more. Many old and incurably-ill patients have died with dignity there. St. Mary's Nursing Home is a most valued facility in St. Mary's County and Dr. Guyther's efforts, more than any other individual, have made it so.

He is a physician who, in the time of need for teachers in the discipline of Family Practice, left his practice to return to his alma mater to give others the benefit of practice experience. This would become one of the oldest medical school Departments of Family Medicine. At the University, he demonstrated his skill as a teacher. His scholarly and academic approach, but, most of all, his practice background gained him the reputation from all medical students and residents of real credibility, because he was an ideal, true teaching role model. This phase began in 1967—two years before

the specialty of Family Practice was founded. He was also instrumental in founding the country's first Family Practice Medical Students' Club, which he still supervises. When his University's Family Practice Department was well established, he returned to his practice.

There is another outstanding contribution of Dr. Guyther that requires special attention. This has been his special ability to bring together the older general practitioners who were the time-honored traditional practice foundation, with the current medical students, residents in training and new family physicians. Since 1952, in his State Chapter, and since 1963 as a Delegate in the House of Delegates of the American Academy of Family Physicians, he has over and over again been able to have each of these groups appreciate the values of the other, so that they came out working for the common good of the future of family practice. In the evolution of family practice as a new discipline, his ability to bring the old and the new together has been most fundamentally responsible for the advancement of family practice. Many a time in the House of Delegates it was Dr. Guyther's reassuring common sense that calmed serious potential diverse situations. The respect that he has gained as a 16-year Delegate in the House has brought many of the Academy leaders to seek his advice and counsel.

Dr. Edward J. Kowalewski, a Past President of the American Academy of General Practice, and currently the Chairman of the Department of Family Medicine at the University of Maryland, has probably best identified Dr. Guyther's contributions as follows:

'The strength of accomplishment of J. Roy Guyther emanates from the fact that he is a complete family physician who is doing his job daily for his patients and his community. He epitomizes the true family physician role model that the people of our country holds in such high esteem. He is an example of the spirit and service that must be preserved if family practice is to continue its respected position.

Many family physicians have contributed much to their communities, but not many have had the dedication, ability, talent, personality and willingness to translate their deep-rooted foundations of the principles of general practice into the teaching of the family physician of the future. In my opinion, a very large part of the success of the family practice movement to date and the measure of progress for the future must be attributed to just a limited few who can project such a true role model to trainees. Dr. Guyther is the most effective contributor I have seen in this role.

I must make one more important comment about Dr. Guyther from my position as Chairman of a University Department of Family Medicine. Those of use who are Chairmen fully recognize that we could make very little progress without the support and encouragement, advice and guidance of respected behind-the-scenes worker who is always there to give that important support so frequently needed.

I would like to summarize my feelings about Dr. Guyther by saying with all the conviction and sincerity I can muster that Family Medicine, clinically and academically, is where it is today in our state because of the efforts of Dr. J. Roy Guyther. Because of this, he should receive all of the recognition he truly deserves.'

The citizens of St. Mary's County and of Mechanicsville are most eager to honor their "family doctor," Dr. J. Roy Guyther. They have provided all sorts of documentation and testimonials in support of his nomination for the "Doctor of the Year" award. They are prepared individually and collectively to appear before any forum to attest to his value to their community.

The Maryland Academy of Family Physicians is therefore most pleased to certify all of the accomplishments of Dr. J. Roy Guyther mentioned above, and is therefore proud to nominate him for this most prestigious award. We also feel that Dr. Guyther's achievements are unique in that they not only include the traditional complete family practice service accomplishments, but also important teaching and scholarly activities that have been most exemplary and most outstanding.

As President of the Maryland Academy of Family Physicians, I am prepared to provide any additional documentation that you may require in support of our candidate.

C. EARL HILL, MD

President
Maryland Academy of Family Physicians

Curriculum Vitae: Joseph Roy Guyther, MD

Born

July 31, 1920
Mechanicsville, MD

Residence

Rt. 3, Box 272
Mechanicsville, MD 20659
Telephone: (301) 884-3148

Lions Club of Mechanicsville — Past President
Knights of Columbus
Member — Welfare Board of St. Mary's County
St. Vincent de Paul Society
Immaculate Conception Conference

Practice Narrative

J. Roy Guyther, MD began private solo practice on Jan. 1, 1948 in Mechanicsville, MD, population 250, as one of eight practicing physicians in the whole of St. Mary's County (population 35,000). Because one of the physicians in the county was impaired and four were over 70 years of age, the area was medically underserved and Dr. Guyther became dedicated to encouraging additional physicians to locate in St. Mary's. After seven years of solo activity, he added a series of associates in his practice. A total of five young physicians and one dentist were provided office space. Indirectly, with equipment and financial inducements to begin medical practice, he was responsible for two surgeons establishing practices in the area. At the same time, he became involved in the same activity of recruiting physicians on a statewide basis.

Dr. Guyther became actively involved in the establishment of a nursing home for St. Mary's County. After four years as Chairman of a planning committee and two years of advice on construction, the St. Mary's Nursing Home was completed and Dr. Guyther has served as Medical Director since its dedication in 1966.

During his years of medical practice, Dr. Guyther has delivered approximately 1,500 babies. This service has extended into the second generation, i.e., delivering mothers whom he had delivered.

Dr. Guyther has regularly made house calls since beginning medical practice in 1948. He continues to provide this service on every working day.

Dr. Guyther has spent thousands of hours in the past 30 years on committees involved in medical and civic affairs on the state and local levels.

Medical Attitudes of the Amish

By J. Roy Guyther, MD, ABFP

For reprint and other data, write Dr. Guyther at Rt. 3, Box 272, Mechanicsville, MD 20659.

The Amish are a conservative Christian group in North America who are primarily members of the Old Order Amish Mennonite Church. The religious sect originated in Europe by way of a schism in The Mennonite Church in Switzerland, Alsace and South Germany. Jakob Ammann, the leader of the church group, taught that members should dress in a uniform manner, that beards should not be trimmed and advocated the practice of shunning those who violate the precepts of the faith.

The Amish began migrating to North America around 1720 and first settled in eastern Pennsylvania. At present, there are groups in approximately 20 states. The Old Order Amish are best-known for their severely plain clothes, and non-conformist way of life. This cultural non-conformity is considered by the Amish to be based on Biblical strictures, but it also represents a continuance of 17th Century European rural customs. The Amish shun telephones, electricity and drive horses and buggies rather than automobiles. They cultivate the land without the use of modern farm implements. There are an estimated 60-70,000 Amish in the United States.

Because marriages with non-Amish are strictly forbidden and because their mobility is limited, there is a high degree of consanguinity in the group. Their closed society, together with their limited number of ancestors, has maintained a population which in turn has proved to be a valuable source for human genetic studies.

Thirty years of medical practice in a community with a large Amish population has provided an opportunity to analyze certain characteristic attitudes which these hard-working, frugal people exhibit.

The individuals in the Amish sect say they are no different than the average person; However, their strong religious beliefs and their nonconforming life-style made this contention difficult to support. They do have a strong faith in the will of God. Because of this they do not subscribe readily to the concept of insurance, as this suggests that should things go badly there is a hedging of the risk, or entering into a transaction that will protect against loss and thus a willful interference with the divine plan. Somehow such an action might indicate a lack of faith that things will go well for those who deserve it. Reticence about the insurance concept has caused troubles to the Amish with regard to Social Security payments. At least one Amish farmer had his horses seized for failure to pay Social Security taxes. The Amish do not buy life insurance, and they do not buy hospital and medical insurance such as Blue Cross and Blue Shield. This is perceived as betting against the odds of becoming ill and needing hospitalization or expensive physician fees. The community comes to the aid of the hardship cases who have unusual medical expenses beyond their ability to pay, hence the pressure

is off the individual to provide for an unforeseen catastrophe.

As a group, the Amish have a higher birthrate than the average in the US with the typical couple having seven children. Though they appreciate the need for good medical care, they often seek ways to avoid high costs. The lack of hospital insurance has prompted many to seek obstetrical care from midwives and to favor home deliveries partly as a cost-saving action and also because they recognize that modern hospital practice intrudes into family life. Now that modern medical practice has virtually eliminated the granny midwife, the Amish are turning to nurse midwives for home delivery. They are willing to accept the added risks for the sake of economy and personal satisfaction.

Out-of-hospital deliveries may seem fiscally sound, but there is a definite sacrifice of safety. There are statistics available from a number of states substantiating the fact that there are significantly more still births and other perinatal mortality from out-of-hospital deliveries when compared to in-hospital. Therefore, because of economic factors and because of a feeling that modern medical technology applied at the time of delivery is interference with the family, the Amish expose themselves to a higher risk of perinatal complications than is ideal.

The Amish have not yet accepted the philosophy of preventive medicine. Their medical care is episodic i.e., when a problem presents itself, medical advice or service is sought, but it is very unlikely that any Amish, be he farmer or bishop of the community, would present himself at his physician's office for an annual physical. This philosophy carries over into other preventive medicine measures. Very few of the children in the group in Maryland receive routine immunizations. Only after an outbreak of whooping cough could the family physician prevail upon the Amish to have their children immunized against this serious childhood infection. There is no religious prohibition against immunization procedures. Since the public health authorities will provide immunizations at no cost, there are no economic barriers. The reasons for not seeking this protection could only lie in tradition or in the concept that immunizations are similar to insurance. It is perceived that one may be lacking in the faith that God will protect, and consequently is hedging his bet that the child will not contract a serious communicable disease.

There is a very slowly developing trend for young married couples to accept immunizations of their children. An unusual case of vaccine-associated poliomyelitis has set back this trend in the Southern Maryland Amish Community. The low level of naturally occurring immunity among the unvaccinated in this closed community resulted in paralytic polio in a young mother who was a contact with four infants who received oral trivalent polio vaccine.

Case Report

A previously well 27-year-old woman from an

Amish community in Southern Maryland complained of pain in her right shoulder. The patient thought she had injured her shoulder in helping with tobacco farming and consulted a chiropractor in a neighboring town. When the patient was seen by a local physician approximately one week after onset of her symptoms, she complained of weakness, headache and continued pain in the right shoulder.

Examination revealed oral temperature of 38°. There was no skin rash. She exhibited the classic tripod sign when attempting to sit up on the examining table. There was resistance to flexion of her neck, but frank nuchal rigidity was absent. There was motor weakness of the right upper extremity with absent sensory signs. The remainder of the physical examination was not significant except that the patient was approximately 15 weeks pregnant. Lumbar puncture revealed 118 w.b.c., 97% lymphocytes, 1% monocytes, 2% polymorphonuclear leukocytes. White blood count 6,200 with a normal differential. Electrolytes, renal function and liver function were normal.

There had been documented exposure to several small children who had recently received trivalent oral polio vaccine. A stool culture yielded poliovirus, type 3, vaccine-like antigenically with a positive temperature marker at 39.9 C.

One year after onset, the patient continues to have weakness that has resulted in impaired function of her right arm. She delivered at term of a healthy female child.

Twenty one persons, most of whom were associated with the case of poliomyelitis, submitted sera to be screened for the presence of antibody against poliovirus; 14% were immune to Type I, 86% to Type II and 67% immune to Type III.

The above data, the documented exposure of the patient's children and the patient to recent vaccines and the antigenic and temperature characteristics of the isolate support the hypothesis that this was a case of community contact vaccine associated poliomyelitis.

Since this case occurred, the other parents in the Amish community have been more resistant to routine immunization of their children.

There is one further characteristic of the Amish that has been observed, but is difficult to document. There is an inclination for these people to seek the services of medical cultists such as naturopaths, chiropractors and other unorthodox healers. The desire for personal attention, and the satisfaction achieved from a healer by physical manipulation may well be the underlying basis for this propensity of turning to non-medical practitioners. Religious persecution which the Amish were subjected to in Europe may well have created a somewhat distrustful feeling toward the matter-of-fact, scientific approach of modern medicine.

How do these medical attitudes of the Amish affect their health? First, the lack of medical insurance tends to cause the individual to delay medical attention until a problem becomes urgent.

The failure of the Amish to seek preventive medicine measures likewise tends to delay care for some illnesses. This is true not only of primary preventive measures such as immunizations, but secondary meas-

ures which might assist in early detection of disease and also tertiary prevention, which aids in minimizing physical damage produced by disease processes. The Amish definitely tend to seek episodic care for their medical problems, rather than continuing care. In other words, when they feel well they feel no need for a physician; when they feel ill, they seek medical services.

The added risk of out-of-hospital deliveries has previously been alluded to. The decisions for this type service are based on the feeling that modern medical hospital technology interferes with family life. Individual families make their own decisions, but the pervasive burden of cost influences these decisions.

The perception that the Amish as a group are inclined to seek non-medical practitioners for relief of their ills has not influenced their overall health, morbidity or mortality. The natural course and outcome of many diseases is not always determined by medical intervention. If the failure to obtain quality medical care were the only determining factor in outcome of disease, the Christian Science sect would have been decimated years ago. The human organism has a self-corrective ability, and sophisticated medical care offers only the extra 10-15% chance of improving the overall outcome of ill-health.

Preventive Medicine In Family Practice

A Mini-Conference For the Family Physician Sponsored by the Maryland Conference of Family Practice Resident, the Maryland Academy of Family Physicians and the Department of Family Practice of Franklin Square Hospital.

Saturday, Oct. 27, 1979, 10 AM to 4 PM at Franklin Square Hospital Baltimore, MD

Participating Faculty

Steven Mohlie, MD

Program Chairman and Resident Member,
Board of Directors, Maryland Academy of Family Physicians.

William Reichel, MD

Chairman, Department of Family Practice
Franklin Square Hospital

W. Michael Gould, MD

Chief, Division of Dermatology
Franklin Square Hospital

Harrold T. Elberfeld, MD

Associate Director Department of Obstetrics and
Gynecology
Franklin Square Hospital

Lawrence Blumberg, MD

Attending Physician, Section of Orthopedics
Franklin Square Hospital

Ann K. Stearns, PhD

Behavioral Scientist,
Department of Family Practice,
Franklin Square Hospital

Thomas M. Holcomb, MD

Chairman, Department of Pediatrics
Franklin Square Hospital

Henry J. Mark, ScD

Behavioral Scientist,
Department of Family Practice
Franklin Square Hospital

It is also acceptable for five hours of prescribed credit by the American Academy of Family Physicians.

Conference Program

Preventive Medicine in Family Practice

This Mini-Conference is designed to provide five hours of practical and relevant information for the family physician. A question and answer period is included in each discussion.

9:55 AM Welcome

Steven Mohlie, MD
William Reichel, MD

10 AM Prevention and Treatment of Age-Related Skin Disorders

W. Michael Gould, MD

10:30 AM Treatment of Abnormal Pap Smear

Harrold T. Elberfeld, MD

11:15 AM Prevention of Sports Injuries

Lawrence Blumberg, MD

Noon Luncheon — Informal discussion

1 PM The Grieving Patient (Preventive Aspects)

Ann K. Stearns, PhD
Panel of Family Physicians

2 PM Preventive Medicine for Infants and Children

Thomas M. Holcomb, MD

3 PM Learning Disabilities (Preventive Aspects)

Henry J. Mark, ScD

Registration Information

This Mini-Conference is acceptable for five hours of Category I credit under the Physician's Recognition Award of the American Medical Association.

Enrollment is limited to the first 90 registrants.

Except for a \$4.50 luncheon fee, there is no charge for this Mini-Conference.

Fat Embolus

By TIMOTHY A. LAMPHIER, MD.

For reprint and other data, contact the author at 117 Aliso Dr., Palm Springs, CA 92262.

Fat Embolism is one of the most serious complications of trauma and it bears a strong similarity to such complications as congestive atelectasis, respiratory distress syndrome and shock lung. Automobile accidents resulting in multiple long bone fractures have made Emergency Room physicians and surgical consultants more cognizant of this condition with its attendant mortality and morbidity. Fractures with fat emboli will run mortality rates as high as 5% in fractures of the tibia, 10% for femoral fractures, and 20% for combined fractures of both the femur and tibia.¹

Fat Embolism occurs in 1 or 2% of all patients with fractured femur or tibia shafts and of this group the death rate will be 20 or 30%.²

Such conditions as extensive injuries to soft tissues (without fractures), Sick Cell Anemia, Diabetes, acute hemorrhagic pancreatitis and chronic alcoholism can also be accompanied by fat embolism.

Pathophysiology

The source of fat emboli consist mostly of neutral fat. Fat cells ruptured by trauma release fat droplets which enter the venous drainage at the local sites of injury. These droplets are trapped as emboli in the lung filters having passed through pulmonary arteries. It is the systemic fat emboli that are responsible for fat found in urine and possibly is the basis for formation of characteristic petechiae. Also, biologically active substances, such as plasmakinins, may reach the systemic circulation from injury sites.

It is a medical fact that particulate matter released into the venous circulation produces signs and symptoms of acute "Cor Pulmonale" by raising pressure in the pulmonary arterial system and right atrium. Vasoactive amines released from lung parenchyma cells

produces vasospasm and airway constriction. The lungs normally contain large numbers of platelets.

In addition to the lung containing large numbers of platelets, there is always clumping (or aggregation) of platelets following trauma. Droplets of fat become coated with a thin layer of platelets in their passage to the lung or after their arrival in the lung. Large numbers of platelets will then sequester and break down in the lung releasing a humeral factor, especially Serotonin via platelet amines. The release of 5-HYDROXYTRYPTAMINE (5-HT) causes broncho-constriction and pulmonary venous constriction and ultimately passive congestion of the pulmonary capillary bed. The pulmonary alveolar surfaces are composed of Type 1 pneumocytes and occasional Type 2 pneumocytes. The functions of the Type 1 pneumocytes are not well understood except that they are involved in the clearing mechanism of the lung. However, the Type 2 pneumocytes produce lung surfactant which lines the alveoli as an extra cellular layer of fluid of phospholipid material lying on top of a base of protein material. Plasma colloid osmotic pressure and lung surfactant oppose the movement of fluids from capillaries into alveoli.

These pneumocytes promote hydrolysis of neutral fat droplets to glycerol and free fatty acids. Free fatty acids from systemic depots are produced secondary to the release of catecholamines. Trioleic and Oleic acid cause an immediate loss of surfactant material and subsequent thickening and marked vesiculation of the alveolar and capillary wall. Hemorrhage, edema and atelectasis result with characteristically severe arterial hypoxia occurring.

Symptoms

Clinical Features: The characteristic triad of symptoms are:

- | | |
|--------------|---------|
| a. Pulmonary | } Triad |
| b. Cerebral | |
| c. Petechiae | |

A. Pulmonary:

1. Respiratory distress.
2. Tachypnea with rales (30/min. or higher).
3. Hemoptysis.

4. Diffuse rhonchi and rales.

5. ??? Pleural friction rubs.

B. Cerebral (Prognosis is poor)

1. Mental confusion
2. Comatose
3. Drowsiness
4. Restlessness
5. Obstreperousness
6. Cerebral Ischemia
7. Headaches
8. Apprehension
9. Stupor
10. Convulsions
11. Cortical Blindness
12. Hemiballismus

C. Petechiae in axillae, chest, root of neck, subconjunctival areas and soft palate occur on the second or third day and are present in over 80% of patients.

Diagnosis

A. Carry out on a daily basis, the following **three tests for the presence of fat**:

1. **Urine** — (the urine is positive for fat³ in 50% of cases).
 - a. Collect 24 hour specimens of urine in a grease-free collecting flask.
 - b. To 15 cc. of urine in a centrifuge add five drops of oil red stain or Sudan iii or Sudan iv (Sizzle Test of Scuderi).
 - c. Chill for one hour.
 - d. Centrifuge up to 2000 rpm for five min.
 - e. With Capillary pipette or wire loop, transfer sample from very top of supernate to free-fat microscope slide.
 - f. In Nembauer chamber obtain count of red stain bodies — (neutral fat appears as irregular masses of bright red material).
 - g. As a control, run known negative urine and a saline solution made positive by the addition of some bone marrow.
2. **Blood** — Venous from injured extremity or via Swan-Ganz Catheter.
 - a. Centrifuge 10 cc. of venous blood in EDTA at 3,000 rpm for 15 minutes.
 - b. Using white cell pipette, draw very top

of plasma to mark 1, then oil red stain — (2 gm. oil red powder, 50 cc. acetone, 50 cc. 30% alcohol, 1 cc. concentrated acetic acid) — to mark two.

- c. Shake pipette for five minutes.
- d. Wipe two Neubauer counting chambers with Xylene, fill and let stand for two minutes.
- e. Count red-stained globules in all nine squares of both chambers.
- f. To calculate fat particles per cubic millimeter multiply total count by 10 and divide by 1.8.

3. Sputum

- a. Prepare thick sputum smear with wire loop on degreased microscope slide.
- b. Stain for neutral fat according to standard AFIP technique.
- c. Examine under microscope for microscopic fat globules — "They are extracellular and are 10-40 μ in diameter."

4. **Serial Thoracic Roetgenogram** daily (using original as baseline, check for diffuse infiltration or snow storm-like appearance). (These are **positive in only a small percentage** of cases).

5. **Daily Fundoscopic Examination** (for intravascular fat) and also hemorrhage in vitreous.

6. Daily Laboratory:

- a. Hematocrit and hemoglobin (watch for sudden drop).
- b. Prothrombin.
- c. Platelet count (thrombocytopenia occurs).
- d. Serum calcium (may be decreased due to interaction of calcium and fatty acids).
- e. Urinalysis (free fat in 50%).
- f. BCP₁₆
- g. Serum lipase (rises on third-fifth post-injury day).

- h. Cross match and keep in reserve four units of whole blood.
- 7. **Serum Haptoglobin**
- 8. **Daily Vectorcardiograms** is the best method of detecting cardiac abnormalities accompanying fat embolism. **Check for:**
 - a. Right Heart Strain.
 - b. Tachycardia.
 - c. Arrhythmias (Sudden appearance of prominent "S" waves in lead I).
 - d. Prominent Q waves in lead two.
 - e. Inversion of T waves.
 - f. Shift of transient zone to the left.
 - g. Depression RST segments.
 - h. Right Bundle Branch Block.

Treatment

1. Monitor four times daily arterial blood gases for at least three days for hypoxia.
 - a. pO_2 , pCO_2 , and pH may be low.
 - b. Cryostat frozen section of blood in every case that paO_2 is less than 60 mm. of mercury. Keep paO_2 at 70 mm. Hg.
 - c. Earliest parameter to respond is pO_2 (12-24 hours).
 - d. The objective is to maintain the arterial pO_2 between 60-80 mm. Hg.
 - e. When an arterial pO_2 of more than 60 mm. Hg. cannot be maintained by the administration of 40% oxygen in a tent, intubation or tracheostomy should be carried out. Volume respirator is much more satisfactory.
2. Monitor the following: Temperature, Pulse, respiration and blood pressure every four hours. (Frequently temperature is over 102 degrees F. and cardiac rate is 115-130).
3. Maintain CVP (Central Venous Pressure). Never allow over 20-25 cm. H_2O .
4. Oxygen and aminophyllin for wheezing (oxygen mask 10-15 liters per minute with humidity). A volume respirator is superior to a pressure respirator. Keep pO_2 between 60-80 millimeters of mercury. Arterial pO_2 never over 100 mm. Hg. because O_2 then becomes toxic.
5. Positive and expiratory pressure (PEEP) is required to improve the respiratory status of the patient.
 - a. Once the adult respiratory distress syndrome occurs, the only treatment that has been shown to be effective is mechanical ventilation with positive end expiratory pressure.
 - b. PEEP should be instituted if an arterial pO_2 of greater than 75 mm. Hg. cannot be maintained with an inspired oxygen concentration of less than 50%.
6. Tracheostomy with positive-pressure Ventilator.
 - a. Following intubation and placement of the patient on a volume cycled respirator, measurements of cardiopulmonary dynamics are performed.
 - b. Early and repeated measurements of the arterial blood gases and pH have become the cornerstone of both the diagnosis and the management of patients with fat embolism.
7. Morphine grains 1/8 or 1/4 for restlessness, pulmonary hypertension and prior to bronchoscopy.
8. Digitalis for right ventricular failure (Cor Pulmonale).
9. Alcohol intravenously: ... (Controversial)
 - a. 1000 cc of 5% dextrose with 5% ethanol solution intravenously every 12 hours for three-five days.
- b. Also ethanol orally for the first four to five days. (Ethanol is a vasodilator, lipase inhibitor and ??? detergent.
10. Heparin 20-50 mg. every six-eight hours (it is Lipolytic and prevents aggregation of platelets). ... (Controversial treatment).
11. Steroids:
 - a. 125 mg. of Solu-Medrol intravenously stat.
 - b. 100 mg. every four hours for three days. (Or Solu-Cortef 600-1,200 mg. in 24 hours). (Reduces edema and diapedesis of red blood cells in lungs).
12. Biopsy petechiae for intravascular fat. (Petechiae secondary to thrombocytopenia).
13. Routine treatment of shock if present with IV fluids, etc., starting with Ringer's Lactate.
14. Glucose prevents fat embolization:
 - a. Fifty milliliters of 50% glucose solution is injected intravenously during a one to two minute period on a four hour schedule for three consecutive days.
 - b. The hypertonic glucose therapy produces a decrease in serum cholesterol, triglycerides, total lipids and free fatty acids.
15. Dextran "40" - 500 cc. intravenously every 12 hours (to reduce aggregation of red blood cells).
16. Preventative program to offset GI bleeding.
 - a. Milk
 - b. Antacids
 - c. Anticholinergics
 - d. Cimetidine
17. If indwelling catheter to monitor urinary output is desired, use a three-way Foley with Neosporin GU Irrigant.
18. Atromid-S (Clofibrate) tabs 1 t.i.d. (to reduce blood lipids and reduce adhesiveness of platelets).
19. IPPB every three hours

with 80% oxygen and 30% ethyl alcohol.

20. Diuretics - 50 mg. Edacrin I.V.
21. Aminophylline - 250 mg. - IV (**Slowly**).

•

The following table represents a possible pathogenesis of respiratory distress following Fat Embolism

Fracture
Fat Emboli
Lungs
Pneumocytes
Time Lag
Fat
Free Fatty Acids
Lipase
Endothelial Damage
Pulmonary Congestion
Decreased Pulmonary Compliance
Hypoxia-Acidosis

Dr. Robert E. Dutton of Albany Medical School recently reported great success using a Swan-Ganz Catheter for sampling the pulmonary microcirculation and extracting and staining macroglubules of fat it may contain.

"If fat is found, these patients are placed on mechanical ventilatory support before a high shunt and high V_D/V_T develop. If fat emboli escape through arteriovenous shunts into the systemic circulation, peripheral capillaries in the brain, skin, and kidneys may be occluded."⁴

Summary

There has been presented a description of the pathophysiology and importance of the immediate recognition of fat embolism. Once diagnosed properly, only 70% survive. The Triad of symptoms are outlined. Most important is proper treatment of pulmonary pathology and pulmonary distress. The severity of the condition is related directly to the duration and degree of hypovolemia and shock. A Systolic Blood Pressure of less than 100 mm. of mercury (Hypotension) and a cardiac rate greater than 120 per minute often doubles the mortality rate.

Criteria for the Laboratory

Diagnosis of Fat Embolism: (Helpful in pinpointing the clinical entity).

1. Lipuria—Lipemia
2. Elevation of the serum lipase.
3. Chest X-ray
4. Electrocardiogram
5. Thrombocytopenia
6. Decreased arterial pO_2 .

Serving the Health Care Industry
for more than 50 years.

IT'S HIGHLY RECOMMENDED... AND FOR GOOD REASONS

1. provides broad-spectrum, overlapping antibacterial effectiveness against common susceptible pathogens, including staph and strep
2. helps prevent topical infections, and treats those that have already started
3. it's good medicine for abrasions, lacerations, open wounds, primary pyodermas, secondarily infected dermatoses; and it's painless and cosmetically pleasing
4. contains three antibiotics that are rarely used systemically, so the risk of sensitization is minimal
5. you can recommend it in any of the three convenient package sizes: 1 oz tube, 1/2 oz tube, or the versatile, single-use foil packet

NEOSPORIN® Ointment

(polymyxin B-bacitracin-neomycin)

Each gram contains: Aerosporin® (Polymyxin B Sulfate) 5,000 units, bacitracin zinc 400 units, neomycin sulfate 5 mg (equivalent to 3.5 mg neomycin base); special white petrolatum qs; in tubes of 1 oz and 1/2 oz and 1/32 oz (approx.) foil packets.

WARNING: Because of the potential hazard of nephrotoxicity and ototoxicity due to neomycin, care should be exercised when using this product in treating extensive burns, trophic ulceration and other extensive conditions where absorption of neomycin is possible. In burns where more than 20 percent of the body surface is affected, especially if the patient has impaired renal function or is receiving other aminoglycoside antibiotics concurrently, not more than one application a day is recommended.

When using neomycin-containing products to control secondary infection in the chronic dermatoses, it should be borne in mind that the skin is more liable to become sensitized to many substances, including neomycin. The manifestation of sensitization to neomycin is usually a low grade reddening with swelling, dry scaling and itching; it may be manifest simply as a failure to heal. During long-term use of neomycin-containing products, periodic examination for such signs is advisable and the patient should be told to discontinue the product if they are observed. These symptoms regress quickly on withdrawing the medication. Neomycin-containing applications should be avoided for that patient thereafter.

PRECAUTIONS: As with other antibacterial preparations,

prolonged use may result in overgrowth of nonsusceptible organisms, including fungi. Appropriate measures should be taken if this occurs.

ADVERSE REACTIONS: Neomycin is a not uncommon cutaneous sensitizer. Articles in the current literature indicate an increase in the prevalence of persons allergic to neomycin. Ototoxicity and nephrotoxicity have been reported (see Warning section).

The Role of the Speech Pathologist in Treating the Dysphonic Patient

By LINDA E. SPENCER, PhD

Dr. Spencer is Assistant Professor of Speech Pathology in the Department of Speech at Baltimore's Loyola College, where she can be contacted for reprint and other data.

Introduction

"The majority of voice disorders are the result of **abuse** and **misuse** of the vocal mechanism."¹ These disorders include such pathologic entities as vocal nodules, polyps, contact ulcer and granuloma, polypoid degeneration, as well as reddening, thickening and bowing of the folds. Frequently, successful treatment of the voice-disordered patient requires the close interaction of the laryngologist and the speech pathologist to prevent the recurrence of the original lesion and to promote improved vocal use. The purpose of this article is to describe vocal abuse as a causative agent in dysphonia and to acquaint the reader with techniques used by speech pathologists to restore vocal function.

Understanding Vocal Abuse

It is important to understand that there are many sources of vocal abuse. Perhaps most obvious is the screaming and yelling characteristic of preadolescent boys while playing competitive games. Among factory workers, noisy workplaces encourage elevated speaking levels, while adding mechanical or chemical irritation to the vocal folds from airborne dust or other agents. Business and professional people who rely on their voices for their livelihoods are susceptible to vocal abuse as well. Stress associated with a high need to achieve, which is characteristic of many of these people, underlies some of the voice problems which they experience. Careful listening suggests that many successful businessmen use high levels of muscular tension in the laryngeal area to produce a highly controlled, authoritative-sounding voice. Almost invariably, they report that they never speak above a normal conversational intensity.

Tissue changes which occur with vocal hyperfunction are usually accompanied by perceptible alterations in the vocal tone which are easily recognized by the experienced clinician. Some voice changes have etiologic significance, while others reflect the extent of the lesion. Disorders of voicing which should be recognized include the following:

1. Vocal roughness corresponds to hoarseness or harshness. The degree of roughness is closely related to the size of a space-occupying lesion located on the vocal folds, although it can be readily imitated by someone with a normal larynx.²
2. Pitch breaks are abrupt involuntary shifts of the voice to higher or lower pitches and may suggest the degree to which fine control of the internal tension of the vocal folds has been lost.
3. Phonation breaks are abrupt, involuntary cessations of phonation, due perhaps to the interfer-

ence of a lesion, or simply to an inefficient habitual mode of phonation.

4. Inappropriately low pitch is heard more often than high pitch. It can have etiologic significance, as when it is used habitually by those who wish to sound more authoritative. In addition, increased mass of the vocal folds, as when they are edematous, may lower the pitch of the voice.
5. Glottal shock is an abrupt form of vocal initiation which gives emphasis to words beginning with vowels. Used excessively, especially in conjunction with laryngeal tension or pitch lowering, it can be extremely abusive.

These alterations in the vocal tone are usually accompanied by such subjective feelings as discomfort, tightness or pain in the laryngeal area, a feeling of a foreign body being in the laryngeal or sublaryngeal area, loss of speaking intensity toward the end of the day, and loss of the upper pitches in the singing range. Frequently, the patient is more concerned about the throat discomfort than the vocal quality change.

Management

The goal of effective management of the dysphonic patient is to restore the voice to normal function if at all possible. The first step is to establish baseline data documenting the physiologic and perceptual state of the vocal mechanism. This is accomplished during the initial evaluations by the laryngologist and the speech pathologist. The initial medical evaluation of the larynx documents the appearance, size and location of any lesion before intervention has been initiated. Photographing the vocal folds can be valuable for this purpose.

The initial evaluation by the speech pathologist will include a history of the voice disorder, an analysis of current vocal use and abuse, as well as a description of the voice quality and respiratory pattern. In addition, most clinicians will obtain objective measures of vocal function, such as maximum phonation time, pitch range, habitual pitch and estimated optimal pitch. From these, specific goals for subsequent therapeutic intervention will be formulated.

For patients whose abusive habits have generated a space-occupying lesion on the vocal fold, therapy may commence either prior to or following surgery. Presurgical intervention may promote healing of tissues inflamed by continuing abuse. In addition, the patient is less likely to return to abusive modes of phonation after he/she is taken off vocal rest following surgery. Continuation of therapy after healing is complete will assist the patient in transferring the new vocal skills to all speaking situations. For the patient who has experienced deteriorating vocal quality with little or no ap-

preciable development of a space-occupying lesion, prompt vocal rehabilitation may circumvent the need for surgery.

The speech pathologist uses a variety of techniques to establish improved vocal tone. These methods are used either singly or in combination, depending on the needs and abilities of the patient. Below are some common techniques, along with comments regarding their implementation.

1. Initially, the clinician analyzes the patient's typical voice use to obtain a complete list, in order of importance, of each source of abuse. This process may extend over several weeks as the patient's awareness of his/her voice grows. Those factors which are found to be contributing significantly to the current state of the voice are eliminated or replaced by more desirable behaviors. For example, the patient may be unaware of habitual coughing or throat-clearing. Once it has been brought to the patient's attention, it can be reduced and, finally, eliminated.
2. Altering voice pitch is especially desirable for those who have artificially lowered the pitch of the voice. (As a note of interest, these people frequently complain of pain in the laryngeal area and often are found to have changes in the mucosa of the posterior third of the vocal fold, such as contact ulcer.) Pitch is elevated with the patient matching tones from a piano or pitch pipe until both patient and clinician are satisfied that laryngeal tone is clearer and speaking effort is reduced. Frequently, a lessening of laryngeal pain is noted after the patient begins using the new pitch habitually.
3. Deep muscle relaxation is of great benefit to patients who show abnormally high muscle tension in the laryngeal area. The patient is taught to contract, then relax specific muscle groups, noting the feelings imparted to those muscles. Over time, the patient learns to recognize and eliminate abnormal muscle tension outside the therapy setting. Voluntary relaxation of the laryngeal muscles greatly reduces tension in this area and promotes improved laryngeal tone. Contracting and relaxing of muscles may be accompanied by stretching and massaging extrinsic laryngeal muscles. The patient is taught to tilt the head toward the chest, then toward each shoulder, feeling the resulting pull on the muscles of the neck. Massage of these muscles may be added to promote greater relaxation.
4. In a state of relaxation, the patient is shown how to emit an audible sigh, beginning at a high pitch and dropping smoothly to a normal speaking pitch. Frequently, vocal quality is better in the higher portion of the pitch range and can be utilized as a model to be imitated at a more appropriate pitch.

These constitute just a few of the techniques used by speech pathologists to reduce laryngeal hyperfunction and improve vocal quality. The reader will note that voice rest was not included. Voice rest generally is not

regarded as a therapy technique per se, since the patient usually resumes his abusive vocal practices as soon as voice rest is terminated.¹ The laryngologist frequently uses voice rest in the case of severe laryngitis, or following laryngeal surgery, however, to promote tissue healing.

Summary

Effective treatment of the dysphonic patient who is a vocal abuser frequently requires the joint efforts of medical and speech practitioners. Both must understand the etiologic significance of vocal abuse in producing a variety of pathologic changes in the vocal folds, as well as the resulting perceptual changes in vocal quality. Referral of the patient for vocal rehabilitation may be made before or after surgical removal of the space-occupying lesion to aid the patient in achieving a more normal mode of phonation.

**When painful spasm
is the presenting
symptom...**

...in the functional bowel/irritable bowel syndrome*

Bentyl[®]

(dicyclomine hydrochloride USP)

10 mg. capsules, 20 mg. tablets,
10 mg./5 ml. syrup, 10 mg./ml. injection

helps control abnormal motor activity
with minimal anticholinergic side effects†

Demonstrated smooth muscle relaxant activity.

In this double-blind study, twenty patients having G.I. series and exhibiting spasm were randomly selected to receive either 2 cc. of Bentyl or sodium chloride intramuscularly. Ten minutes after the injection another radiograph was taken . . .

. . . Bentyl produced definite relaxation in 8 of 10 patients. The sodium chloride produced relaxation in only 3 of 10. No side effects occurred in either group of patients.

Pylorospasm has almost totally blocked passage of barium meal.

Barium meal beginning to pass 10 minutes after intramuscular injection of 20 mg. Bentyl.

"The correlation of spasm relief and drug given was excellent."

*This drug has been classified "probably" effective in treating functional bowel/irritable bowel syndrome.

†See Warnings, Precautions and Adverse Reactions.

See following page for prescribing information.

Merrell

B-4420 (Y736A) MNR-804

Bentyl® (dicyclomine hydrochloride USP)

Capsules, Tablets, Syrup, Injection

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATIONS

Based on a review of this drug by the National Academy of Sciences-National Research Council and/or other information, FDA has classified the following indications as "probably" effective:

For the treatment of functional bowel/irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

THESE FUNCTIONAL DISORDERS ARE OFTEN RELIEVED BY VARYING COMBINATIONS OF SEDATIVE, REASSURANCE, PHYSICIAN INTEREST, AMELIORATION OF ENVIRONMENTAL FACTORS.

For use in the treatment of infant colic (syrup).

Final classification of the less-than-effective indications requires further investigation.

CONTRAINDICATIONS: Obstructive uropathy (for example, bladder neck obstruction due to prostatic hypertrophy); obstructive disease of the gastrointestinal tract (as in achalasia, pyloroduodenal stenosis); paralytic ileus, intestinal atony of the elderly or debilitated patient; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; myasthenia gravis. **WARNINGS:** In the presence of a high environmental temperature, heat prostration can occur with drug use (fever and heat stroke due to decreased sweating). Diarrhea may be an early symptom of incomplete intestinal obstruction, especially in patients with ileostomy or colostomy. In this instance treatment with this drug would be inappropriate and possibly harmful. Bentyl may produce drowsiness or blurred vision. In this event, the patient should be warned not to engage in activities requiring mental alertness such as operating a motor vehicle or other machinery or perform hazardous work while taking this drug. **PRECAUTIONS:** Although studies have failed to demonstrate adverse effects of dicyclomine hydrochloride in glaucoma or in patients with prostatic hypertrophy, it should be prescribed with caution in patients known to have or suspected of having glaucoma or prostatic hypertrophy. Use with caution in patients with: Autonomic neuropathy. Hepatic or renal disease. Ulcerative colitis. Large doses may suppress intestinal motility to the point of producing a paralytic ileus and the use of this drug may precipitate or aggravate the serious complication of toxic megacolon. Hyperthyroidism, coronary heart disease, congestive heart failure, cardiac arrhythmias, and hypertension. Hiatal hernia associated with reflux esophagitis since anticholinergic drugs may aggravate this condition.

Do not rely on the use of the drug in the presence of complication of biliary tract disease. Investigate any tachycardia before giving anticholinergic (atropine-like) drugs since they may increase the heart rate. With overdosage, a curare-like action may occur. **ADVERSE REACTIONS:** Anticholinergics/antispasmodics produce certain effects which may be physiologic or toxic depending upon the individual patient's response. The physician must delineate these. Adverse reactions may include xerostomia; urinary hesitancy and retention; blurred vision and tachycardia; palpitations; mydriasis; cycloplegia; increased ocular tension; loss of taste; headache; nervousness; drowsiness; weakness; dizziness; insomnia; nausea; vomiting; impotence; suppression of lactation; constipation; bloated feeling; severe allergic reaction or drug idiosyncrasies including anaphylaxis; urticaria and other dermal manifestations; some degree of mental confusion and/or excitement, especially in elderly persons; and decreased sweating. With the injectable form there may be a temporary sensation of lightheadedness and occasionally local irritation. **DOSAGE AND ADMINISTRATION:** Dosage must be adjusted to individual patient's needs.

Usual Dosage: Bentyl 10 mg. capsule and syrup: *Adults:* 1 or 2 capsules or teaspoonfuls syrup three or four times daily. *Children:* 1 capsule or teaspoonful syrup three or four times daily. *Infants:* ½ teaspoonful syrup three or four times daily. (May be diluted with equal volume of water.) Bentyl 20 mg.: *Adults:* 1 tablet three or four times daily. Bentyl Injection: *Adults:* 2 ml. (20 mg.) every four to six hours intramuscularly only. **NOT FOR INTRAVENOUS USE.** **MANAGEMENT OF OVERDOSE:** The signs and symptoms of overdose are headache, nausea, vomiting, blurred vision, dilated pupils, hot, dry skin, dizziness, dryness of the mouth, difficulty in swallowing, CNS stimulation. Treatment should consist of gastric lavage, emetics, and activated charcoal. Barbiturates may be used either orally or intramuscularly for sedation but they should not be used if Bentyl with Phenobarbital has been ingested. If indicated, parenteral cholinergic agents such as Urecholine® (bethanechol chloride USP) should be used.

Product Information as of October, 1978.

Officers Elected

The following are elected officers of the Maryland Society of Otolaryngology for 1979-80: President: **Dr. Haskins Kashima**; Secretary Treasurer: **N. Edward Nachlas, MD**; Executive Committee: **Dr. George Alderman** and **Dr. Cyrus Blanchard**, all of Baltimore.

American Heart Association Presents Award to Dr. Chris Papadopoulos

Dr. Chris Papadopoulos, Chief of Staff and Chief of Cardiology at South Baltimore General Hospital, was recently the recipient of the Gold Distinguished Service Award of the American Heart Association—Central Maryland Chapter. This is awarded for long and distinguished leadership and unusually excellent contributions to the Chapter. Dr. Papadopoulos, an Assistant Professor at the University of Maryland School of Medicine, has been Past President of the Central Maryland and the State Heart Associations. This is the first time ever that this award has been presented.

DR. PAPADOPOULOS

Solomon Snyder Receives International Psychiatric Prize

Solomon H. Snyder, MD, Distinguished Service Professor of Pharmacology and Psychiatry at the Johns Hopkins School of Medicine, received the Anna Monika Foundation Prize at a meeting of the World Psychiatric Association in St. Moritz August 30th. The \$10,000 First Prize is awarded for outstanding biological psychiatric research.

Dr. Snyder and his colleagues are well-known for their discoveries of opiate receptors in the brain and of enkaphalins, the normally-occurring, morphine-like substances which act upon the opiate receptors. Dr. Snyder shared the 1978 Lasker Award for basic medical research for this work, which was hailed as fundamental to solving the major human problems of the relief of pain and narcotic addiction.

The techniques Dr. Snyder developed to identify the opiate receptors have enabled him and others to monitor receptors for most of the neurotransmitters, or chemical messengers, in the brain. His discovery of the receptors for the neurotransmitter dopamine was followed by his demonstration that antischizophrenic drugs exert their therapeutic effects by blocking dopamine receptors. This, in turn, has led to his development of a blood test which permits monitoring of the effectiveness of such drugs.

The awards committee of the Anna Monika Foundation includes the major professors of psychiatry of European universities; chairman of the committee is Professor P. Kielholz, head of psychiatry at the University of Basle, Switzerland.

Dr. Johnson Appointed

John L. Green, Vice President for Operations/Administrator of Lutheran Hospital of Maryland, Inc., has announced the appointment of **Dr. Sandra Owens Johnson** as Medical Director of the Rosemont Community Doctors' Center.

Dr. Johnson received her MD from the University of Florida

School of Medicine, located in Gainesville. She interned and took her residency at the University of Maryland Hospital and the Baltimore Veterans Administration Hospital. Her background includes specific concentration in outpatient care, both emergency and non-emergency. She served as Assistant Director of emergency room services at University Hospital also.

Commenting on her new position, Dr. Johnson says: "My goal is to provide primary health care at the community level and to educate patients in the area of preventive medicine. If people do not understand their health problems, then the practice of poor health habits and the subsequent patterns of illness usually repeat themselves."

According to Dr. Johnson, "Emphasis on preventive medicine is an inherent part of the care provided at the Rosemont Community Doctors' Center. Patients are encouraged to schedule appointments with the same Center physician, resulting in continuity of care and the establishment of traditional patient-physician relationships."

One of the first primary care practices to be established on a hospital campus, the Rosemont Community Doctors' Center is lo-

cated at 800 Braddish Ave. in Baltimore, and is open from 8:30 AM-5 PM on Tuesdays, Thursdays and Fridays and from 8:30 AM-8 PM on Mondays and Wednesdays.

Opened a little more than a year ago, the Doctors' Center was funded through a \$500,000 grant award from the Robert Wood Johnson Foundation. □

OUR ONLY BUSINESS

"EVERYTHING FOR THE WOODBURNING PUBLIC"

OUR PROFESSIONAL SALES STAFF
RALPH BAUMGARDNER, MARY MCGREGOR, PAUL WILLIAMS

When you consider energy costs today, it's easy to understand why thousands of Maryland homeowners have turned to Fisher® Woodstoves. Fisher Stoves can save up to 75% on your heating bills and will burn 18 to 24 hours on one fueling of coal or wood. Fisher Stoves are firebrick lined, guaranteed for five years, virtually airtight and have patented Spin Draft Air Controls. These features make Fisher the highest quality, American-made woodstove.

At BAUMGARDNERS', you can choose from sixteen models and ten eye pleasing colors of Fisher® Woodstoves in both Stove and Fireplace models. The new Fireplace Insert model can make your existing fireplace ten times more efficient. We can answer any questions you may have regarding heating with wood. Keep in mind that we also sell fitted Glass Fireplace Doors, Chimney systems, fireplace toolsets and more... everything you need for your fireplace or woodstove to warm and beautify your home.

Fisher® Stoves - An idea America is warming up to.

Drug Alert!

The following advance advisory notice to all practicing physicians from the Surgeon General of the Public Health Service, Dr. Julius Richmond, regarding the possible dangers of prescribing certain drugs to individuals who abuse alcohol, has been received. You may have already received this notice in your mail, but in case you have not, we bring it to your attention because we believe the message is urgent.

SIDNEY B. SEIDMAN, MD
Chairman, Committee on Drugs

Recent events have highlighted the importance of physicians and health professionals giving greater attention to possible dangers of prescribing certain drugs to individuals who abuse alcohol. During the past several years, there has been a major increase in this country in the medical and non-medical use of drugs. Concurrently, the wide use of alcohol by both men and women enhances the probability that alcohol and another drug will act simultaneously in many individuals, with serious and potentially-fatal consequences. Indeed, alcohol use in combination with other drugs accounts for approximately 20% of the total number of accidental and suicidal deaths per year which are drug-related.

Concern over these trends prompts me to alert the medical profession to the special problems of prescribing certain drugs for patients who consume alcohol.

I wish to remind all physicians and health professionals that:

Many commonly-prescribed drugs have altered therapeutic and/or adverse medical effects when taken with alcohol. These drugs

include not only sedatives, hypnotics, narcotics, antidepressants and tranquilizers, but also certain antihistamines, analgesics, anti-coagulants and anti-infective agents.

Minor tranquilizers as well as other CNS depressants are frequently used by patients in combination with alcohol despite warnings to the contrary. This combined use may produce adverse medical consequences. Moreover, the resultant potentiation of CNS depression can impair performance of tasks requiring alertness—such as driving—increasing the likelihood of injury and even death. The combination itself can lead to death by accidental overdose or by suicide.

The use of marijuana and other illicit psychoactive substances is widespread, and this use often occurs in combination with alcohol, or other licit psychoactive drugs.

Therefore, I urge all physicians and health professionals to:

1) Routinely document the history and scrutinize the pattern of alcohol consumption for individual patients to determine the possible relationship between presenting complaints and mixing drugs with alcohol;

2) Be alert to the possible interaction of prescribed, over-the-counter, or illicit drugs—singly or in combination—with alcohol;

3) Pay careful attention to the section in the package insert that deals with drug-alcohol interactions and consult the current medical literature and references for specific problems;

4) Limit as much as is practical the quantity of drugs dispensed with any one prescription and monitor the patient with regular follow-ups for unexpected reactions to the medication and

5) Consider, both in the choice of therapy and in the evaluation of the patient, the likelihood of the patient's adherence to your admonition (and that of warning label on the prescription) against using alcohol while taking medication.

Attempted Rh Immune Prophylaxis After Massive Transfusion: A Case Report

By N. Mallya, MD; P.R. Sohmer, MD; R.B. Dawson, MD, FCAP and R.A. Cowley, MD

This article is from the Blood Transfusion Laboratories of the Department of Pathology and Maryland Institute of Emergency Medicine of the University of Maryland School of Medicine and Hospital at Baltimore, MD. Dr. Mallya is a staff Pathologist at Provident Hospital in Baltimore. Formerly, he was Assistant Medical Director of the Blood Bank and Transfusion Service of the University of Maryland Hospital. Dr. Sohmer is Acting Medical Director of the Blood Bank and Transfusion Service of the University of Maryland Hospital and Research Associate of the Blood Research Laboratory of the Department of Pathology of the University of Maryland School of Medicine, Baltimore. Dr. Dawson is Professor of Pathology and Associate Professor of Medicine at the University of Maryland School of Medicine and Director of the Blood Transfusion Laboratories of the University of Maryland Hospital, as well as Director of the Blood Research Laboratory of the Department of Pathology and Director of the Baltimore Rh Typing Laboratory. Dr. Cowley is Director of the Maryland Institute of Emergency Medicine and Professor of Surgery at the University of Maryland School of Medicine. For reprint and other data, contact Dr. Sohmer at the Blood Transfusion Laboratories of the University of Maryland Hospital, 22 S. Greene St., Balto., MD 21201.

Introduction

The literature contains relatively little information regarding patients treated with Rh-immune globulin for Rh-immune prophylaxis subsequent to transfusion of large volumes of Rh positive blood. In the present case report, after infusion of Rh positive erythrocytes in a life-threatening emergency, a large volume of Rh immune globulin was administered.

Case Report

A 17-year-old, white female was brought to the Maryland Institute of Emergency Medicine by helicopter from the scene of a motor vehicle accident on March 11, 1978. The patient suffered multiple facial abrasions, a comminuted fracture of the right femur and pelvic fractures. Insertion of a foley catheter revealed gross hematuria. A small, lower abdominal midline incision revealed gross hemorrhage within the peritoneal cavity. A precipitous fall in hematocrit necessitated infusion of three units of uncrossmatched group O, Rh positive concentrated red cells. Simultaneous serological testing revealed a recipient blood group and type of group O, Rh₀ negative, D^u negative. Splenectomy and exploratory laparotomy were performed. The patient was successfully resuscitated; and subsequently appropriate orthopedic and plastic surgery procedures were carried out without further complication.

Sixty-six hours after the infusion of Rh positive blood, 7,500 ug. of human anti-Rh immune globulin were begun and administered in divided doses over a 36-hour period without complication.

The patient has been followed with direct and indirect antiglobulin testing since administration of Rh immune globulin. At 24 and 72 hours post-therapy, the indirect antiglobulin test was positive to titers of 1:512. At six months following therapy, titers remained positive at 1:8.

Discussion

Although Rh immune prophylaxis with Rh immune globulin has proven effective after abortion, live birth and ectopic pregnancy, only isolated success has been reported after Rh incompatible blood transfusion.^{1,2} Three questions are paramount to appropriate therapy: 1) Time at which therapy must commence? 2) Dosage? and; 3) Percent incidence of non-response?

By convention, Rh immune globulin is administered within 72 hours after exposure; however, the basis for this schedule raises the question of whether administration at 96 or 120 hours would prevent sensitization. In the transfusion setting, therapy probably should be started with minimal delay.

Previous therapy failures may have occurred due to inadequate dosage of Rh immune globulin. Therefore, according to Pollack et al,³ a dosage of 20 ug./cc. packed cells is required. In those patients in whom successful immune prophylaxis after transfusion has been achieved, such a dosage was used.^{1,2} However, Pollack has suggested that a total dosage of 2,000 ug. may be effective against any volume of transfusion.⁴ Bowman et al² have suggested that with transfusion of 1,000 ml. or more Rh positive cells, partial exchange transfusion may be performed to reduce the number of circulating Rh positive cells.

From studies performed on human volunteers, Pollack et al^{4,5} have demonstrated a response rate of 68-82% in Rh negative individuals receiving 500 cc. of Rh positive blood. The patient may be a non-responder. This must be taken into consideration. In addition, some have suggested that transitory immune paralysis may occur following massive transfusion, thus preventing antibody synthesis.

In the present patient, antibody titers are positive at six months post therapy. Since the half-life of Rh immune globulin is 30 days, this may indicate presumptive sensitization and failure of Rh-immune prophylaxis.

How NOT to be Sued for Malpractice

By JEAN-MAURICE POITRAS, MD

For reprint and other data, write Dr. Poitras at 107 Edgerton Rd., Towson, MD 21204.

William Smellie (1697-1763), the great English obstetrician of the 18th Century, was immortalized because of his great work **The Theory and Practice of Midwifery**, originally published in three volumes, which came out at different periods. The first volume containing the **Principles and Practice of Midwifery**, was dated 1752, but was actually released in the latter part of 1751. Volumes Two and Three were published respectively in 1754 and 1764, the latter one year after his death. These latter two volumes are taken up with 530 case histories and their clinical observations. There were repeated editions and translations into many languages.

The following case is taken from Volume III of Smellie's great work. The case is reproduced in its entirety and, on reading, no further explanation is needed for the above title to this historical note.

Cases in Midwifery—Page 506, Number 3—Case 1

Several years ago, I delivered a woman in May Fair, of a small child. In turning and delivering it, by the feet, I found the bones of one of the arms snap asunder; a circumstance which surprised me the more, as I never turned and delivered a child with greater ease, or in a slower or more cautious manner. Indeed, I am persuaded it happened principally from the smallness of the bone. I said nothing, but wrapped the child up in its blanket, and laid it on the lap of one of the assistants, desiring her not to move it, till I had got the woman put right in bed. I then examined the arm, and told the nurse that it was a little hurt in the delivery, but would soon recover. As the child was poor of muscular flesh, I only applied a compress dipped in brandy and water, and with a single roller kept the ends of the bones together, which I found was sufficient at the time, and to prevent suspicion of a fracture, I held the arm during the dressing. I desired the nurse not to let it lie on that side, and not to undress the body of the child till I was present. As I visited my patient every day, I had the opportunity of renewing the dressings as there was occasion, and the arm recovered without the parents having any other suspicion than of a strain in the delivery.

*Editor's Note: What worked for Dr. Smellie in 1750 in England may not work in 1979 in the United States. If there was negligence in the delivery of the infant, failure to so inform the parents might be considered a fraudulent concealment and would toll the statute of limitations from running. ("Toll" is a legal term meaning to **stop** or to **hold in obedience**.) Even in the absence of fraud, the statute might be tolled until the parents discovered the negligence. If there was not negligence in the delivery (the bone broke is a result of a nonnegligent complication of the procedure) then Dr. Smellie would have little grounds on which to fear a malpractice suit (at least in 1750 in England)!*

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

SYMPOSIUM ON GYNECOLOGIC ONCOLOGY DECEMBER 7 & 8, 1979

THE INTERNATIONAL HOTEL
Baltimore, Maryland

Sponsored by the
Gynecology Oncology Program
Department of Obstetrics and Gynecology
and the
Department of Radiotherapy
and the
Program of Continuing Education
University of Maryland - School of Medicine

This symposium on gynecologic oncology is designed to help gynecologists, radiation therapists, oncologists and primary care physicians become aware of some of the new developments in the diagnosis and treatment of pre-malignant and malignant lesions of the female genital system.

Generics save money. Big money!

The FTC estimates that \$400 million could be saved annually on the nation's Rx bill if physicians prescribed generics. Are you saving *your* patients extra dollars?

Purepac, America's leading manufacturer of a national brand of generics, would like to show you the tremendous savings possible with just three of our 700 generic products:

DRUG		AVERAGE RX PRICE (100's)	\$ SAVINGS WITH PUREPAC	% SAVINGS WITH PUREPAC
Pavabid Capsules*	150 mg.	\$10.32		
Purepac Papaverine	150 mg.	3.95	\$6.37	61.7%
Equanil Tablets*	400 mg.	8.15		
Purepac Meprobamate	400 mg.	1.85	6.30	77.3%
Librium Capsules*	10 mg.	8.76		
Purepac Chlordiazepoxide HCl.	10 mg.	3.90	4.86	55.4%

*Registered trademarks of Marion Labs., Wyeth Labs., Roche Labs., respectively.

Purepac generics save money. Big money. Purepac is dedicated to providing your patients with quality products that are equivalent to their brand name counterparts at significant savings.

But we can't do it alone. We need your cooperation.

Send for Purepac's *free* Brand Name/Generic Name Reference Chart today. You'll receive an alphabetical listing of brand name drugs with their generic counterparts.

And next time you write a prescription, write for Purepac brand generics. Your patients will know you care.

PUREPAC. Competitive prices and peace of mind.

A Conversation With Donald Sharp Fredrickson, MD, Director of the National Institutes of Health: An Exclusive JOURNAL Profile/Interview

By Blaine Taylor

Contact Mr. Taylor, **JOURNAL** Managing Editor, for reprint and other data c/o the **JOURNAL**, 1211 Cathedral St., Baltimore, MD 21201.

Introduction

On Feb. 14, 1977, there appeared the following **Editorial** in the AMA publication **American Medical News**: "DR FREDRICKSON: "We congratulate the Carter Administration and HEW Secretary Califano for selecting a good man to run the National Institutes of Health. Donald S. Fredrickson, MD has been conducting the affairs of the Institutes with scientific distinction since his appointment by the Ford Administration.

"We haven't the foggiest notion

whether Dr. Fredrickson is a Democrat or Republican, and don't care.

"In this case, the Administration made two good choices. They chose Dr. Fredrickson, and they chose to keep politics, as much as is possible, from Federal science policy."

Elsewhere in the same issue appeared this short story, entitled **NIH Director to Keep Post**: "Officials at the National Institutes of Health breathed a sigh of relief at the announcement that NIH Director Donald S. Fredrickson, MD will be retained under the Carter Administration.

"The decision by Health, Education and Welfare Secretary Joseph Califano capped a nervous several weeks at the prestigious Institutes, where many expressed concern that the scientific spirit of NIH would be damaged if the popular Dr. Fredrickson had been ousted.

"Califano visited the NIH 'campus' in nearby Bethesda, MD

THE 300-PLUS ACRE NIH CAMPUS AT BETHESDA, MD.

(Picture courtesy of NIH.)

Chronology of Important Events in the Development of NIH Programs

- 1887 Research laboratory founded at Marine Hospital, Staten Island, NY, to meet new responsibilities of Marine Hospital Service.
- 1891 Hygienic Laboratory moves from Staten Island to Service headquarters, Washington, DC
- 1902 Advisory Board for the Hygienic Laboratory established; later to become National Advisory Health Council. Act of Congress makes Service responsible for biologics control.
- 1912 Name of Public Health and Marine Hospital Service changed to Public Health Service (PHS).
- 1930 Hygienic Laboratory becomes National Institute of Health (NIH) under the Ransdell Act.
- 1937 Congress authorizes National Cancer Institute (NCI). First research grants.
- 1938 National Institute of Health moves to land donated by Mr. and Mrs. Luke I. Wilson at Bethesda, MD. First research fellowships (NCI).
- 1944 Public Health Service Act, giving general research authority.
- 1945 Research grants extended, with central NIH responsibility.
- 1946 Division of Research Grants (DRG) established to review and evaluate applications for NIH grants to non-Federal institutions and scientists.
- 1947 First training grants (NCI). DRG starts research fellowship program.
- 1948 National Heart Institute authorized; other laboratories regrouped to form National Microbiological Institute (NMI), Experimental Biology and Medicine Institute (EBMI) and National Institute of Dental Research (NIDR). NIH becomes National *Institutes* of Health (NIH).
- 1949 Mental hygiene program of Public Health Service transferred to NIH and expanded to become National Institute of Mental Health (NIMH).
- 1950 "Omnibus Medical Research Act." National Institute of Neurological Diseases and Blindness (NINDB) and National Institute of Arthritis and Metabolic Diseases (NIAMD) established, the latter absorbing EBMI.
- 1953 Public Health Service becomes a constituent of newly-created Department of Health, Education and Welfare (DHEW). Clinical Center opens.
- 1955 NMI becomes National Institute of Allergy and Infectious Diseases (NIAID). Division of Biologics Standards formed, assuming NMI's biologics control function. Division of Research Services (DRS) created.
- 1956 Health Research Facilities Act, authorizing program of matching grants for research construction in non-Federal institutions.
- 1958 Division of General Medical Sciences (DGMS) created.
- 1960 PHS Act amended to provide for general support of research and research training programs in nonprofit institutions. International Health Research Act extends NIH international programs.
- 1962 Division of Research Facilities and Resources (DRFR) formed. National Library of Medicine (NLM), constituent of PHS since 1956, moves to NIH reservation.
- 1963 Two Institutes (authorized in 1962) established — National Institute of General Medical Sciences (NIGMS), superseding DGMS and National Institute of Child Health and Human Development (NICHD).
- 1964 Division of Computer Research and Technology (DCRT) established.
- 1965 Division of Regional Medical Programs (DRMP) created to administer the "Heart Disease, Cancer and Stroke Amendments of 1965."
- 1966 Division of Environmental Health Sciences (DEHS) established.
- 1967 National Institute of Mental Health becomes separate bureau of PHS.
- 1968 John E. Fogarty Interantional Center for Advanced Study in the Health Sciences (FIC) established. National Eye Institute (NEI) created. NINDB becomes National Institute of Neurological Diseases and Stroke (NINDS).
PHS reorganized under Assistant Secretary for Health and Scientific Affairs, DHEW. Bureau of Health Manpower (BHM), formed in PHS the previous year, and NLM become constituents of NIH, DRMP transferred to new Health Services and Mental Health Administration, PHS. Lister Hill National Center for Biomedical Communications established at NLM.
- 1969 DEHS becomes National Institute of Environmental Health Sciences (NIEHS). National Heart Institute renamed National Heart and Lung Institute (NHLI).
- 1970 Family Planning Services and Population Research Act.
- 1971 National Cancer Program established. Sickle Cell Disease Program initiated in NHLI.
- 1972 NIAMD becomes National Institute of Arthritis, Metablism and Digestive Diseases (NIAMDD). National Heart, Blood Vessel, Lung, and Blood Disease Program established. Division of Biologics standards transferred to Food and Drug Administration (FDA-PHS), where it becomes Bureau of Biologics. NCI and NHLI gain bureau status within NIH. National Cooley's Anemia Control Act.
- 1973 PHS reorganization establishes new agencies: Health Resources Administration (HRA), Health Services Administration (HSA), Center for Disease Control (CDC), and Alcohol, Drug Abuse, and Mental Health Administration (ADAMHA). Bureau of Health Manpower Education (BHME, formerly BHM) transferred to HRA.
- 1974 Sudden Infant Death Syndrome Act. National Institute on Aging (NIA) established. National Research Act revises research training authority and established national commission for protection of human subjects of research. National Diabetes Mellitus Research and Education Act. President's Biomedical Research Panel established.
- 1975 National Arthritis Act. NINDS becomes National Institute of Neurological and Communicative Disorders and Stroke (NINCDS). National commissions for epilepsy and Huntington's disease.
- 1976 NHLI becomes National Heart, Lung, and Blood Institute (NHLBI). Advisory boards created for diabetes and arthritis. National commission on digestive diseases established.
- 1977 Task force on environmental cancer and heart and lung disease appointed.
- 1978 NIH and new National Institute for Handicapped Research to coordinate studies. President's commission for study of ethical problems and a national center for health care technology created.

to make the announcement.
"To applause from more than 500 NIH workers, Califano said research is too important for partisan politics.

"The NIH Director is a Presidential appointee. Dr. Fredrickson...was appointed by President Ford in 1975.

"Depoliticization does not mean scientists can be isolated from human concerns," Califano warned. He said scientists must still expect pressure to improve medical care and conquer diseases and do so at lower costs."

NIH Components

As things turned out, Dr. Fredrickson survived Secretary Califano in the Carter Administration, and still holds sway over the mammoth organization from his office in Room 124 of Building Number One (where he was interviewed for the Journal on July 24, 1979). From over his Oriental rug-carpeted desk, the 55-year-old former cardiology researcher directs the affairs of the 11 "National Institutes:" Eye; Heart, Lung and Blood; Allergy and Infectious Diseases; Arthritis, Metabolism and

Digestive Diseases; Environmental Health Sciences; General Medical Sciences; Neurological and Communicative Disorders and Stroke, Aging; Dental Research; Child Health and Human Development and Cancer, plus the NIH hospital, the Clinical Center, of which he told the Journal, "It has over 500 beds and more than 800 laboratories, making it unique in the world as the biggest academic research hospital facility."

There are also the world-famous National Library of Medicine (which, through the MEDLARS terminal computer hook-up, is linked directly to Med-Chi) and several "Divisions" of NIH, too: Computer Research and Technology; Research Grants; Research Resources and Research Services.

Concerning its more than 12,000 employees (of whom about 2,200 hold doctoral degrees) located on its main 306-acre campus at Bethesda, MD (plus seven other campuses, such as that at Research Triangle Park, NC), the official 1978 NIH Almanac states: "From modest beginnings in a one-room Laboratory of Hygiene in 1887·

(renamed the Hygienic Laboratory four years later), the National Institutes of Health has evolved into one of the world's foremost and prestigious biomedical research centers. An agency of the Department of Health, Education and Welfare, the NIH is today the focal point for Federal biomedical research and support of research.

"Its mission is to improve the health of all Americans. To achieve this goal, the NIH conducts biomedical research in its own laboratories; provides grants to non-profit organizations and institutions for research and for medical education, including improvement or construction of library facilities, buildings, equipment and other resources; provides grants for the training of research investigators and supports biomedical communications through programs and activities of the National Library of Medicine... NIH maintains hundreds of laboratories containing complex and highly sophisticated research equipment..."

A summary table in the NIH Almanac shows that in 1947, the

Professionals'
Health

The Koinonia Foundation offers year-round programs in continuing education for medical professionals. These include evening classes, weekend experiences and one week workshops in:

- Preventing Burn-Out (October 13-16)
- Therapeutic Use of Touch (Nov. 2-4)
- Wholistic Medicine (Feb. Lectures)
- also Coping With Stress, Nutrition, Alternative Healing Therapies, etc.

Health is created everyday. For professionals and for their clients, Koinonia offers education in healthful lifestyle development. Recognized by the State of Maryland as a college-level, non degree granting institution. Call or write for free brochure and Newsletter.

total national investment in biomedical research and development was about \$87 million; in 1978, it was roughly \$6.1 billion. Of

this amount, the annual Federal investment has grown from about \$27 million to about \$3.8 billion, which represents almost two-thirds

of the biomedical research and development expenditures for the nation. Today, the NIH accounts for close to 40% of support from all

sources, most of it to non-profit institutions, particularly universities. Nearly 90% of the total NIH budget of some \$3.2 billion goes to support research conducted by investigators at universities, medical centers, hospitals and other, (mostly non-profit) research institutions. More than 2,500 institutions in every state and in several foreign countries are the recipients of NIH funds."

The Director

The man at the center of this giant behemoth, Dr. Fredrickson, lives in suburban Bethesda with his wife—the Dutch-born Henrietta Priscilla Dorothea Eekhof Fredrickson—and their two sons; Eric, 23, a student of history at Georgetown University and Rurik, 16, whose name derives from one of the three Viking founders of the Soviet city of Novgorod in Russia. Rurik attended Walt Whitman High School.

Dr. Fredrickson's official biography (as published in the 1978 NIH Almanac) states:

"Dr. Donald S. Fredrickson, internationally-known authority and researcher in lipid metabolism and its disorders, became Director of the National Institutes of Health on July 1, 1975. Immediately prior to this appointment, Dr. Fredrickson had served for one year as President of the Institute of Medicine of the National Academy of Sciences.

"His association with NIH, however, spans more than two decades, beginning in 1953, when he joined the scientific staff of the then-National Heart Institute (renamed the National Heart, Lung and Blood Institute in 1976) as a Clinical Associate.

"During his long research career in the Federal service, Dr. Fredrickson has held numerous positions at NIH, several in the Heart Institute simultaneously. From 1955-61, he was a member of the Senior Research Staff of the Laboratory of Cellular Physiology and Metabolism. Dr. Fredrickson then served as Clinical Director (1961-66), while continuing his re-

search as Head of the Section on Molecular Diseases, Laboratory of Metabolism (1962-66). He was appointed Institute Director in 1966, serving in that capacity until 1968. Dr. Fredrickson combined this executive responsibility with research as Chief of the Molecular Diseases Branch (1966-74) and as Director of Intramural Research (1967-74.)

"His earliest research interests centered on the mechanisms of synthesis, transport and the metabolism of fats. These studies also investigated the effectiveness and mode of action of different drugs and diets in reducing cholesterol and other fats in the blood. Dr. Fredrickson later conducted and directed research directed at the structure of the plasma lipoproteins, their importance in the transport of fats and the genetic factors regulating their metabolism and concentration in blood. It was during this period that Dr. Fredrickson discovered two new genetic disorders: Tangier disease (absence of high density lipoproteins)

¹ Includes supplemental request for population; rescission of Child Health Facility and transfer for OD pay costs.

Note: Senate allowed an increase of 70 positions over the President's Budget for aging. □

and cholesterol ester storage disease, a lysosomal enzyme deficiency.

"In 1965, Dr. Fredrickson and coworkers introduced a system for identifying and classifying blood-lipid abnormalities on the basis of plasma lipoprotein patterns. From this work came the recognition of three new monogenic causes of hyperlipidermia; type 3 hyperlipoproteinemia, type 5 hyperlipoproteinemia and what is now called familial hypertriglyceridemia. The system received prompt acceptance by the World Health Organization, was extended to all textbooks and reports on this subject and is now used widely by laboratories here and abroad.

"Research findings of Dr. Fredrickson and colleagues have also contributed significantly to new knowledge on apolipoproteins, including descriptions of several previously unknown apoproteins and the completion of the amino acid sequence of various apoproteins and other data concerning their function and structure.

"Dr. Fredrickson was born Aug. 8, 1924 in Canon City, CO. He re-

ceived both his BS (1946) and MD degrees (1949) from the University of Michigan, and was certified by the American Board of Internal Medicine in 1957. He did post-graduate work at Peter Bent Brigham and Massachusetts General Hospitals and the Harvard Medical School prior to coming to NIH.

"He is a member of numerous professional societies, among them: Alpha Omega Alpha, American Academy of Arts and Sciences, American Association for the Advancement of Science, American College of Cardiology (Fellow), American College of Physicians (Fellow); American Federation for Clinical Research; Phi Beta Kappa; Phi Kappa Phi; American Physiology Society; American Society for Clinical Investigation; American Society of Human Genetics; Association of American Physicians; British Cardiac Society (corresponding member); Harvey Society (honorary); Institute of Medicine (NAS); International Society of Cardiology; National Academy of Sciences; Medical Society of Sweden (honorary) Institute of Society,

Ethics and the Life Sciences (associate member); American Heart Association, Council for the Study of Arteriosclerosis; Honorary Fellow of the Council on Clinical Cardiology, Deutsche Gesellschaft für Innere Medizin (corresponding member) and the Peripatetic Club.

"He is also a member of the Advisory Council of the American Center for Chinese Medicine, a life associate member of the Intra-Science Research Foundation and has served on numerous editorial boards.

"Dr. Fredrickson's research achievements have won him many honors and awards. These include the Convocation Gold Metal Award of the American College of Cardiology (1967), the James F. Mitchell International Award for Heart and Vascular Research (1968). The DHEW Distinguished Service Award (1971), the **Modern Medicine** Distinguished Achievement Award (1971) and others.

Additional honors accorded Dr. Fredrickson include election to the National Academy of Sciences (1973), the Jiminez-Diaz Award (Madrid), the Intrascience Award

SECURITY OFFICE PARK

NOW LEASING FOR SEPTEMBER OCCUPANCY

A development of two 3-story contemporary office buildings located opposite the Security Mall in a carefully preserved stand of full-grown trees.

Located approximately ½ mile from I-695 and Security Boulevard and offering:

- ☐ 50,000 square feet of prime office space
- ☐ Units from 500 square feet
- ☐ Convenient free parking available
- ☐ Interior improvements to suit tenant
- ☐ Carpeting throughout

The Interview

Dr. Fredrickson, I know that you serve "at the pleasure of the President," but to whom do you actually report?

I report directly to the Surgeon General of the US, Public Health Service, who is also the Assistant Secretary for Health, and through him, to the Secretary of HEW.

Is NIH under both the Public Health Service and HEW?

Yes, it is, because the Public Health Service is really a principal operating component of HEW—it's the "h" in Health—but not all. "H" in Health is two things: PHS and health financing.

Is NIH Manageable?

Can one man—ANY ONE person, really—adequately supervise all of this? It's almost like being

President of the world! I guess this is a type of question like "Can anyone adequately be Governor of California or President of the US?"

Yes, you can! I think that it's for others to **judge**, but my own view is that you can. Most of NIH's Institutes were set up by individual statute. They get separate appropriations of money from Congress; in fact, in the legislation that authorizes NIH, the Director is barely mentioned! I am deeply involved, however, in their planning and budget preparation, and join with the Institute Directors in presenting and defending their budget requests to Congress.

The job of the Director is really to take this great collective and set a common style for it, and by persuasion—rather than by raw authority—convince people that they ought to do certain things. I have to choose the Institute Directors and do a lot of appointing, but it's possible, I think, to govern such an organization from a central focus because that government is, primarily, a modulating influence.

Did you know that your persuasion analogy was pretty much

the definition of the Presidency that Harry S. Truman used?

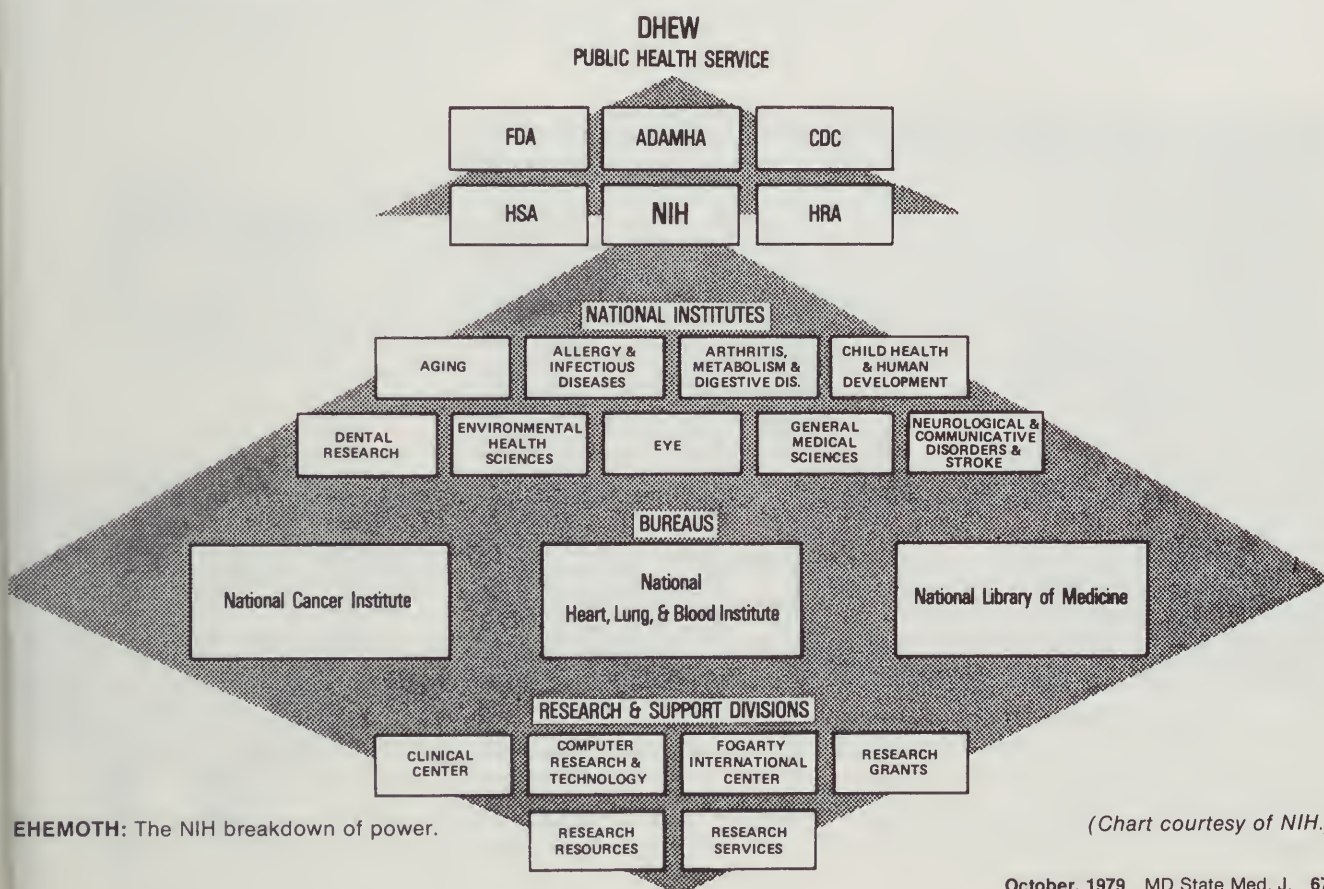

Really? Well, I understand that definition, and I also understand where the buck stops—because it, too, stops here—which is something **else** he said!

He said, also, as he was going out of office, of his successor, Dwight Eisenhower, "Poor Ike! He'll come in here and give orders like he used to in the Army and nothing will happen!"

Well, I think that's true. It's like the Presidency in a very limited way, where the Cabinet would represent the Institutes. There's a lot of independent life to agencies and to bureaucracy. You can only modulate its style, but you **can** make a lot of difference, though, by setting the tone and insisting upon it.

Do you see yourself as the person merely coordinating all this? Do you interfere with your subordinates or give them their heads and let them go?

They get lots of delegated authority—I don't care to do their jobs for them. I wouldn't have time to do that anyway, as I have to spend a lot of time with the Congress. I'm the interface between

EHEMOTH: The NIH breakdown of power.

(Chart courtesy of NIH.)

this campus and both the Congress and the Administration.

Congressional Relations

Before what Congressional committees do you appear?

I appeared 34 times before the 95th Congress—that included a lot of Committees—but the principal ones were the health subcommittees of the House and Senate Appropriations Committees, and the health subcommittees of the two authorizing committees—the Senate Committee on Labor and Human Resources and the House Committee on Interstate and Foreign Commerce.

Working With EMK

How do you find Sen. Kennedy to work with?

I enjoy working with Kennedy. I think that he's vibrant and very interested in matters of health, is informed and, of course, has a big and active staff so that he keeps us on our toes.

Do you see him as someone hostile to you? Doctors seem to think he's inimicable to their best interests at times.

When I first came to NIH, I think he had a particular view about scientific research and academic medicine that was somewhat sharper in a critical sense than it is today. I think we've come to

know each other. I don't find him difficult to work with, no. The people I represent are well-respected by the Congress as a whole.

Is academic medicine viewed in Washington as in any way partisan Democrat or Republican?

No, it doesn't have a party label, but one that all elite institutions do—self-serving—in the eyes of many people in politics. Its' not that, but it is a special constituency, like all the other interests in Washington.

NIH/CDC

Do you have anything to do with the Center for Disease Control in Atlanta?

That's one of our sister agencies, of which there are six, and with which we work very closely. It's not **under** me, though.

Should it be?

No, it **should** be separate, because it carries out both service programs and quasi-regulatory activities, and those are two things we don't think NIH should ever do.

Swine Flu '76

Let's discuss the swine flu epidemic of 1976, which was both predictable and predicted. Did NIH have anything to do with that?

Influenza is a problem that's
(Continued on page 71)

PAP TEST USING LASER TECHNOLOGY: One of the many uses for the laser in medical research is as a light source to detect premalignant and malignant cells from Pap test specimens. Shown here are gynecologic cells passing in a stream through the laser beam where each cell is analyzed. Abnormal appearing cells can be sorted from the rest of the cells and later examined by a pathologist for evidence of cancer. (Photo courtesy of NIH.)

QuinammTM

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATIONS: For the prevention and treatment of nocturnal recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis, and static foot deformities.

CONTRAINDICATIONS: Because of the quinine content, Quinamm is contraindicated in women of childbearing potential, in pregnancy, in patients with known quinine sensitivity, and in patients with glucose-6-phosphate dehydrogenase deficiency. Hemolysis (with the potential for hemolytic anemia) has been associated with a G-6-PD deficiency in patients taking quinine.

PRECAUTIONS: Thrombocytopenic purpura may follow the administration of quinine in highly sensitive patients. Recovery will follow withdrawal of the medication.

Cinchona alkaloids, including quinine, have the potential to depress the hepatic enzyme system that synthesizes the vitamin K-dependent factors. The resulting hypoprothrombinemic effect may enhance the action of warfarin and other oral anticoagulants.

ADVERSE REACTIONS: Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. If ringing in the ears, deafness, skin rash, or visual disturbances occur, the drug should be discontinued.

DOSAGE AND ADMINISTRATION:

1 tablet upon retiring. When necessary, 1 additional tablet may be taken following the evening meal.

Product Information as of September, 1977

each tablet contains quinine sulfate 260 mg., aminophylline 195 mg.

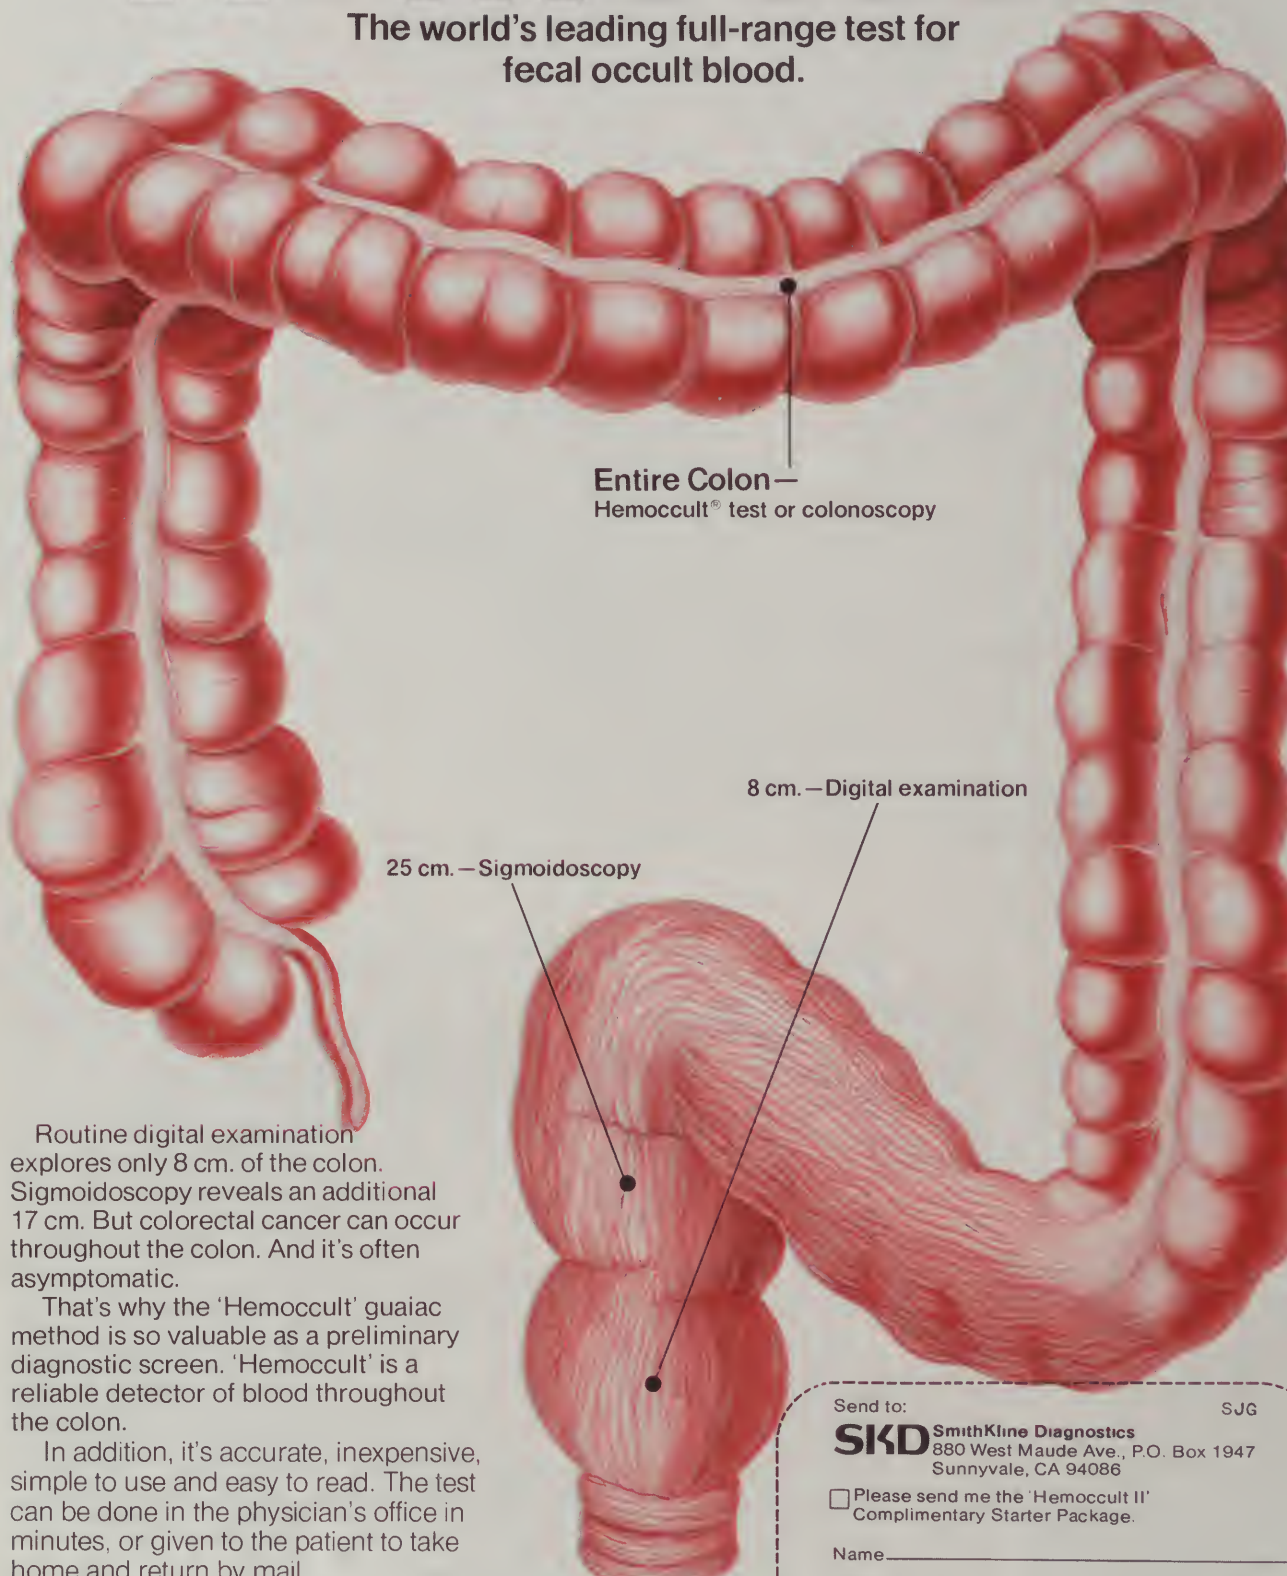

specific therapy for painful night leg cramps

Nocturnal recumbency leg muscle cramping is frequently an unwelcome bedfellow for many patients—especially those with arthritis, diabetes or peripheral vascular disease... consider Quinamm... simple, convenient dosage—usually just one tablet at bedtime... can provide restful, welcome sleep without night leg cramps.

See opposite page for prescribing information.

Hemoccult[®]

The world's leading full-range test for
fecal occult blood.

Entire Colon —
Hemoccult[®] test or colonoscopy

8 cm. — Digital examination

25 cm. — Sigmoidoscopy

Routine digital examination explores only 8 cm. of the colon. Sigmoidoscopy reveals an additional 17 cm. But colorectal cancer can occur throughout the colon. And it's often asymptomatic.

That's why the 'Hemoccult' guaiac method is so valuable as a preliminary diagnostic screen. 'Hemoccult' is a reliable detector of blood throughout the colon.

In addition, it's accurate, inexpensive, simple to use and easy to read. The test can be done in the physician's office in minutes, or given to the patient to take home and return by mail.

More than 112,000 cases of colorectal cancer will occur in the United States this year. The earlier they are diagnosed, the greater the chances for successful treatment.

'Hemoccult' is available through local distributors, nationwide.

monitored by a troika: the National Institute of Allergy and Infectious Diseases, the Center for Disease and the Bureau of Biologics of the Food and Drug Administration (FDA). These three organizations do research, develop new vaccines, do surveillance of epidemics, detect new strains and, finally, the testing and certification of those vaccines.

Are you the man who calls the President and says, "Mr. President, we have a swine flu epidemic on our hands?"

No, that should be the Surgeon General, nor do I tell him, because the epidemic thing is really in the purview of the CDC. They are the epidemic surveillance team. During the '76 outbreak, our Institutes helped with the research aspects of developing the vaccines, though.

Biological Warfare Role

What about in the case of biological warfare used against the US? What would be the role of NIH?

The CDC is the strike force that's called first; they, then, call upon us for assistance, technical exploration, developmental research and whatever else may be

required to improve our overall knowledge of the situation.

"Legionnaire's Disease"

Did you have anything to do with the so-called "Legionnaire's Disease?"

Again, we played a secondary role to CDC.

NIH's Central Thrust

What is, in your mind, the biggest activity that NIH has now?

The biggest—the single most important—is funding the investigator-initiated grants to the 16,000 investigators whom we support by that means in this country.

Combatting Cancer

How, if at all, does NIH link itself with state and local efforts to combat cancer, such as at the Baltimore Cancer Research Center and at Johns Hopkins?

The Cancer Institute—through its comprehensive cancer centers and other large grants—has a tremendous influence on the treatment of cancer in this country. It touches the lives of somewhere between a tenth and a third of all people who have cancer in the

sense of making available drugs under tests or participating at some point in their care.

I know you can't say for sure, but, in your opinion, will there be a cure for cancer in your lifetime or even in mine?

We will understand the causes of many kinds of cancer in our lifetimes without any question; whether that leads to cure or not I'm not sure, but I think it probably will.

Medical Détente

One of the offsprings of détente may well be medical coordination with the Union of Soviet Socialist Republics (USSR), the People's Republic of China and other Eastern Bloc countries wherein we trade health information back and forth. Is any of that going on now?

NIH has a score of arrangements with different countries—many of them broader than NIH through the Public Health Service. We have been the first among many national organizations to have medical and scientific diplomacy, certainly in the area of biology, so that we've been cooperating

for decades with many countries. We have a research agreement with the Soviet Union that contains 10-12 major categories. They come here one year, we go there, etc. Agreements have also been signed with the People's Republic of China. We have the Fogarty International Center that keeps tabs on all those things. We are the major international activity of HEW and cover all the major disease areas: cancer, health, environment—virtually the whole spectrum.

Some Components Discussed

Discuss in broad, general terms, if you will, some of the various Institutes comprising NIH.

Well, the National Institute for Child Health and Human Development has two major centers, one for population research and another for maternal and child health. It's one of the non-categorical Institutes that's responsible to give us more wanted and healthier babies and to start them on a healthy life.

The National Eye Institute is one of the younger Institutes. It does a lot of research, and has been, I think, a major factor in organizing the eye research community, and has greatly increased the level of quality of eye research related to vision in the US.

The National Institute on Aging is the newest one, is still in its infancy and waiting to get more support. It will also be interesting as one of the first organizations for introducing social sciences along with the hard sciences into research in what certainly will be a major public health problem.

The National Institute for General Medical Sciences is the basic science Institute. It does **not** have an intramural research program—and is the **only** Institute that doesn't, but is very important for supporting basic research that's not related to disciplinary medicine.

The National Heart, Lung and Blood Institute is the second largest, and is responsible for an enormous area of pathology...

What're their projections for the next five years over where they'll be heading?

There's a big drop in mortality from coronary artery disease in this country. Part of that is due to vigorous control of hypertension and better ways to treat it. That's still a major activity of theirs. There's a lot of heart disease to be worked upon—arteriosclerosis. The Institute's busy activating a vigorous approach to diseases of and structure of the lung and has the major purse for research on disease of the blood, too.

The Environment

Environmental Health Sciences provides the knowledge **behind** regulation...

If you had to come down—in your Congressional testimony—on the side of keeping environmental regulations where they are or relaxing them in favor of industry, which would you do?

I'd be as tough as I could within reason to maintain the health standards of the environment. We're going to **have** to make certain concessions, but we do that very reluctantly. NIH **doesn't** regulate, however.

Peering Into the Future

How do you view the future at NIH?

We regard tomorrow's medicine as today's research and, therefore, we—collectively—have a tremendous influence on medical practice. We want to make sure that our efforts **are** meaningful, i.e., that they eventually result in practical things. We started last year a new exercise on technology consensus which will touch the lives of many practitioners where we catalyze the organization of people from outside of practice and the scientific community, to try to come to grips with what is the state of the art in health care practices. One thing we're now examining is: What **really is** the value of giving estrogen to post-menopausal women? As we get nearer to those tough questions, we're trying to provide answers and help the community to find its **own** answers, because standard-setting **is** coming. Just as we have National Health Insurance waiting in the wings, you can be sure that the setting of standards for practice for remuneration is only around the corner. We would like to help the medical community to really do it **by itself**. If it doesn't—if we **don't** all manage to do that—than it **will** be done by some people in dark offices, and we'll have a lot less to say about it!

NHI and NIH

Since you raise that spectre, how WILL the passage of NHI affect what NIH does?

It'll mean we'll have to accelerate some of these exercises and

TISSUE PROCESSOR: Technician in the NCI's Laboratory of Pathology loads the histomatic tissue processor with a basket of tissues to be processed. The basket holds small, disc-shaped containers of tissue specimens. The instrument automatically processes 100 of these specimens at one time, immersing them in a series of solvents for fixing, dehydrating and clearing and in paraffin for infiltration. Laboratory technicians prepare histologic slides from these processed tissues for close scrutiny under the microscope by a pathologist to determine whether any of the cells are cancerous. (Photo courtesy of NIH.)

perhaps be very attentive to—as we think we are **now**, but even more so—the big problems that cost all the money. We'll have NHI within five or 10 years whether Sen. Kennedy is its broker or not. **Somebody** will do it.

Thank you, Dr. Fredrickson.

Acknowledgments

The author thanks the late **Journal** Editor Dr. C. Thomas Flotte, for suggesting this story; Mrs. Mildred Chronister for secretarial service and Dr. Fredrickson's own able staff members: Mrs. Bel Ceja and Mrs. Gretchen Sharpe. □

Doctors in the News

Dr. Milner Named

The appointment of **Sheldon Milner, MD** as Chief of the newly formed Division of Oncology at Lutheran Hospital of Maryland, Inc., has been announced by **Herbert Kushner, MD** Chief of Medicine.

"By providing care to cancer patients, the new division adds

another component to inpatient care capabilities," Dr. Kushner said.

In addition to his responsibilities for inpatient oncology services, Dr. Milner will be directing the Outpatient Program, which is for cancer patients well enough to be seen on an outpatient basis and is scheduled every Thursday

DR. MILNER

morning in the Hospital's Outpatient Care Center, located on Rayner Ave. near the corner of Ashburton St. in Baltimore.

Dr. Milner received his medical education at the University of Maryland School of Medicine. He interned and did his residency at the University of Maryland Hospital, and was a clinical assistant at the Baltimore Cancer Research Center.

The outpatient component of the oncology program is supported by a grant from the Morris Goldseker Foundation. □

Here's how to set up your own retirement plan and earn **8%** interest

Individual Retirement Accounts at The Savings Bank allow you to set aside as much as 15% of your annual income up to \$1500 a year and deduct it from your taxable income.

NO TAXES WILL BE REQUIRED ON THIS AMOUNT UNTIL YOU RETIRE—and by then you'll probably be in a lower tax bracket. See how much \$1500 a year can add up to in a Savings Bank I.R.A. Account,* the pension plan for professionals.

Years	Total I.R.A. Deposits	Total Interest Earned	Savings For Retirement
10	\$15,000	\$ 8,909.02	\$ 23,909.02
20	\$30,000	\$ 47,114.85	\$ 77,114.85
30	\$45,000	\$150,516.22	\$195,516.22

For more information or to open your own Individual Retirement Account, contact any office of The Savings Bank today.

Main Office: Charles and Baltimore Sts.
and 20 other convenient locations.

*Based on contributions of \$1500 the first of each year earning 8% interest annually and assuming the rate remains constant.

The MPP Nurse. A Special Person.

All the nurses who work for Medical Personnel Pool are special. What makes them so special? Being a skilled professional and being associated with other professionals with extremely high standards of excellence. Knowing their skills will be fully utilized by MPP staff's careful assignment matching. And also, very importantly, by being able to devote as much time to their nursing career as they wish without sacrificing their personal lives.

MPP's concept of flexible scheduling allows our employees to work as many hours as they wish or as little on the days and weeks convenient to their individual schedule. Everyone benefits as valuable nursing skills which would otherwise be lost are being provided for patient care.

A flexible schedule is only one of the many benefits that await you when you work for Medical Personnel Pool, one of the most highly respected nursing services in its field. Choice of assignments, extensive insurance coverage including professional and general liability and worker's compensation insurances, in-service education, competitive salary, and a reputation for high standards are just a few of the others.

To learn more about the many opportunities awaiting you at Medical Personnel Pool, stop by your local MPP office.

Periodical Use by Med-Chi Members

A major function of the Faculty Library is to provide Faculty members with copies of periodical articles. One of the benefits of membership is the ability to receive up to 50 pages of photocopy each month at no charge. This means that each Faculty member is entitled to seven or eight articles each month. Members may request more than 50 pages in any one month, but are charged \$.10 per page for the amount over 50 pages. This privilege is not transferable from one Med-Chi member to another, or from a member of the Faculty to a physician who is **not** a member of the Faculty or from a member of the Faculty to an allied health worker or nurse. All requests for photocopied articles must be submitted in the name of a member physician and will be distributed to that member. Requests for photocopying may be submitted directly by telephone (only for requests for one to two articles) or mail or through the librarian at a hospital where the physician has privileges.

When a request is submitted through a hospital librarian, the articles will be sent to the hospital library for distribution to the requesting physician, unless the request specifies that the articles are to be sent directly to the physician. Med-Chi members who use the photocopy service are bound by the provisions of the US Copyright Law, Title 17, which permits an individual to procure one copy of a copyrighted article for his own use for educational, research or scientific purposes. The Faculty Library staff will not honor any request for photocopying that they believe to be in violation of the copyright law.

The Faculty Library fills photocopy requests from its own collection of nearly 1,000 periodical titles. In addition, it can obtain copies of articles from journals that it does not own through its cooperative activities with other health sciences libraries including those at the Johns Hopkins University, the University of Maryland and the National Library of Medicine. Between May, 1978-April, 1979, the Faculty Library filled more than 8,000 requests for photocopied articles from Med-Chi members; of these just over 2,000 had to be obtained from other libraries.

The fact that the Library now fills only 75% of members' requests from its own collection is a cause for alarm. In past years, the proportion has been somewhere between 90%-95%. This statistic means that now one-fourth of the members' photocopy requests take 10 days or longer to answer, while the Library tries to locate another library that has the needed periodical and then obtain a photocopy of the article through the mail. This situation also raises the specter of the Med-Chi Library's becoming too much of a burden on other libraries by relying upon them to fill some needs that it, itself, should be meeting.

In an effort to correct this situation and restore the balance to at least 90%, the staff of the Library has taken

a very careful look at the interlibrary loans requested for Med-Chi members over the past couple of years. These have been analyzed by the number of times each title was requested, the year in which each requested article was published and the number of individual members who requested that journal title. The study proved most revealing. The Faculty Library would be able to reduce the number of times it has to go to another library for an item it does not own by more than half if it were to add 50 journal subscriptions. The titles of these new journals would be those from which photocopies have been requested by the largest number of individuals and most often from other libraries.

However, acquiring 50 additional journal subscriptions is not that easy. The average price for a year's subscription to one of the 50 needed journals is \$70, and the Library is already spending all the income to its endowment funds for its present journal subscriptions and purchases of monographs.

Looking at the journal titles from which we request photocopies from other libraries is only half the story. The other half concerns the titles to which Med-Chi now subscribes, receives on exchange for the **Maryland State Medical Journal** or receives free that are not used by Med-Chi members.

After examining all the interlibrary loan requests from the past couple of years, the Library staff next examined the records of members' use of periodicals that belong to the Med-Chi Library. This was easier for this Library than for most other libraries because almost all the use of the Faculty Library is by mail and/or by telephone, with practically no walk-in use. As a result, the Library had documented records of every use made of its journal collection, usually in the form of a photocopy request submitted by a Med-Chi member to get a particular article.

By examining these request forms, the Library staff were able to determine which items are used the most by Faculty members and to record the years in which the requested articles were published. The major result of the study (a predictable result, according to the experience of other libraries) was to show that a large portion of the Faculty Library's collection of medical periodicals is not used by the membership and that a few very select items account for most of the use of its collection. It remains, then, to evaluate especially the titles for which there is no indication of use. This analysis would consider whether these titles are purchased by the Library on subscription, received in exchange for the **Maryland State Medical Journal** or are received as gifts. The mere fact that the Faculty does not have to pay for a particular title does not mean that it is cost-free; considerable staff time is spent in checking in journal issues, shelving them and preparing them for binding—and there is, of course, the cost of binding.

In order to allow for subscriptions to additional periodical titles that will be used by Faculty members, many unused titles will have to be dropped completely. Because they are not used by members, back volumes will be offered for sale to other libraries or discarded. Those journals that are received in exchange for the **Maryland State Medical Journal** will be evaluated in comparison with the subscription and mailing costs of the **Journal**. While many fine titles are received in exchange for our own **Journal**, others do not compare in value and represent merely a burden on both the publishing of the **Journal** and the Library. The exchange for these particular items will be dropped.

Finally, the policy of keeping all the materials which are given to the Library will be changed, and in cases in which a publication is not being used or is not relevant to the Library's collection, efforts will be made to have the Library removed from its mailing list and accumulated issues will be sold or discarded.

A further result of this study will be to evaluate the practice of binding all the Library's journals. If a particular journal is seldom used a year or two after it has been published, it is economically advantageous, and practical in terms of space, to purchase the publication on microfilm instead of binding it. The Library now owns a microfilm/microfiche reader-printer and could still provide copies of any article published in this medium.

All of this may seem very logical and make good sense from a business point of view, tempting some to wonder why it has not been done in the past. One reason is that in recent times there has been a drastic change in the philosophy of medical libraries. The library is increasingly being seen in its role of providing information instead of being a mere storehouse of information. Except for major national libraries, such as the National Library of Medicine, and major university libraries, such as the Countway Library at Harvard, it is impractical to expect a library to contain nearly everything that has ever been published on a particular subject. Space and budget limitations immediately restrict the Faculty Library from such a philosophy. A more realistic approach is to develop and maintain a library that can satisfy about 95% of the information requests that will be directed to it by Faculty members. The remaining 5% of these requests can always be obtained from other sources, such as the National Library of Medicine. This approach is in line with the purpose and function of the Faculty Library—to meet the medical information needs of the Faculty membership. Given the current rapid increase in the number of individual members making use of the Faculty Library each month and the increased demands being placed upon the Library by those who have used it in the past, this is the only approach to the philosophy of the Library that will allow it to function in an efficient and effective manner.

In the future, members should be able to expect even faster and better responses to their information requests, especially for photocopies of periodical articles. A list of all the new journal subscriptions added for 1980 will appear on a future **Library Page** of the **Journal**.

Rare Medical Books and Histories of Medicine for Sale by the Faculty Library

The Faculty Library is publishing a list of rare medical books and other items related to the history of medicine that are available for sale. A new list comes out about once every two months. The items to be sold are duplicates from the Faculty's collection and materials that are donated to the Faculty Library and prove to be duplicates. Proceeds from these sales go to the support of the Faculty Library.

To get on the mailing list for these periodic lists, write or call me at the Faculty Library.

Hopkins Holds Symposium on Women Physicians

One-fourth of the 16,000 students entering medical school in the US this year will be women. They will join 38,000 women already in practice, about 10% of the nation's doctors.

What impact are they having on medicine as it is practiced in our society? How well are they fitting into a traditionally male bailiwick? How do they handle a career in one of the most exhausting and time-consuming professions in addition to the demands of their private lives?

These and other questions will be explored October 9-10, 1979 at The Mary Elizabeth Garrett Symposium on **Women Physicians in Contemporary Society**, to be held at the John Hopkins University School of Medicine in Baltimore. The 15-guest faculty will include Mary Ellen Avery, MD, Physician-in-Chief, Children's Hospital Medical Center, Boston; Leon Eisenberg, MD, Professor of Psychiatry, Harvard Medical School; Carola Eisenberg, MD, Dean for Student Affairs, Harvard College; Carolyn M. Elliott, PhD, Director, Center for Research for Women, Wellesley College; Lesley Stahl, CBS-TV news correspondent and Jeremiah Barondess, MD, Professor of Medicine, Cornell University Medical Center and immediate Past President of the American College of Physicians.

These distinguished guests and 17 faculty and staff members of the

Hopkins School of Medicine will discuss a variety of major issues, starting with a profile of women and men physicians who have graduated from Harvard Medical School between 1949-79: who they are, what they're doing, aspirations, frustrations and achievements.

Some of the other panels will examine the societal implications of the increasing number of women doctors; preceptions of women doctors by themselves, their colleagues, friends, patients and society; women physicians' choices and roles in professional and private life and the impact of women on national health policies.

The symposium is named after a woman who wasn't even an MD, but nearly 100 years ago, Mary Elizabeth Garrett and four determined female friends raised more than half a million dollars and fought considerable prejudice to help establish Johns Hopkins as the first school of medicine in the country that would admit women and men on equal terms.

Part of a country-wide movement to provide higher education for women, they seized the financial problems of the fledgling Johns Hopkins University as a way to advance the cause of women in medicine. Ms. Garrett gave \$354,000, and fundraising committees that included two president's wives contributed the rest. The \$500,000 endowment was offered only with the proviso that women be accepted on the same terms as men. The all-male University Board of Trustees reluctantly accepted the offer.

Since the first medical school class entered in 1893 with 15 men and three women, Hopkins graduates have included **Florence Sabin, MD**, first woman member of

the Rockefeller Institute for Medical Research and first woman elected to the National Academy of Sciences, and **Helen Brooke Taussig, MD**, "first lady of cardiology," who developed the famed blue-baby operation with Dr. **Alfred Blalock**.

A more recent well-known graduate will be on the symposium panels: **Caroline B. Thomas, MD**, who discovered that rheumatic fever could be prevented by use of sulfa drugs and has since become famous for her 30-year study of the relationship between health and personality in Hopkins School of Medicine graduates.

The symposium will be chaired by **Carol Johnson Johns, MD**, Associate Professor of Medicine at the Hopkins School of Medicine. An internationally known expert in chest disease, Dr. Johns was recently appointed Interim President of Wellesley College, MA.

"I believe this symposium will serve as a milestone and provide a guide for future directions for the maximal benefits for society and medicine with regard to women physicians," Dr. Johns says.

The symposium will be co-chaired by **Bernadine Bulkley, MD**, Associate Professor of Medicine, who directs the Coronary Care Unit at the Hopkins Hospital, and also chairs the affirmative action committee. □

Shape Up For Life

Shape Up For Life is the American Medical Association's new nationwide campaign. The above logo, designed by Draper Daniels, Inc., Advertising, will appear on all campaign materials. It symbolizes the good feeling which comes from healthy living. Radio and television public service announcements will be airing this Fall to carry the message into homes throughout the country. A poster and pamphlet suitable for placing in doctors' offices, schools, churches, clinics, businesses and other public places are available through the Auxiliary.

The campaign is a two-year effort. The first phase, just getting underway, will concentrate on foods for fitness. The second phase, to be introduced in July, 1980, will focus on physician fitness. The whole program will be directed by the national Health Projects Committee. Its aim is to 1) inform Americas that proper nutrition and exercise are vital to good health and fitness and 2) make them aware of what they can do for themselves to keep healthy. This is the Auxiliary's contribution to the health care industry's Voluntary Effort for cost containment.

Philip White, ScD, Director of the AMA Department of Foods and Nutrition, spoke to Auxiliary delegates at the annual convention in Chicago last July about nutrition in this country. To combat the misinformation and distortions about food and health, he suggests an all-out offensive to establish the positive values. Health and vitality are the dividends of good nutrition. Even though these qualities are good in this country, they are not what they should be. The basic problem seems to be lack of concern about good nutrition rather than lack of information or education on the part of our citizens.

The greatest nutritional problem in this country is obesity, due mostly to overindulgence and lack of exercise. We need to provide a better environment for health. Emphasis on prevention rather than treatment of obesity could be a step in that direction.

There is no such thing as an American diet. We have a wide variety of food patterns and practices. The problem is that the variety is too limited, i.e., the only vegetable many people seem to eat is the potato.

A survey being conducted by the US Department of Agriculture shows that women seem to be subsisting on a caloric intake just above the amount needed for basal metabolism. If these women are healthy, then they have to be extremely inactive, or all the research done on caloric requirement is in error. This is a form of malnutrition, meaning bad nutrition, not deficiencies, but continued bad nutrition can lead to deficiencies. The concept of good nutrition as set forth by the AMA, and now before the House of Delegates for policy acceptance, stresses variety, moderation and constraint. There is no need for the large amounts of vitamins and miner-

als in dietary supplements. Adequate diet and food intake are more than sufficient to provide nutritional needs. If a supplement is needed, it should be given only under the supervision of a professional person.

It is most important that poor nutritional habits observed in children be corrected immediately. If not, they tend to carry over into adulthood and are very difficult to overcome. Our efforts should be concentrated on our youth. Present the idea to families and communities that good nutritional habits and good physical activity are as important as love and education for our children.

In summary, Dr. White said that nutrition and exercise are inseparable. There is no known combination of foods that will correct problems caused by inactivity. Also, no one food can be judged except as it relates to the whole dietary program. This is why variety is stressed so that we are not dependent on a given food.

A positive personal, family and community image in fitness and health is essential. That means good nutrition. Shape Up For Life and manifest health, vitality and productivity!

MRS. DEWITT E. DELAWTER, Chairman,
Health Projects Coordinator

Tenuate®

(diethylpropion hydrochloride NF)

Tenuate Dospan®

(diethylpropion hydrochloride NF) controlled-release

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATION: Tenuate and Tenuate Dospan are indicated in the management of exogenous obesity as a short-term adjunct (a few weeks) in a regimen of weight reduction based on caloric restriction. The limited usefulness of agents of this class should be measured against possible risk factors inherent in their use such as those described below.

CONTRAINDICATIONS: Advanced arteriosclerosis, hyperthyroidism, known hypersensitivity or idiosyncrasy to the sympathomimetic amines, glaucoma. Agitated states. Patients with a history of drug abuse. During or within 14 days following the administration of monoamine oxidase inhibitors, (hypertensive crises may result).

WARNINGS: If tolerance develops, the recommended dose should not be exceeded in an attempt to increase the effect; rather, the drug should be discontinued. Tenuate may impair the ability of the patient to engage in potentially hazardous activities such as operating machinery or driving a motor vehicle, the patient should therefore be cautioned accordingly. **Drug Dependence:** Tenuate has some chemical and pharmacologic similarities to the amphetamines and other related stimulant drugs that have been extensively abused. There have been reports of subjects becoming psychologically dependent on diethylpropion. The possibility of abuse should be kept in mind when evaluating the desirability of including a drug as part of a weight reduction program. Abuse of amphetamines and related drugs may be associated with varying degrees of psychologic dependence and social dysfunction which, in the case of certain drugs, may be severe. There are reports of patients who have increased the dosage to many times that recommended. Abrupt cessation following prolonged high dosage administration results in extreme fatigue and mental depression. Changes are also noted on the sleep EEG. Manifestations of chronic intoxication with anorectic drugs include severe dermatoses, marked insomnia, irritability, hyperactivity, and personality changes. The most severe manifestation of chronic intoxications is psychosis, often clinically indistinguishable from schizophrenia. **Use in Pregnancy:** Although rat and human reproductive studies have not indicated adverse effects, the use of Tenuate by women who are pregnant or may become pregnant requires that the potential benefits be weighed against the potential risks. **Use in Children:** Tenuate is not recommended for use in children under 12 years of age.

PRECAUTIONS: Caution is to be exercised in prescribing Tenuate for patients with hypertension or with symptomatic cardiovascular disease, including arrhythmias. Tenuate should not be administered to patients with severe hypertension. Insulin requirements in diabetes mellitus may be altered in association with the use of Tenuate and the concomitant dietary regimen. Tenuate may decrease the hypotensive effect of guanethidine. The least amount feasible should be prescribed or dispensed at one time in order to minimize the possibility of overdosage. Reports suggest that Tenuate may increase convulsions in some epileptics. Therefore, epileptics receiving Tenuate should be carefully monitored. Titration of dose or discontinuance of Tenuate may be necessary.

ADVERSE REACTIONS: **Cardiovascular:** Palpitation, tachycardia, elevation of blood pressure, precordial pain, arrhythmia. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride. **Central Nervous System:** Overstimulation, nervousness, restlessness, dizziness, jitteriness, insomnia, anxiety, euphoria, depression, dysphoria, tremor, dyskinesia, mydriasis, drowsiness, malaise, headache, rarely psychotic episodes at recommended doses. In a few epileptics an increase in convulsive episodes has been reported. **Gastrointestinal:** Dryness of the mouth, unpleasant taste, nausea, vomiting, abdominal discomfort, diarrhea, constipation, other gastrointestinal disturbances. **Allergic:** Urticaria, rash, ecchymosis, erythema. **Endocrine:** Impotence, changes in libido, gynecomastia, menstrual upset. **Hematopoietic System:** Bone marrow depression, agranulocytosis, leukopenia. **Miscellaneous:** A variety of miscellaneous adverse reactions has been reported by physicians. These include complaints such as dyspnea, hair loss, muscle pain, dysuria, increased sweating, and polyuria.

DOSE AND ADMINISTRATION: Tenuate (diethylpropion hydrochloride): One 25 mg tablet three times daily, one hour before meals, and in mid-evening if desired to overcome night hunger. Tenuate Dospan (diethylpropion hydrochloride) controlled-release: One 75 mg tablet daily, swallowed whole, in mid-morning. Tenuate is not recommended for use in children under 12 years of age.

OVERDOSAGE: Manifestations of acute overdosage include restlessness, tremor, hyperreflexia, rapid respiration, confusion, assaultiveness, hallucinations, panic states. Fatigue and depression usually follow the central stimulation. Cardiovascular effects include arrhythmias, hypertension or hypotension and circulatory collapse. Gastrointestinal symptoms include nausea, vomiting, diarrhea, and abdominal cramps. Overdose of pharmacologically similar compounds has resulted in fatal poisoning, usually terminating in convulsions and coma. Management of acute Tenuate intoxication is largely symptomatic and includes lavage and sedation with a barbiturate. Experience with hemodialysis or peritoneal dialysis is inadequate to permit recommendation in this regard. Intravenous phenolamine (Regitine®) has been suggested on pharmacologic grounds for possible acute, severe hypertension, if this complicates Tenuate overdosage.

Merrell

9 4672 (Y957A)

**Overweight may not always be simple...
complications can develop*.
Complicated or not...**

Tenuate[®] Dospan[®] ^{IV} **(diethylpropion hydrochloride NF)** **75 mg. controlled-release tablets**

A useful short-term adjunct in an indicated weight loss program.

Overweight patients in certain diagnostic categories often require strict appetite control and a successful program of weight reduction may tend to diminish the incidence or severity of the complications in some patients. Diethylpropion hydrochloride has been reported useful in such patients and while it is not suggested that Tenuate itself in any way reduces the complications of overweight, it may have a useful place as a short-term adjunct in a prescribed dietary regimen. **Tenuate should not be administered to patients with severe hypertension; see additional Warnings and Precautions on the opposite page.**

In uncomplicated overweight.

Many patients, on the other hand, present with excess fat but no disease. While this condition is often termed uncomplicated obesity, complications of both a social and a psychologic nature may be distressingly real for the patients. In these cases, a short-term regimen of Tenuate can help reinforce your dietary counsel during the important early weeks of an indicated weight loss program.

Clinical effectiveness.

The anorectic effectiveness of diethylpropion hydrochloride is well documented. No less than 16 separate double-blind, placebo-controlled studies attest to its usefulness in daily practice.¹ And the unique chemistry of Tenuate provides "...anorectic potency with minimal overt central nervous system or cardiovascular stimulation."² Compared with the amphetamines, diethylpropion has minimal potential for abuse.

**Tenuate—it makes sense.
And it's responsible medicine.**

*Studies have shown that obesity is associated with an increased incidence of hypertension, symptomatic heart disease, adult-onset diabetes, and other diseases.

Merrell

For prescribing information see opposite page.

Important data on the pain of acute cystitis:

In 87% of patients studied (303 of 349), Azo Gantanol® reduced pain and/or burning within 24 hours*

A controlled, multicenter study assessed the efficacy of Azo Gantanol in relieving pain and/or burning associated with acute urinary tract infection in patients with at least 100,000 colonies per ml of a sulfonamide-sensitive organism, usually *E. coli*. In 87% of patients with initial symptoms rated "moderate to severe," Azo Gantanol therapy resulted in improvement within 24 hours.

Fast pain relief plus effective antibacterial action

Azo Gantanol®

Each tablet contains 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl.

for
the pain

for
the pathogens

Before prescribing, please consult complete product information, a summary of which follows. **Indications:** In adults, urinary tract infection complicated by pain (primarily pyelonephritis, pyelitis and cystitis) due to susceptible organisms (usually *E. coli*, *Klebsiella-Aerobacter*, *Staphylococcus aureus*, *Proteus mirabilis*, and, less frequently, *Proteus vulgaris*) in the absence of obstructive uropathy or foreign bodies. **Not:** fully coordinate *in vitro* sulfonamide sensitivity tests with bacteriologic and clinical response. aminobenzoic acid to follow-up culture media. Increasing frequency of resistant organisms may reduce the usefulness of antibacterials including sulfonamides. Measure sulfonamide blood levels; variations may occur; 20 mg/100 ml should be maximum total level.

Contraindications: Children below age 12; sulfonamide hypersensitivity; pregnancy at term during nursing period; because Azo Gantanol contains phenazopyridine hydrochloride it is contraindicated in glomerulonephritis, severe hepatic uremia, and pyelonephritis of pregnancy with disturbances.

Warnings: Safety during pregnancy not established. Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been reported and early clinical signs (throat, fever, pallor, purpura or jaundice) may indicate serious blood disorders. Frequent CBC and urinalysis with microscopic examination are recommended during sulfonamide therapy.

Precautions: Use cautiously in patients with impaired renal or hepatic function, severe allergic bronchial asthma; in glucose-6-phosphate dehydrogenase-deficient individuals in whom dose-related hemolysis may occur. Maintain adequate fluid intake to prevent crystalluria and stone formation.

Adverse Reactions: *Blood dyscrasias* (agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia); *allergic reactions* (erythema multiforme, skin eruptions, Stevens-Johnson syndrome, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis); *G.I. reactions* (nausea, emesis, abdominal pain, hepatitis, diarrhea, anorexia, pancreatitis and stomatitis); *CNS reactions* (headache, peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo and insomnia); *miscellaneous reactions* (drug fever, chills, toxic nephrosis with oliguria and anuria, periarthritis nodosa and L. E. phenomenon). Due to certain chemical similarities with some goitrogens, uretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused instances of goiter production, diuresis and glycemia. Cross-sensitivity with these agents exists.

Dosage: Azo Gantanol is intended for the acute painful phase of urinary tract infections. **Usual adult dosage:** 2 Gm (4 tabs) initially, then 1 Gm (2 tabs) B.I.D. for up to 3 days. If pain persists after relief of pain has been obtained, continued treatment with Gantanol (sulfamethoxazole) should be considered.

NOTE: Patients should be told that the orange dye (phenazopyridine HCl) will color the urine. **Supplied:** Tablets, red, film-coated, each containing 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl—bottles of 100 and 500.

ROCHE

Roche Laboratories
Division of Hoffmann-La Roche
Nutley, New Jersey 07110

Before prescribing, please consult complete product information, a summary of which follows:

The effectiveness of Valium (diazepam) in long-term use, that is, more than 4 months, has not been assessed by systematic clinical studies. The physician should periodically reassess the usefulness of the drug for the individual patient.

Contraindications: Tablets in children under 6 months of age; known hypersensitivity, acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: As with most CNS-acting drugs, caution against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Withdrawal symptoms (similar to those with barbiturates, alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal/muscle cramps, vomiting, sweating). Keep addiction-prone individuals (drug addicts or alcoholics) under careful surveillance because of predisposition to habituation/dependence.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations, as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

ORAL. Advise patients against simultaneous ingestion of alcohol and other CNS depressants.

Not of value in treatment of psychotic patients; should not be employed in lieu of appropriate treatment. When using oral form adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increase in dosage of standard anticonvulsant medication, abrupt withdrawal in such cases may be associated with temporary increase in frequency and/or severity of seizures.

INJECTABLE: To reduce the possibility of venous thrombosis, phlebitis, local irritation, swelling, and, rarely, vascular impairment when used I.V.: inject slowly, taking at least one minute for each 5 mg (1 ml) given; do not use small veins, i.e., dorsum of hand or wrist; use extreme care to avoid intra-arterial administration or extravasation. Do not mix or dilute Valium with other solutions or drugs in syringe or infusion flask. If it is not feasible to administer Valium directly I.V., it may be injected slowly through the infusion tubing as close as possible to the vein insertion.

Administer with extreme care to elderly, very ill, those with limited pulmonary reserve because of possibility of apnea and/or cardiac arrest; concomitant use of barbiturates, alcohol or other CNS depressants increases depression with increased risk of apnea; have resuscitative facilities available. When used with narcotic analgesic eliminate or reduce narcotic dosage at least 1/3, administer in small increments. Should not be administered to patients in shock, coma, acute alcoholic intoxication with depression of vital signs.

Has precipitated tonic status epilepticus in patients treated for petit mal status or petit mal variant status.

Withdrawal symptoms (similar to those with barbiturates, alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal/muscle cramps, vomiting, sweating). Keep addiction-prone individuals under careful surveillance because of predisposition to habituation/dependence. Not recommended for OB use.

Efficacy/safety not established in neonates (age 30 days or less); prolonged CNS depression observed. In children, give slowly (up to 0.25 mg/kg over 3 minutes) to avoid apnea or prolonged somnolence, can be repeated after 15 to 30 minutes. If no relief after third administration, appropriate adjunctive therapy is recommended.

Precautions: If combined with other psychotropics or anticonvulsants, carefully consider individual pharmacologic effects—particularly with known compounds which may potentiate action of Valium (diazepam), i.e., phenothiazines, narcotics, barbiturates, MAO inhibitors and antidepressants. Protective measures indicated in highly anxious patients with accompanying depression who may have suicidal tendencies. Observe usual precautions in impaired hepatic function; avoid accumulation in patients with compromised kidney function. Limit oral dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation (initially 2 to 2½ mg once or twice daily, increasing gradually as needed or tolerated).

INJECTABLE Although promptly controlled, seizures may return; readminister if necessary; not recommended for long-term maintenance therapy. Laryngospasm/increased cough reflex are possible during peroral endoscopic procedures; use topical anesthetic, have necessary countermeasures available. Hypotension or muscular weakness possible, particularly when used with narcotics, barbiturates or alcohol. Use lower doses (2 to 5 mg) for elderly/debilitated.

Adverse Reactions: Side effects most commonly reported were drowsiness, fatigue, ataxia. Infrequently encountered were confusion, constipation, depression, diplopia, dysarthria, headache, hypotension, incontinence, jaundice, changes in libido, nausea, changes in salivation, skin rash, slurred speech, tremor, urinary retention, vertigo, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances and stimulation have been reported, should these occur, discontinue drug.

Because of isolated reports of neutropenia and jaundice, periodic blood counts, liver function tests advisable during long-term therapy. Minor changes in EEG patterns, usually low-voltage fast activity, have been observed in patients during and after Valium (diazepam) therapy and are of no known significance.

INJECTABLE Venous thrombosis/phlebitis at injection site, hypoactivity, syncope, bradycardia, cardiovascular collapse, nystagmus, urticaria, hiccups, neutropenia.

In peroral endoscopic procedures, coughing, depressed respiration, dyspnea, hyperventilation, laryngospasm/pain in throat or chest have been reported.

Management of Overdosage: Manifestations include somnolence, confusion, coma, diminished reflexes. Monitor respiration, pulse, blood pressure; employ general supportive measures, IV fluids, adequate airway. Use levetiracetam or metaraminol for hypotension, caffeine and sodium benzoate for CNS-depressive effects. Dialysis is of limited value.

Supplied: Tablets, 2 mg, 5 mg and 10 mg, bottles of 100 and 500; Tel-E-Dose* (unit dose) packages of 100, available in trays of 4 reverse-numbered boxes of 25, and in boxes containing 10 strips of 10; Prescription Paks of 50, available singly and in trays of 10. Ampuls, 2 ml, boxes of 10, Vials, 10 ml, boxes of 1; Tel-E-Ject* (disposable syringes), 2 ml, boxes of 10. Each ml contains 5 mg diazepam, compounded with 40% propylene glycol, 10% ethyl alcohol, 5% sodium benzoate and benzoic acid as buffers, and 1.5% benzyl alcohol as preservative.

Picture yourself as an Air Force Physician

Consider an excellent income without overhead cost or red tape. Thirty days of paid vacation each year. Associates to care for your patients while you're away. Continued professional education. An income that continues if you're ill. Medical care for yourself and your family. And, if you qualify, a lifetime retirement income equivalent to half your base salary after only 20 years of active duty.

Additionally, well-equipped and well-staffed hospitals and clinics provide an excellent environment for your profession. And we know that's important to you.

Put yourself in the picture of good health care in the Air Force Medical Service.

A character all its own.

Valium (diazepam/Roche) is a benzodiazepine with a character all its own.

Pharmacologically, it is a potent skeletal muscle relaxant and anticonvulsant (in adjunctive use), as well as an antianxiety agent. Pharmacokinetically, only Valium provides active diazepam as well as the active metabolites 3-hydroxydiazepam, desmethyldiazepam and oxazepam.

But the individual character of Valium is even more apparent clinically than pharmacokinetically. And far more significant. That's because of the patient response obtained with Valium. A response which brings a calmer frame of mind. A response which has a pronounced effect on the somatic symptoms of anxiety, particularly muscular tension. A response which helps the patient feel more like himself again because of the way Valium reduces the overwhelming symptoms of anxiety and psychic tension.

Another important aspect of the clinical character of Valium is safety. Though drowsiness, ataxia and fatigue are possible, these and more serious side effects are rarely a problem. Of course, as with all CNS-acting drugs, patients taking Valium should be cautioned against driving, operating dangerous machinery or the simultaneous ingestion of alcohol.

Unquestionably, many psychotherapeutic agents, including other benzodiazepines, have antianxiety effects. But one fact remains: you get a certain kind of patient response with Valium. It's a response you want. A response you know. A response you trust as part of your overall management of anxiety and psychic tension.

Valium®
diazepam/Roche
2-mg, 5-mg, 10-mg scored tablets
**a prudent choice in psychic
tension and anxiety**

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology; spasticity caused by upper motor neuron disorders; athetosis; stiff-man syndrome; convulsive disorders (not for sole therapy).

The effectiveness of Valium (diazepam/Roche) in long-term use, that is, more than 4 months, has not been assessed by systematic clinical studies. The physician should periodically reassess the usefulness of the drug for the individual patient.

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. **Adults:** Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. **Geriatric or debilitated patients:** 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) **Children:** 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in trays of 4 reverse-numbered boxes of 25, and in boxes containing 10 strips of 10; Prescription Paks of 50, available singly and in trays of 10.

If you are the trustee of your own Pension or Profit-Sharing Plan you could be making a mistake.

The Pension Reform Act makes trustees personally liable for acts in violation of this statute. A trustee, for example, can be sued for mistakes in plan administration or for errors of judgment in investment management.

Let's face it. Physicians normally are simply too busy being physicians to devote the proper amount of time to their retirement plans. Congress obviously knew this, because one of the major purposes of the Pension Reform Act was to make the management of Pension and Profit-Sharing Plans the responsibility of competent professionals.

First National serves as trustee for a variety of retirement plans, including those of incorporated physicians.

So we ask: from one professional to another, doesn't it make good sense to let a professional perform what he does best?

Call Mr. James Neal at (301) 244-4607, for details.

National Diagnostics Data Corporation
has developed a new, innovative Space Age
Computer System known as
PMC™ — Personal Medical Computer.

**ONCE YOU START USING PMC™, YOU WON'T KNOW HOW
YOU EVER DID WITHOUT IT!**

pmc™ CAPABILITIES

- Patient billing and insurance form print-outs
- Medical record maintenance
- Electronic storage of personal reprint files
- Word processing system
- Telephone option package connected to Dow Jones
- Immediate communication with 10 major data bases of world's medical literature
- Incoming phone call coordinator and automatic outgoing call system
- Full library of soft ware including personal financial planning, taxes, continuing education, statistics and utilities, all in full color

PURCHASE PRICE — UNDER \$9,500
MONTHLY LEASE/PURCHASE PLAN — \$175

— The “**New Generation Computer**” was developed for the field of electronic medicine to increase professional effectiveness and provide more comprehensive patient care. Full training provided. Nationwide service and maintenance available.

Primary Alcoholism Treatment Program

By SANDRA HATHAWAY-HILL, R.N. and L.R. ALLEN

Ms. Hathaway-Hill is Director of the Primary Alcoholism Treatment Program, 1105 E. Fayette St., Baltimore, MD and Mr. Allen resides at 5254 Pine Bark Ct., Columbia, MD 21045. Contact Ms. Hathaway-Hill for reprint and other data.

•

The Primary Alcoholism Treatment Program (PATP) is designed to provide service to indigent alcoholics on a large scale, cost-effective, community-based setting. The building is located at 1105 E. Fayette St. Baltimore. This is one and one-half blocks from one of Baltimore's "skid row" areas, is also near the waterfront and surrounded by several large urban renewal housing projects. This setting makes the program within easy access of the inner city hospitals, mental health clinics, other alcohol and drug abuse programs, the police and community at-large.

The program components include medical transportation and street rescue, screening and evaluation, short-term observation, referral counseling, inpatient detoxification services, individual and group counseling, aftercare planning and follow-up. These services are provided 24 hours per day, seven days per week by a staff of professionals and para-professionals with three Medical Doctors on contract who make daily rounds through the facility. Patients are received in the facility from a variety of sources. The majority (approximately 38%) are referrals from hospitals, social welfare organizations or other community programs. Some 30% are self-referrals (walk-ins). Approximately 17% are brought in by police, and another 15% are brought in by the program's own street rescue unit, known as "Project Good Samaritan." The street rescue unit also responds to requests from the police.

The facility has a total of 32 beds and can accommodate both male and female patients. The average daily patient load is 34, so they are often operating at capacity or better. The average patient length of stay is five-six days. In Fiscal Year 1978 there were 6,750 units of service provided by the program. This figure, using one year's data, includes initial visits as well as return visits by the patients; 63.35% or 1,689 patients out of 2,666, did not return after their first visit. Some 878 patients made from two to 10 visits to the program. This represents approximately 32.9%, while one individual made as many as 46 visits to the program during the year.

The current patient mix reflects both the skid row population as well as the community in which the program is located.

All patients who present themselves for care are medically screened and encouraged to accept medical detoxification when appropriate. If acutely intoxicated, the patient is placed in a protected environment, a

short-term observation unit under medical supervision, until sober enough to be admitted to the medical unit. The majority of the patients put in the short-term observation unit are referred by the police.

Patients determined in need of medical detoxification, or who are in distress from the effects of chronic alcoholism, are admitted to the PAT Unit. They receive compassionate, non-judgmental care by a team made up of both medical and counseling staff. The patient is given a thorough medical evaluation and medication to help relieve the pain of the alcohol-withdrawal syndrome. While the patient is under medical review, an effort is made to consolidate medical treatment and to involve him/her in the appropriate resource for the patient's continuing medical care, thus providing a source for consolidation of treatment and of records of medical treatment.

Patient care is coordinated by the medical and counseling staff with patient participation to develop a treatment plan which will be most beneficial. This includes an aftercare plan with a follow-up record. The patient is given differing degrees of responsibility for follow-up reporting. Treatment plans are written into the client's permanent records, spelling out the method by which the program staff will provide support to assist the patient in aftercare plans.

Patients who are not in need of immediate acute medical care, or who do not wish and/or need detoxification, are offered the benefit of counseling to develop a treatment plan. When a plan has been agreed upon by both patient and counselor, disposition is made. In cases where the patients are to be referred to other treatment services, the counselor will arrange for the patients to be transported to the referral service as soon as possible. A request for follow-up information is sent to the treatment programs used as referral sources, and the follow-up information becomes a part of the patient's permanent record, thus allowing for better continuity of care should the person return to the PATP.

Another important element of the program is the "soup kitchen," which provides soup and sandwiches to the patients, or the "nutritional support," since it does provide the badly-needed nutrition to those who have been drinking and neglecting their diet.

This program is at the "hub" of the wheel of various community resources available to help the alcoholic recover. □

The Open Forum

"Misperception"

I would like to take this opportunity to correct a misperception held by Dr. Sandra Z. Salan in her editorial comment on the article by Drs. Kushner, Richardson and Shilder, **Carotid Endarectomy in a Small Community Hospital: A Team Approach**, in your July, 1979 issue.

Dr. Jack Kushner, Board Certified in Neurology and Neurosurgery, was the surgical team leader in the cases presented, and Dr. Gary Richardson, a cardiovascular surgeon, his surgical assistant. Dr. Peter Shilder, a Board Certified Neurologist, saw each of these patients either as primary physician or on consultation. In all cases, each of these patients was seen by **all three** physicians.

Therefore, as these were the members of the team who worked together on **each** of the patients in the role as described above, the conclusion that "if-evenly-split, no surgeon did more than four of the procedures in that hospital per year" is misleading and inaccurate.

1980 State Journal Conference To Be Held in Baltimore

The State Medical Journal Advertising Bureau, Inc.—whose membership comprises the 33 states (including Maryland) nationally that publish state medical journals—will hold its annual conference in Baltimore on Sept. 19-21, 1980 to coincide with the famed Baltimore City Fair, now in its 11th year.

The Conference Program Chairman will be **Journal** Managing Editor Blaine Taylor, who chaired the recent 1979 Conference at Goat Island, Newport, R.I. Taylor, 32, at the **Journal** since 1974, was also recently elected to the SMJAB Board of Directors as the only Managing Editor so serving.

The Newport SMJAB program included such renowned speakers as Dr. Arnold S. Relman, Editor of the **New England Journal of Medicine**; David A. E. Shephard, MD, President-Elect of the American Medical Writers Association; Dr. Stanley M. Aronson, Dean of the Brown University School of Medicine; Fred Fabro, MD, Editor of **Connecticut Medicine**; Victor S. Falk, MD, Editor of the **Wisconsin Medical Journal**; Gerold L. Schiebler, MD, Editor of the **Journal of the Florida Medical Association**, as well as various non-MD Assistant and Managing Editors from different states.

The 1980 meeting marks the first time the SMJAB group has met in Baltimore.

AN EXTENSION OF HOPE FOR THE ALCOHOLIC

HIDDEN BROOK BEL AIR

Established 1968

We are pleased to announce the opening of Hidden Brook at Warwick. This is a major new enlargement of our capacity for the treatment of alcoholics ...an expansion of 20 additional beds to the 39 already at Bel Air. Beautifully situated on the waterfront of the Warwick River near Secretary, Maryland in Dorchester County...the total environment is peaceful and ideally conducive to rehabilitation. The program, philosophy and rates of Hidden Brook at Warwick will be identical and interchangeable in every respect with the program at Hidden Brook, Bel Air. Request our brochure. Write or phone for information.

In Memoriam: Carol Conners Broaddus, 1919-79

President, Auxiliary to the Medical
and Chirurgical Faculty of Maryland, 1977-78

It's almost impossible to realize that less than three months ago our beloved Carol Broaddus was a healthy and vigorous woman. She died of cancer in the early morning hours of Aug. 8, 1979 at the Johns Hopkins Hospital.

Carol was a native of Shaker Heights, OH. She received her bachelor's degree in biology from Duke University and her master's degree in biochemistry at the Case Western Reserve University School of Medicine.

Her husband, Dr. Robert E. Broaddus, whom she married in 1943, has a private psychiatric practice in Havre de Grace, MD. Dr. Broaddus was formerly with the US Army Medical Corps.

Besides her husband, she is survived by four sons, Robert Eugene of London, England; James Conners of New York, John Hale of Grand Rapids, MI and William Clendenin of Cleveland, OH; one daughter, Julia Anna of Romney, WV; one sister, Eileen Becker of Cleveland Heights, OH and two granddaughters.

The above vital statistics do not tell the kind of woman Carol was, or the quality of life she led. God endowed Carol with a brilliant mind, many talents and boundless energy. She used them all unstintingly for the benefit of others. Carol was a natural leader and organizer because she had keen insight and confidence in those with whom she worked.

Bob and Carol were a devoted and loving team. They supported each other in all undertakings. When they were separated because of Bob's overseas duty, Carol was the strength, stability and guiding light for him and their children. During one of Bob's tours of duty, they spent three years in Korea where Carol helped to found the Korean-American student exchange program and also the Korean Red Cross Volunteers. Throughout Bob's Army career, Carol was active in Officers' Wives' Clubs and other organizations pertinent to the service. While stationed at the Aberdeen Proving Grounds, Carol served as President of the Officers' Wives' Club and was instrumental in founding that group's scholarship for military dependants at Harford Community College, where she also taught microbiology in 1976. She had served as President of the Retired Officers' Wives' Club in Harford County and was President-Elect of that group at the time of her death. Carol served three terms as President of the Auxiliary to the Harford County Medical Society. During her tenure, she established immunization and cardiopulmonary resuscitation programs and worked in fundraising for AMA-ERF and the Health Careers' Scholarship fund at the local community college. As a lasting tribute to Carol, the Auxiliary to the Harford County Medical Society is renaming the Health Careers' Scholarship "The Carol Conners Broaddus Scholarship." At the National Convention, in July, Harford

County received the AMA-ERF award for the largest contribution per capita of the counties in the Eastern Region. This award is another tribute to Carol's enthusiasm and efforts.

When Carol began to work with the Auxiliary on the state level, everyone knew she would soon become our President. She served the Auxiliary in many capacities, from County to State President, and the job was always done in her quiet, unassuming manner. Carol firmly believed that all physicians' wives should belong to the Auxiliary and encouraged them to join and participate in its activities.

Carol Broaddus never met a stranger—there was always that big smile and sincere greeting to young and old, friend or stranger. She had great love for all people and a deep sensitivity for their feelings. These qualities would not permit her to do or say anything unkind. She abhorred gossip and saw only the redeeming qualities in her friends and associates. Carol could be firm, if neces-

MRS. BROADDUS
Photo by Judy Buck.

sary, but this was always tempered with gentle understanding.

Carol faced her final months of life as she had lived—patient, uncomplaining and with more concern for her family and friends than for herself. At the end, she was with her beloved Bob and their devoted children. This dear, gentle lady had a short, but wonderful, life and those of us whose lives she touched shall never forget her and will always remember her with love.

Your Medical Faculty At Work

JOHN SARGEANT, CAE, Executive Director

Executive Committee

The Executive Committee met on Sept. 6, 1979 and took the following actions:

1. Heard a presentation from Lou Orsini of the Health Insurance Association of American, regarding a proposal of the Maryland Health Care Coalition, with respect to review of quality in-patient hospital care and suggested he speak to the Council in this regard.

2. Heard a report from one of the Faculty representatives of the Maryland Hospital Association's Task Force on the same subject (quality of inpatient hospital care) and requested the three Faculty representatives be present at the same Council session, Sept. 29, 1979, to make a progress report in this area.

3. Determined that the above subject would be discussed in depth at the October Executive session with a view towards establishing some policy in this area.

4. Requested the Program and Arrangements Committee to designate some portion of the 1980 Annual Meeting to honor Nobel Prize Winners David Nathans, MD and Hamilton O. Smith, MD.

5. Submitted the name of Frederick O. Miltenberger, MD of Cumberland for another term on the statewide PSRO Council.

6. Adopted the House of Delegates Minutes of May 2 and 5, 1979.

7. Approved the location of the 1980 Annual Session and dates as follows: Baltimore Convention Center, Apr. 23-25, 1980.

8. Approved loan of some historical material for the month of October to the Baltimore Hebrew Congregation subject to the usual caveats in this regard.

9. Authorized attendance of two persons at the CME meeting in Chicago in October, 1979.

10. Approved purchase of a word processor as recommended by staff.

11. Approved 1980 Executive Committee meeting dates.

12. Declined to provide continued financial assistance to the son of a deceased physician because of lack of education progress.

13. In Executive Session, reviewed the Personnel Wage and Salary Study, but deferred final action until a later Executive Committee session. □

Council

The Council met on Sept. 29, 1979 and took the following actions:

1. Approved waiver of 1979 dues on account of illness for an individual member at the request of the component society.

2. Established 1980 Council meeting dates.

3. Urged Council members to submit nominees for various AMA Councils and Committees, as well as for the AMA Awards that are presented at the Annual 1980 Meeting of the AMA House of Delegates.

4. Agreed to cosponsor a Seminar on Risk Management with the Medical Mutual Liability Insurance Society.

5. By acclamation, approved support of Russell S. Fisher, MD as a candidate for a seat on the AMA Board of Trustees.

6. Deferred action on a proposed research study by the Montgomery County Maryland Medical Care Foundation that would look into physician job satisfaction.

7. Accepted two portraits from individuals in Maryland; one of Daniel Coit Gilman, and the other of Reverdy M. Hall, MD, first black physician to be admitted to membership in the Faculty in 18

8. Referred to the Executive Committee a question dealing with some written document that would specifically state the Workmen's Compensation Fee Guide is that, and not a fixed schedule of fees. Legal counsel will be brought into this discussion and a report made to a future Council session.

9. Deferred for further information the question of financial assistance being given to a proposed Seminar on Women in Medicine to be presented in 1980 at the University of Maryland School of Medicine.

10. Learned of the success of a corporate visitation program being conducted by Council Chairman and the President who are discussing with business and industry questions these groups have on health care and the costs related thereto.

11. Referred to the Executive Committee the question of provision of legal defense funds for physicians when acting in areas of peer review, fee review and ethics and from which suit is entered against the individuals and the components and requested a report to the November, 1979 Council meeting.

12. Received a report of the Ad Hoc Committee on HMOs, the full text of which is printed herewith. Took action by referral of Recommendations Two and Four to legal counsel for advice; referral of Recommendation Three to the Ad Hoc Committee for clarification; referral of recommendation Five to the Peer Review Committee for its consideration and action if deemed necessary; referral of Recommendation Seven to the Legislative Committee for implementation; referral of Recommendation Eight to the Public Relations Committee for review and recommendation, together with costs of such action.

13. Deferred action on a request of the Maryland Health Care Coalition in connection with concurrent review of hospitalized patients; pending receipt of the final report of the Maryland Hospital Association Task Force on Quality Patient Care, which is reviewing mechanisms to assure Quality Assurance for in-hospital patients. The Executive Committee plans to consider this at some length at its October, 1979 meeting, the Council was advised.

Report of Ad Hoc Committee on HMOs to Council

Information which has been gathered in the past

*TENTH ANNUAL
BOARD REVIEW AND REFRESHER COURSE*

INTERNAL MEDICINE 1980

Sponsored By:

**The Department of Medicine, Maryland General Hospital
and
The Department of Medicine, University of Maryland
School of Medicine**

Time: Jan. 16, through May 28, 1980, 5:30-7:30 PM
20 consecutive Wednesday evenings

Place: Maryland General Hospital Auditorium
827 Linden Avenue
Baltimore, Maryland 21201

Fee: Practicing Physicians \$95
House Staff \$50
(includes tuition, outlines, binder, snacks)

The course is designed to aid the physician preparing for the Certifying Examination in Internal Medicine and to be of value to the practicing physician. 40 hours credit for relicensure, Maryland State Board of Medical Examiners and AMA Physicians Recognition Award, Category I.

For Further Information Contact:

**DEPARTMENT OF MEDICINE
MARYLAND GENERAL HOSPITAL
827 LINDEN AVENUE
BALTIMORE, MARYLAND 21201
PHONE (301) 728-7900 EXT. 2413**

few months by this Committee was reviewed and discussed, after which it was agreed a draft of a report to be made to Council would be prepared.

1. Having reviewed Federal and State statutes covering HMOs, it seems that Maryland's law is very nearly a carbon copy of the Federal statute and attempts to make changes in the statute at this time would be futile.

Recommendation: Physicians in Maryland should understand that HMOs are a fact of life, and do have a place in the various modalities of health care delivery. The Faculty took the following position in 1970:

The Faculty supports the concept that medical care can be delivered through various mechanisms, including closed panel programs; provided individual physicians render such health care on an equitable basis and further provided that the patient has the right to choose the mechanism through which he will receive such health care.

The Faculty's position on this matter should be reaffirmed.

2. One area of concern is the issue of advertising. The State Annotated Code provides that no HMO may be prevented from advertising its services or non-professional aspects of its operation, but cannot make any qualitative statements or misleading statements. For example, an HMO may make the statement, "We have a better plan," but it cannot state that it has better doctors. The Faculty's position on advertising in the past has been simply that physicians could not advertise except as defined by the Board of Medical Examiners. The Board has recently revised the regulations, and is awaiting the signature of the Secretary of Health and Mental Hygiene. These regulations will deal more specifically with ways the physician may advertise; however, the law dealing with HMOs permits advertising and even door-to-door solicitation which individual physicians are not permitted to do. Therefore, there may be a conflict between the State HMO law and regulations of the Board of Medical Examiners.

Recommendation: Legal counsel should be directed to study both the HMO laws (Federal and State) and the proposed regulations of the Board of Medical Examiners to determine whether there is direct conflict between how a physician in private practice may advertise and how an HMO may advertise on behalf of individual physicians.

3. The Committee expressed concern that patients enrolled in HMOs may sometimes be either confused or actually misled about the level of care they are receiving. That is, more extensive use of para-professionals is made in HMO's than in private physicians' offices. In addition, they are not always aware of the range of benefits being offered.

Recommendation: Some attempt should be made to require HMOs, when advertising their services, to let the prospective patients know that part of their care might be delivered by a Physician Assistant, Nurse Practitioner, etc. rather than a physician. This may or may not reflect on the quality of care given the patient, but in any case, the patient should have knowledge of who will render the care. In addition, prospective patients should be made aware of what services they are entitled to; i.e., emergency services are sometimes available only

with prior approval. Furthermore, the Maryland General Assembly passed a bill in the last session which would allow insurance carriers to offer hospitalization only as an option in prepaid plans. Full range of benefits is therefore not always included in HMO contracts.

4. Every employer with 25 or more employees must give employees the option of joining an HMO as part of its health benefits. This gives the HMO the healthiest segment of the population from which to draw its patients. This, of course, results in more favorable statistics for the HMO. Since contractual arrangements with HMOs are almost always with groups, it naturally follows that relatively healthy, employed people will comprise the largest number of members of any HMO; however, this Committee is concerned that the portion of the population most in need of care may still be neglected.

Recommendation: While the law states that HMOs must offer services to all segments of the population, it is doubtful that that segment most in need of such care is very actively solicited. A period of open enrollment, well-publicized, should be required through an amendment to State law if necessary.

5. The Committee was also concerned about the quality of care within the HMO. While Federal and State law require a monitoring mechanism for quality assurance, there is really no assurance that such a mechanism is in place or that it is effective.

Recommendation: That the Faculty take some action, possibly through its Peer Review Committees, to investigate the means by which such monitoring of care is accomplished.

6. In discussion with a Blue Cross representative who attended one of the Committee meetings, it was learned that statistics to date indicate that not more than 20% of the population has turned to HMOs for their care. This would be about the maximum that can be expected. Blue Cross has assured us that they feel it is essential to participate in the insurance of this 20% of the population. They are fiduciary advisors, but they are not subsidizing any part of the HMOs, although they do the marketing of certain HMO plans. We have no recommendation to make in this area.

7. It was also noted that Federal funding is available to underwrite new HMOs in the formative stages. This indicates unfair competition with other health care programs. Additionally, a problem is presented if an HMO goes bankrupt. Who pays for services for preexisting conditions? The Blue Cross representative who met the the Committee assured us that Blue Cross would become responsible for the bills for services rendered and coverage reverts back to Blue Cross so that the patient does not lose anything; however, there is no such assurance from other fiduciary agents.

Recommendation: A proposal should be submitted to the Legislature that every HMO established with Federal or State funding be required to share in establishing a reserve fund for the purpose of continuing care for those recipients who are left without coverage in the event of bankruptcy of the HMO. This fund could be established with a certain percentage of gross receipts from each HMO each year.

8. IPAs (Independent Practice Associations) is an option that is open to physicians. Members should be

warned about the financial dangers of such an arrangement since several HMOs are at present in financial difficulty. If HMOs are the wave of the future, we should encourage members of the Faculty to look closely at this mode of practice, be forewarned that it is fraught with danger and restricted by many regulations, but that they should also consider HMOs and IPAs as one mode of practice.

Recommendation: The strongest recommendation of this Committee is to put forth an educational program directed at physicians and the public alike, preferably by professional public relations people, emphasizing the fact that the Faculty supports various modalities of delivery of health care. All types of health care delivery should be discussed, including the advantages and disadvantages of each. In addition, although it has been said many times before, physicians must be told over and over again that they are their own best public relations agents and each physician must polish his own capabilities regardless of which mode of practice he chooses.

Downs on Severn: Located just north of Annapolis on the Severn River, between Brewer and Clements Creeks.

We saved the best for last.

The final section of incomparable homesites at Downs on Severn is now being offered for sale. We saved the best for last: the tip of the spectacular promontory jutting into the beautiful Severn River, only minutes from Annapolis.

As this offer is announced, we are completing a 68 slip marina and a new clubhouse with swimming pool and tennis courts for the exclusive use of the residents of the Downs.

Pick from a wide selection of

waterfront and waterview homesites, of not less than one acre size. Although expensive, they are extraordinary, and, as such, you will want to consider seriously their inclusion in your building plans.

Only 35 minutes from Washington: Beltway to Rt. 50, east to Crownsville turnoff, west on Generals Hwy. (Rt. 178), right on Old Rt. 178, right on Sherwood Forest Rd., right on Coachway to Downs on Severn. Open 7 days a week noon till 5 PM, or call for an appointment.
From Washington: 261-8880,
from Annapolis: 849-8300.

Downs on Severn

One of the last untouched waterfront areas this close to Annapolis.

Executive Director's Newsletter

November, 1979

ADVERTISING

The U.S. Medical Directory is again soliciting physicians with billheads indicating that physicians have appeared previously in the Directory, and urging that physicians complete the form for "the next edition."

ALERT

Members are warned that this is not an endorsed publication by any official organization and, in the opinion of knowledgeable persons, is not of any real value to physicians who may wish to be listed in this publication.

REGULATIONS'

REVISIONS

The Board of Medical Examiners is currently involved in the final draft of regulations governing advertising and solicitation by physicians. After approval by the Board, they will be published in the Maryland Register, a public hearing held and comments received, and finally approved by the Secretary of the Department of Health and Mental Hygiene. All physicians will be kept fully informed as these go through the regulatory process.

In other developments, the status of nurse specialists' regulations is as follows:

Nurse/Anesthetist: Amended and adopted.

Nurse/Midwife: Changed with a substantive amendment and re-scheduled for an additional hearing on Wednesday, November 21, 1979 at the State Office Building, starting at 1:30 PM.

Nurse/Practitioner: Awaiting action by the Secretary of Department.

AMPHETAMINE

REGULATIONS

The state regulations governing the prescribing of amphetamines have recently been revised. This class of drug may only be prescribed for narcolepsy, hyperkinesis or minimal brain damage. Prescription for any other condition must have an authorization number from the Medical Consultant of the Department of Health and Mental Hygiene. Requests for exceptions should be addressed to Sidney B. Seidman, MD, Medical Consultant, 1211 Cathedral Street, Baltimore, Maryland 21201. Full text of the regulations will be published in an early issue of the Maryland State Medical Journal, but a copy may be obtained from the Faculty office in the meantime.

MEMBERSHIP

We are again preparing to randomly survey 20% of our membership to determine your feelings on our work and the benefits offered to you, the members. We cannot urge you strongly enough to complete and return the survey, so we can be more responsive to your needs.

SURVEY

REVISED

MEDICOLEGAL

CODE

The Medicolegal Committee anticipates completion of revisions to the Medicolegal Code of Cooperation by the end of the year. The revised Code will provide guidance to doctors and lawyers on the problems most common to members of the medical/legal community, particularly in regard to requests for medical reports and information, and payment of bills for medical reports. Additionally, the Committee is planning a series of programs on current medical/legal issues, based on the needs and concerns of both professions. The programs are now being developed and will be presented by the Committee or in cosponsorship with other appropriate groups at some future date.

RESOLUTIONS

DEADLINE

Deadline date for receipt of resolutions for consideration at the 1980 annual House of Delegates session is

FRIDAY, FEBRUARY 29, 1980.

Receipt in the Faculty office must be by close of business on that date.

NEW

BOOKLET

In response to increasing inquiries regarding ownership, availability, and rights to review patient medical records, the Faculty has prepared a booklet outlining current legal and ethical requirements in this regard.

Copies may be obtained by contacting the Faculty office, 301-539-0872.

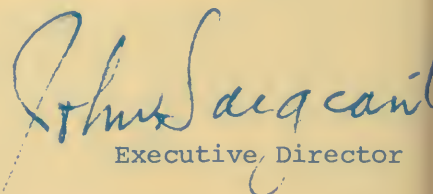

150TH

ANNIVERSARY

OF FACULTY

LIBRARY

The Library and History Committee is planning an appropriate celebration for the 150th anniversary of the founding of the Faculty Library in June of 1980. The June issue of the Journal will be devoted to a history of the library between 1830 and 1980. In addition, the library has recently received several significant donations. The contributions have come, both in the form of cash donations and rare medical books. Where the donated books duplicate those in the Faculty's collection, they are being sold and additional items purchased in the name of the donor. Further contributions are welcome and encouraged.

Money isn't everything.

It's knowing what to do with it that really counts.

Where to invest it. How to make it grow. Get income from it. Minimize risk and taxes.

That's why it pays to have people around you who make it their business to know. Who are investment management experts.

Like the people in the Trust Division at Union Trust Bank.

For the past ten years, our professional managers have consistently outperformed other financial institutions. The pension and profit-sharing funds and individual trusts we've handled have consistently earned top dollar. Our records prove it.

And we're ready to do our best for your portfolio. Now. First, by sitting down together and discussing your plans. Your goals. Your objectives.

Next, we come up with a program custom-fitted to your needs. To your company's future. Or to your family's future.

Then we keep you up to date by phone, personal meetings and newsletters. So you're never out of touch. And we're never out of reach.

If that sounds good to you, we've made it easy for you to get more details on our personal or corporate investment services.

Just call Larry Rosenthal, our man in charge of personal trusts, at 301/332-5515. Or Jay Neale, in charge of employee benefit plans, at 301/332-5877.

What you do with your money is their business.

SCIENTIFIC EXHIBIT APPLICATION

Scientific exhibits are an integral part of the Annual Meeting. All physicians, medical institutions, and organizations having an appropriate exhibit are urged to complete the application below for consideration by the Exhibit Subcommittee.

PLEASE INDICATE THE CATEGORY OF EXHIBIT:

- ☐ **SCIENTIFIC EXHIBIT:** Result of original scientific research which involved the personal contribution of the exhibitor. Its purpose is to advance medical knowledge. It should not be designed for the personal, financial gain of the exhibitor.
EXHIBIT FEE: Waived. Each Space 8' x 10'.
- ☐ **CLINICAL DISPLAY EXHIBIT:** Must be of a scientific nature, but not necessarily original research. The exhibitor need not be personally involved in the research. The exhibit should contribute to the advancement of knowledge of other members of the profession, but it may also contribute to the personal, financial gain of the exhibitor.
EXHIBIT FEE: \$150 for each 8' by 10' space.
- ☐ **EDUCATIONAL:** Any exhibit of a scientific and non-commercial nature which does not fit into either of the above two categories. Included would be voluntary health organizations and local and State agencies.
EXHIBIT FEE: \$60 for each 8' by 10' space.

PLEASE COMPLETE AND SUBMIT BY JAN. 31, 1980

RULES GOVERNING SCIENTIFIC EXHIBITS

1. U-Neek Display is the official decorator for the 1980 meeting, and, upon request, will transport, set up and dismantle an exhibit.
2. If the exhibitor elects to transport, and/or set up and dismantle his/her own exhibit, he/she is then fully responsible for his/her own exhibit.
3. The exhibitor is fully responsible for the content, arrangement and presentation of exhibit.
4. The Medical and Chirurgical Faculty will provide an 8' x 10' booth, back drop and side rails, one covered table and two chairs.
5. ALL ELECTRICAL OUTLETS will be billed directly to exhibitor from the Convention Center and should be ordered through U-Neek Display.
6. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS.
7. No reference to, or credit for, financial aid shall be shown on exhibit.
8. Only generic names may be used. No trade names are permissible.
9. Each exhibit should be manned at all times by someone familiar with its content.
10. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.
11. Inquires should be directed to:
Ms. Mary E. Galeckas at Med-Chi, (301) 539-0872.

In Praise of Hospital Libraries

With today's rapid growth in the volume of medical information, medical libraries have become more than luxurious monuments to the great past of medicine. The medical library is now the common ground between the physician who provides patient care and the universe of medical literature in which the latest modes of diagnosis and treatment are reported. As such, the medical library has become an essential component in the provision of patient care. One measure of the quality of care provided by an individual physician is the use he/she makes of current medical information.

The chapter on professional library services in the **Accreditation Manual** of the Joint Commission for the Accreditation of Hospitals illustrates the importance medical libraries have assumed. In order to receive accreditation, each hospital must provide library support for the information needs of its physicians and staff. The JCAH's principles and its interpretation require that these professional library services be supported by appropriate organization, staff and resources. Also, the library services must be guided by written policies and procedures. According to the JCAH, the hospital library is to have the same status as any other hospital department.

The concept of the importance of hospital medical libraries has been very slow to catch on. At the same time that the JCAH is becoming more concerned with hospital libraries, hospitals are facing pressure to contain, or even reduce, operating costs. Libraries are by no means inexpensive. One fact that is presented over and over again by hospital administrators, and even some physicians, is that Maryland's physicians have the resources of the Med-Chi Library—why does their hospital also need a library? The answer lies in the nature of the physician's information needs. Questions that arise concerning the treatment of patients usually need immediate answers. In most circumstances, if the information sought from a library is to have an effect on patient care, it must be readily available. The hospital library is needed both as an immediate source of health-related information regarding patient care and as a channel for efficiently and quickly obtaining such information from larger resource libraries.

What is more, physicians are not alone in being responsible for patient care; nurses and allied health professionals working in hospitals also have information needs. The Med-Chi Library is set up for, and supported by, the physicians of Maryland, and it does not actively collect resources regarding nursing care or allied health practice. Nurses and allied health practitioners do not have the same access to the Med-Chi Library that physicians do. The modern hospital library is a health sciences library, set up to provide for the information needs of **all** health professionals, not just the medical staff; however, hospital libraries face severe

limitations, both in budget and in space. Even the largest hospital library can only acquire a small proportion of the health-related publications that are available. In selecting publications for purchase, the hospital library must be guided by the needs of its clientele. Each item purchased must be carefully weighed in view of its value to the hospital's physicians and staff. Each hospital library's goal must be to obtain materials that satisfy the immediate needs of physicians and staff.

The hospital library is also the channel connecting the individual physician or health professional and the entire universe of medical information. Thus hospital libraries must be able not only to satisfy the immediate information needs of health professionals, but they must also be able to locate and acquire for their clientele virtually any publication related to health care that may be needed. When information is not available immediately, the hospital librarian may go to other hospital libraries, to a larger resource library such as the Faculty Library or to a university medical school library. If a resource library does not have the required material, the request can be channeled on to the National Library of Medicine; even it cannot make available every medically-related document, and so some requests may be sent on to still other national libraries, such as the British Lending Library.

In all this large informational network, the hospital librarian is the key. If an adequately trained library manager is available, a physician working out of the smallest hospital in Maryland has access to the same materials that are available to any physician practicing at a university medical center. The hospital library's trained manager is the gatekeeper who assures that the results of medical research are accessible to physicians and other health professionals who care for patients on a day-to-day basis.

As hospital libraries become better organized and developed, it is anticipated that the Faculty Library will gradually decrease its functions as a direct channel of medical information to physicians and will assume a supportive, backup role to hospital libraries. Evidence of this evolution can be found in the function Maryland hospital librarians are taking on by providing photocopies of journal articles to Med-Chi members. Most hospital librarians in Maryland are willing to do this, thus serving two purposes: first of all, there is a chance that the material may be available in the hospital library and the requester will not have to wait for it; secondly, it relieves the physician of the need to write or call the Faculty Library. He can stop in at the hospital library and make his request while the topic is on his/her mind, right after he/she has seen the patient.

The Faculty Library can also provide consultative services and support services in the way of acquiring, cataloging and processing of books, journals and au-

Generics save money. Big money!

The FTC estimates that \$400 million could be saved annually on the nation's Rx bill if physicians prescribed generics. Are you saving *your* patients extra dollars?

Purepac, America's leading manufacturer of a national brand of generics, would like to show you the tremendous savings possible with just three of our 700 generic products:

DRUG		AVERAGE RX PRICE (100's)	\$ SAVINGS WITH PUREPAC	% SAVINGS WITH PUREPAC
Pavabid Capsules*	150 mg.	\$10.32		
Purepac Papaverine	150 mg.	3.95	\$6.37	61.7%
Equanil Tablets*	400 mg.	8.15		
Purepac Meprobamate	400 mg.	1.85	6.30	77.3%
Librium Capsules*	10 mg.	8.76		
Purepac Chlordiazepoxide HCl.	10 mg.	3.90	4.86	55.4%

Registered trademarks of Marion Labs., Wyeth Labs., Roche Labs., respectively

Purepac generics save money. Big money. Purepac is dedicated to providing your patients with quality products that are equivalent to their brand name counterparts at significant savings.

But we can't do it alone. We need your cooperation.

Send for Purepac's *free* Brand Name/Generic Name Reference Chart today. You'll receive an alphabetical listing of brand name drugs with their generic counterparts.

And next time you write a prescription, write for Purepac brand generics. Your patients will know you care.

PUREPAC. Competitive prices and peace of mind.

diovisuals, leaving the individual hospital librarian free to work on the "firing line," answering questions and seeing that information is readily available. Because most hospital libraries will never be able to purchase more than essential journal subscriptions and essential reference texts, the Faculty Library will continue to be needed as a backup for other publications that contain needed information, but for which the need is not immediate. This will be especially true of materials needed to support continuing education programs offered by hospitals and materials needed by physicians preparing for specialty board examinations.

As Faculty Librarian, I have seen this trend developing over a long time. Hospital administrators are just beginning to realize that JCAH is now serious about hospital libraries. During the past two years, I have made numerous consultative visits to hospitals throughout Maryland, usually in response to requests by administrators for help to set up libraries to meet the JCAH requirements.

Hospital libraries in Maryland have come a long way in the last two years, but the process has not been easy. The concept of a library as a source of timely, current information—rather than as a storehouse of old books—is difficult to change, and yet the change has come. If you have not visited your hospital library in the last couple of years, it deserves a try.

These are exciting times to be a hospital librarian, as the challenge is great. Skill and insight are required to select for the library materials that will best answer most of the information needs of its clientele. The hospital librarian must know what resources are available in other sections of the hospital, as well as in the library. The librarian must also know what resources are available in other hospitals and in large resource libraries, as well as how to access these resources. All the medical research, and all the publications in which the results of this research are made public, are ultimately aimed at better patient care. The hospital librarian is the point of connection between medical research and the health care professional who must make practical application of the researcher's findings.

JOSEPH E. JENSEN

Horse Riders Urged to Wear Safety Helmets

Tired of jogging for your health? Get a horse. There are more than 10 million horses in the United States, and as many as 82 million Americans will ride a horse at least once during the year, says a recent AMA report.

Some of those riders will be thrown off. They will be stepped on or rolled on by their mount. They will get kicked by a flailing hoof, slashed by rope burns, bitten or lashed by low-hanging tree limbs.

John A. I. Grossman, MD, of the George Washington University Medical Center, in Washington, DC, and colleagues reports on a study of 110 injured equestrians brought to the emergency room of the University of Virginia Medical Center in Charlottesville from central and western Virginia and parts of West Virginia and Tennessee in a recent **JAMA** issue.

The riders were engaged in fox hunting, polo, steep-lechase racing, dressage and racehorse training. Most were amateurs.

There was little pattern as to age, sex or experience of the amateur riders and injury occurrence. Of the 110, there were 76 women and 34 men. Dr. Grossman points out that many more women than men are riders. Ages ranged from 1-64 years. Only 22 of the individuals were admitted to the hospital.

The most common injury was a bump on the head. Almost all of these could be avoided or lessened by wearing helmets, but fewer than 20% of the riders used protective headgear, he says. The second most common injury was a sharp blow to the stomach, with internal injuries. For those who were treated and sent home, broken arms and wrists were the most common injury. The arms are outstretched for protection during a fall.

In addition to wearing of helmets, Dr. Grossman recommends that tack—saddle, stirrups and bridle—be checked carefully and frequently. Some injuries are caused by failure of a strap of cinch.

JAMA Editor William R. Barclay, MD, in an accompanying editorial, pointed out that risk of injury is low for the expert horseman, and a person can participate in equestrian activities even at an advanced age.

"In counseling those who express an interest in equestrian activities, we should emphasize the positive aspects rather than the risks," Dr. Barclay noted.

"As a matter of personal observation, a day's ride on my hunter not only refreshes my spirits, but also seems to relieve the chronic backache that is aggravated by long hours of sitting at the editor's desk." □

HOW TO KILL AN ASSOCIATION

Don't participate beyond paying your dues—let "them" handle things.

Then complain that members have no voice in management.

Decline all offices and committee appointments—you're too busy.

Then offer vociferous advice on how they should do things.

If appointed to a committee, don't work—it's a courtesy appointment.

Then complain because the organization has stagnated.

If you do attend management meetings, don't initiate new ideas.

Then you can play "Devil's Advocate" to those submitted by others.

Don't rush to pay your dues—they're too high anyway.

Then complain about poor financial management.

Don't encourage others to become members—that's selling.

Then complain that membership is not growing.

Don't read the mail from headquarters—it's not important.

Then complain that you're not kept informed.

Don't volunteer your talents—that's ego fulfillment.

Then complain that you're never asked; never appreciated.

And, if by chance, the organization grows in spite of your contributions

Grasp every opportunity to tell the youngsters how tough it was; how hard you worked in the old days to bring the organization to its present level of success.

Medicine in Maryland, 1634–1900

Chapter 15

Editor: Douglas G. Carroll, Jr., MD (1915–1977)

Medical Reforms in Maryland (1848–76)

There were two important socio-medical developments between 1848–76. The first was the remarkable increase in the number of proprietary medical schools throughout the country with a tremendous increase in the number of MDs. The second was the development of various sects, one of the most enduring being the homeopathic physician movement.

In the late 18th and early 19th centuries, a major purpose of the medical societies was the elimination of empirics and quacks from practice. They tried to do this by founding medical schools and controlling licensure within the states. The original impulse for this movement came from the highly-trained European physicians in the Colonies. Elimination of competition and establishment of a monopoly does not seem to have been a major purpose early in the 19th Century. After 1830, however, with the increasing numbers of proprietary medical schools, more and more students of indifferent quality were accepted, and the quality of medical education deteriorated. There was a gradual loss of respect for the medical profession.

The second major movement in the 19th Century was the development of various sects, of which the homeopathic physicians were a major influence. A number of the sects arose from complex philosophical views as to the nature of disease. Homeopathic medicine arose in part as a reaction to the overuse of drugs. In the late 18th and early 19th Centuries, the majority of drugs used produced dramatic effects. Jalap and croton oil produced major diarrhea and dehydration. Phlebotomy was a dramatic operation which the patient could observe and feel. Mercury produced excessive salivation, but the drugs seemed to be used more because they produced an obvious and dramatic effect than for any observed benefit they may have had on the disease process. The use of drugs was based more on dogma than on observation of its effect on the specific patient.

The deterioration of the medical schools and the rise of medical sects were not entirely destructive forces. The increased number of doctors fulfilled the medical needs of a burgeoning population. It would be hard to prove that there was much difference in the effectiveness of the physician trained in the 18th Century from those trained in the middle of the 19th. Indeed, the gradual rejection of the heroics of Rush (cathartics, phlebotomy and mercury) was a step in the direction of allowing nature to heal.

Medical Education

The American Medical Association battled unsuccessfully for reform in medical education during the

first decades of its existence (1847–67). By 1870, the hopeful reformers of the pre-Civil War days were generally pessimistic about improving medical education. The Civil War itself had cut down on the number of proprietary schools and students, but this was merely a marking time for post-war expansion. By 1880, the catalogues of medical schools generally specified a high school diploma or its equivalent for matriculation. The “equivalent” often turned out to be whatever the applicant had, if he didn’t have a high school diploma.

In 1800, there were four medical schools in the US; in 1825, 18; 26 new medical schools were started between 1810–40; 47 between 1840–76; 114 between 1873–90. About 400 new schools were founded between 1800–1900.

Conflicting forces were at work. The proprietary schools continued to flourish, but new attitudes developed. The 1862 Morrill Act stimulated the land grant university and, in so doing, strengthened and brought into being the public high school. Although compulsory education existed in only seven states by 1896, the general quality and number of students was gradually improving at the high school level. The Johns Hopkins Medical School required a degree at its opening in 1893, but the Council on Medical Education of the AMA recommended only a year of college for medical school admission as late as 1906. By the time Flexner made his survey of a 155 schools in 1910, 16 required two years of college and six more were scheduled to require two years by 1910. In the same year, 50 other medical colleges required only a high school education or equivalent.

Prior to the Civil War, there was little laboratory medicine and even thereafter, the laboratory sciences were taught by practicing physicians. Between 1800–30, the school year was generally 13 weeks and made up almost entirely of lectures. By 1890, 76 schools required six months of courses. By 1910, practically all schools required four years of graded instruction.¹

Postgraduate training after the MD degree began about 1820 in Maryland at the Baltimore City Almshouse. There were both students, acting as clinical clerks, and physicians with the MD degree working with attending physicians. The students paid a fee, worked up new patients and made rounds with the attending physicians. The word “intern” referred to medical students during the 19th Century and did not receive its present meaning of the first year after medical school until around 1914. Two resident training programs started in Baltimore in the 1820s (Baltimore City Almshouse and University of Maryland Infirmary).

In addition to these resident training programs, a tremendous number of American doctors visited Europe for training. One estimate is that 15,000 American doctors visited Germany and Austria between 1870-1914.

At the first AMA convention in 1847, a resolution recommending a single independent State Licensing Board in each state failed passage. There was little hope for reform in licensure until around 1875, when the chaos of a lack of any policy caused the writing of new laws concerning licensure and practice.

Hudson¹ states: "The new laws reflected a wholly new national attitude. No longer was the scene dominated by fear of class legislation, by the pervasive attitude of laissez-faire or Herbert Spencer's version of social Darwinism which made the patient responsible for his own folly when he chose his physician unwisely. The confused lawlessness of 1830-70 had by now convinced the populace and their lawmakers that some degree of State regulation was both proper and necessary." State Licensing Boards were a step in the direction of improving the quality of medical schools.

The early efforts of the AMA to improve medical education were doomed to defeat because the proprietors of the medical schools did not wish to improve or change the education system which was their livelihood. It was not until 1904 that the AMA formed a permanent Council on Medical Education staffed by outstanding men who inspected medical schools and rated them worthy or hopeless. Their reports were made public and resulted in the closure of 29 schools between 1906 and Flexner's report four years later.

The Flexner report documented many of the forces and activities which were already known so that his report came at a time when reform was already well underway and his efforts merely helped carry the stream faster.

The founding of the Johns Hopkins Medical School was based on German medical science and German education. The fact that it succeeded nearly two decades before the Flexner report shows that leading medical opinion was pointed in the direction of reform well before it was documented.

The major death-blow to private proprietary medical schools was the increasing requirement for laboratories, libraries and teaching space.

The Medical and Chirurgical Faculty from 1848-75

The major efforts of the Medical and Chirurgical Faculty in these years was to maintain itself as a viable organization, to maintain the Library and to educate practicing physicians. On all these counts, it failed. Between 1859-66, it held no meetings; the Library in 1856 was unable to purchase any books or to rebind those requiring it. A suggestion was made in that year to dispose of the Library to some other library within the city.

There were, however, evidences of the slow advance of medical science. In 1853, recent advances in auscultation of the lungs was reported by Dr. David Stewart. Dr. E. G. Edrington reported the ligation of both common carotids.

In this year there were 35 new members. The first

specialty society (the Pathological Society) was founded.

The Civil War interrupted the activities of the Faculty. It was not until 1870, under the leadership of Dr. J.R.W. Dunbar (he replaced Dr. Roberts, deceased, who had held office since the last formal meeting in 1859), that a new building on Courtland St. was purchased (1869). Thereafter, the Faculty met regularly up to the present.

Thus the years 1849-76 reveal little advance in medical education or in the activity of the Medical Society, but new methods were being discovered. Chemistry was coming into its own as an important basic science. The microscope, histological stains, histology, pathology, the stethoscope, anaesthesia and surgery were making gradual, if unspectacular, advances, but, perhaps, the most important advance was the gradual realization that medicine could be a scientific profession, that the laboratory and hospital were the workshops of the physician and that the focal point of advance was in improved medical education. □

CAS announces the **Xerox Diablo 3200 for effective medical billing management**

The Xerox Diablo 3200 is being used by single practitioners and small medical groups from coast to coast. CAS now offers this proven system to medical professionals in the Delaware, Maryland and District of Columbia areas.

Saves time and money

You're no stranger to the way advanced medical technology saves lives. Why not use advanced business computer technology to save time and money for your practice?

The Diablo 3200 Video Medical Management System bills third parties, accounts for patient receivables, pays your vendors and employees and prints your financial reports, *now*. Additional patient information storage, retrieval and reporting capabilities are available through the 3200's English language-like programming facilities.

Posting is easy and accurate

The big video display makes charge posting, patient/guarantor alphabetic look-up and complex revenue analyses easy and accurate. Thousands of patient records are stored on inexpensive diskettes; tens of thousands on disks. Extraordinary printers produce patient bills, superbills and financial reports quickly and accurately.

Improves cash flow

Insurers will like the 3200's optional machine readable type fonts. You will, too, because quicker claim handling improves cash flow. Additional video displays, expanded information storage, and communications facilities permit the 3200 to grow with your expanding requirements.

A proven system

What's the bottom line? You can lease the Diablo 3200 for as little as \$500 a month, and you don't need additional people to operate it. A purchase will result in an immediate investment tax credit.

CAS is adding the Diablo to complement its proven, state-of-the-art system which has been implemented in larger medical group practices throughout the country.

The Xerox Diablo 3200 is the modern solution for problems with billing, asset management and financial reporting.

The Reverend Leslie R. Miles, Jr., MD: The Churchman as Physician, the Physician as Churchman— What It's Like to be **BOTH**

By BLAINE TAYLOR

Contact Mr. Taylor, **Journal** Managing Editor, for reprint and other data c/o the **Journal**, 1211 Cathedral St., Balto., MD 21201.

Prologue: Doctor, Priest, Sports Enthusiast

The tall, slender, graying, bespectacled physician rose to give the invocation at the 298th Meeting of the Med-Chi House of Delegates in Osler Hall in the Faculty Building at 1211 Cathedral St. in downtown Baltimore on Sept. 29, 1979. The doctor—Chairman of Med-Chi's Committee on Medicine and Religion (now in his fourth term)—was 53-year-old Reverend Leslie Roy Miles, Jr., MD, who is both a physician **and** an ordained Episcopal Priest, since 1972 Vicar-in-Charge of St. Peter's Episcopal Church at Lonaconing, a small Western Maryland town of 2,000 people with an additional 4,000 in its outlying areas. Dr. Miles has practiced family medicine there for 24 years, serving for 10 years prior to his ordination as a lay reader, senior warden and chaliceist (assisting priests in giving communion before becoming a priest himself.)

A Past President (and current Treasurer) of the Valley Ministerial Association, the Reverend Dr. Miles organized and supervises the Valley Church Volleyball League's seven teams. As Team Physician for all sports at the local Valley High School, Dr. Miles annually examines boys for football, soccer, wrestling, basketball, baseball and track, and girls for basketball, volleyball and cheerleading—at no cost to either school or students. In 13 years, he claims he's never missed a football game—at home or away—and attends most other sporting events as well.

A member of the Board of Directors of the Lonaconing Little League in baseball, Dr. Miles also organized and was first President of the "Football for Valley Club," led a drive in 1964 that raised \$7,500 to purchase football equipment for the then-infant Valley High team, and, two years later, helped raise \$13,000 to install lights on the football field, for which he, in addition, personally secured donations of labor and material for the job as well as physically labored on it, too!

Another drive raised \$5,000 for school band uniforms, while still another established a school health department (which Dr. Miles supervises) for the treatment and

care of students. He is also physician to the three teams comprising the George's Creek Football League, plus being Treasurer of the Board of Directors of Boy Scouts of America Troop #26, and is its physician, too. In 1972, he was cited by the Lonaconing Recreation Commission for his "Outstanding work and contributions as a civic leader."

A long-time member of the town's Rotary Club, Dr. Miles has served as its President once and Secretary twice, and is a member, too, of both the local VFW and American Legion (during World War II, he served as a Medic with the US Third Army of the legendary Gen. George S. Patton, Jr. — whom he met and still considers "a great man"—and he saw combat in the Battle of the Bulge in Belgium, in Luxemburg and in the German Rhineland.)

Born in Huntington, WV in 1925, Dr. Miles obtained his BA degree at that state's University in 1949.

Medically, he received his MD in 1953 from the University of Maryland School of Medicine, and has been a member of the American Academy of Family Practice since 1958, receiving its Fellowship in 1972.

A member of the Allegany County Medical Society for 24 years (as well as of Med-Chi and the AMA), Dr. Miles was the Society's President in 1976, has twice served as its Secretary-Treasurer and has, for the past six years, been its Delegate to Med-Chi. This year, the Society elected him to the Med-Chi Council, while, in 1975, it recommended him for receipt of the prestigious A. H. Robbins Award for Community Service, which he won. (The honor is given once per state per year.)

DR. MILES SPEAKS at Med-Chi Annual Meeting on May 1, 1975 at Hunt Valley Inn, Cockeysville, MD, while Manning W. Alden, MD, listens at rear. (Photo by Jerry Goldberg, Guill Photo, Balto., MD.)

Dr. Miles is a member of the medical staffs of Sacred Heart and Memorial Hospitals (both in Cumberland) and Frostburg Community Hospital (where he has served two terms as Staff President); also, at Sacred Heart, Dr. Miles was the founder and first Chairman of the Hospital's Department of Family Practice, and is Medical Director of Lonaconing's 24-bed nursing home, too. In 1972, he was cited by the American Red Cross for "Outstanding cooperation with Red Cross blood programs."

Married to the former Donna Hutt, Dr. Miles has a son, Bruce, age 27, who is "herdsman" on a large North Carolina dairy farm; another, Donald, age 25, is head of the Respiratory Therapy Department at Haupshire Memorial Hospital in Romney, WV (his father, acting in his Ministerial role, married this son to a Registered Nurse) and a daughter, Diana, age 18, who graduated this year from Valley High School. The Miles have one grandchild, with another due in December, 1979.

All of his varied activities leave Dr. Miles very little time for hobbies, but he does enjoy reading Sherlock Holmes adventures, as well as historical books on the Second World War and the American Civil War (particularly those by the late author Bruce Catton), adding,

"I've very much enjoyed the **Journal's Health in History** series of articles. I think they're tremendous, just great!"

For 15 years, Dr. Miles has been a member of the American Academy of Sports Medicine, and it was with this aspect of his career that the interview began in the **Journal** office on June 21, 1979.

Sports Medicine

How long have you been involved with sports medicine, and what got you interested in it originally?

When I first went to Lonaconing, they didn't have anyone to examine the athletes, and just sent them to a doctor and told them they had to be examined. They asked me once if I would mind examining a soccer team, so I did. A few boys then came out for basketball, and I just sort of gravitated into it.

Do you have a lifelong interest in sports yourself?

I've always been an "athletic supporter"—but I haven't been much of an athlete myself. I've always been interested in sports, primarily football.

You look like you're in good physical shape yourself—trim, and not overweight...

I was; in 1976, I had a mild heart attack and, after that, I decided I'd better get in a little shape, because I was pretty flabby. I lost 25 pounds and weigh 160 now. I'm about 5' 10" in height. I **should** weigh between 150-155 pounds.

Cheerleader Ailments

In your examinations of various cheerleaders after their injuries, what kind of injuries did you find—ankles, feet, things like that?

Wrists, mainly, because they do cartwheels and pyramids and things of that nature. They get any kind of injury that an athlete gets.

Have you had any with broken arms or legs?

No. The worst I've ever had was a bad sprain of an ankle—ankle injuries probably more than anything else.

The Lure of Lonaconing

What brought you to Lonaconing?

I was hungry! I started my practice in Capon Bridge, WV, and it

was **really** a **rural** practice! When my family moved out—myself, my wife and two boys then—the population dropped to 99 in the community where we lived! A house call was 30-40 miles away, with home deliveries, etc. I was there about 18 months and netted about \$11,000-\$12,000. After Internship in 1953, **that** was a lot of money, as I made all of \$1,200 during the year I served my Internship, so I thought I was making a pretty fair living when I started to realize "This isn't it." There just weren't enough people in the area.

Initially, I heard about Lonaconing from a drug salesman who came by one day and told me that the people there were looking for a physician. He gave them my name and address, and the next day some people were down to see me! They said they'd pay my moving expenses, fix up some office space and give me an apartment rent-free until I felt I was able to pay. I decided that **anything** was better than what I had, and so came to Lonaconing at age 30. After a couple of months, I was able to pay the bills, and have done very well since.

Has the community grown a lot in the last 25 years?

No. There's very little transience. The town can only accommodate a small portion of the young people who grow up there because of the job situation, and the population has stayed basically the same. It's a suburban community in relation to Cumberland, MD. Many people work in local strip-mining. Geographically, it's very similar to the mountainous area of West Virginia that I left, although it's really suburban, not rural.

We have virtually every business represented in the town, but they're all small-scale.

Has your family enjoyed living there?

Yes. The young people have more than enough social activities to keep them busy! My boys could go a hundred yards from the house and camp out in a tent. They both did all the things rural people do.

Do you think you'll spend your retirement years there?

I probably will.

Prominence

Having almost been drafted, as

LESLIE R. MILES, JR., MD (Photo by Donna Miles.)

it were, into the community, you must be one of the area's most prominent citizens, right?

Well, it's like they say: Do you want to be a big frog in a little pond or a little frog in a big pond? This is what you amount to there. All these organizations—from the Rotary Club to civic improvement associations and so on—want me to be part of them. I don't mind it. I enjoy it. You **are** important to them, too. It doesn't make any difference if they're debating putting a park in or what—they want **my** opinion. The people think of you as a physician. You know everybody, and everybody knows you. On the street, it's "Hi, doc." It's a very friendly, congenial atmosphere. Now I'm treating the babies of people I delivered years ago, so you're very close to everyone. I practiced there for 23 years by myself and now I have an associate who is a boy I treated in grade school and high school, and treated his family all along and talked him into coming back after medical school because I needed the help. He's been with me a year and a half, and it's been a good feeling to have him with me.

Local Politics

Have you ever been approached by the townspeople to run for office?

Yes. I ran for Mayor once, in the mid-Sixties, but lost. There were two other candidates, and I came in third in a field of three. People would come into the office and say, "I think you'd make a good Mayor, but we'd rather have a doctor, and we think that's going to take too much of your time." That was the end of my political career!

Did you run as a Democrat or Republican?

They're **all** Republicans there! They have a standing joke that they're still looking for the two people who voted for Franklin Roosevelt! Fortunately, I happened to **be** a born and bred Republican, but they wouldn't have thrown me out if I was a Democrat, I don't think.

Some people **had** asked me to run for Mayor. What we tried to do was set up a slate with a Mayor and four Council candidates to run who were five businessmen, figuring

that we would have an interest in the community itself that the commuters who worked elsewhere wouldn't. We got four businessmen and myself, but, unfortunately, only one of the businessmen out of the five of us got elected. We tried to run as a party, but you just can't do that in an area like that—you run as an individual, as I found out. I didn't get elected mostly because I was a physician. I got 85 votes, while the winning candidate got a couple of hundred, out of a voting turnout of around 350 people.

Will you run again?

I don't rule it out.

So, one day I might be able to refer to you as "the Ross Pierpont of Lonaconing?"

(Laughingly) Right, right! Seriously, though, I might run again later on, as I get a little older. Now that I have an associate and some more free time, it's much more possible, but the two professions I already have—the clergy and medicine—keep me pretty busy.

The Clergyman

What decided you to become a Minister?

I've always been active in the Episcopal Church. Mine is a "mission" church as they call it. It's **not** self-supporting—and hasn't **ever** been. It's the oldest church in the community despite this, with 85 communicants at present who're actual members; 25 are in Sunday school who're **not** church members, plus about 10 others who come intermittently who're not members, either. It's very expensive to get a fulltime priest, and our church budget runs about \$12-\$14,000, while it takes about \$20,000 to get a fulltime priest—for salary, car allowance, utilities, etc. I'm salaried to the tune of \$170 a month, however.

So, again, you're doing this to fulfill a community need, as earlier you did as a physician?

Yes.

How did it all come about?

It took me a little over a year to become ordained. I studied with two priests once a month on Wednesday afternoons. They'd give me reading assignments in theology. The social, psychiatric and psychological parts of the seminary I'd already covered fairly-well in

pre-med and med school. At the end of this period, they said I was ready to be ordained. There's a special canon in the Episcopal Church that allows for ordination under these circumstances in an area of need.

Are you the only physician/priest in Maryland?

No. There're two other Episcopalians I'm aware of: George Merrill and Ira Fetterhof, a psychiatrist in Hagerstown, who was a priest before he was a physician. I am, so far as I know, the only person **practicing** both professions at once, however.

Roles in Conflict?

Being a scientist as a doctor, do you ever run into any conflicts between religious faith and scientific reasoning?

No, I don't have any conflicts.

Let's say you're treating a patient who dies while you're there. Do you administer the last rites?

Yes. I've jokingly said that my next step is to take up being a mortician!

That's really cradle-to-grave service! Any other problems connected with your life's duality?

The two complement each other really. They go together very, very nicely. I have patients come into the office whom I've seen for 20 years and they'll say, "I can tell

THE REVEREND LESLIE R. MILES, JR.
(Photo by Donna Miles.)

you this now that I know you're a Minister." I'll ask, "Why couldn't you tell me this before?" "Well," they'll respond, "I just feel better talking to you about this now." I do more marriage counselling in the office than in a church-sense. I get a lot more family problems, and it's easier to handle them working as both. Sure, you use tranquilizers for the nervous housewife, but I have the opportunity to also counsel her in a religious sense, which helps her get off the tranquilizers sooner and helps her solve her family problems sooner that I couldn't do before.

Do you perform abortions?

No. I can't do them.

If you were a surgeon and somebody came into your office for an abortion, what would you do? Is the Episcopal Church against it?

The Church is violently against it. I believe this: abortions are wrong morally and I don't think the State has any right to legalize or not legalize abortions. I don't think it's any of the State's business, but the Church's instead. It's up to the individual to decide.

Is this how you would counsel someone?

Yes. One of my parishioners is now married, but at the time, he and his wife were both in school when she became pregnant **before** they were married. They were thinking about an abortion. I told them it was their decision, that abortions **were** legal and that—if they did it—it should be done properly. I didn't advise them one way or the other. A week later, they called and said they'd decided to **have** the baby. I think the decision came from their religious training. I was **hoping** that enough had gotten through to them in Sunday school! They have a great little two-year-old now, with another on the way soon!

What about conflicting roles in giving birth control information as a physician to a 15 year-old unmarried girl? Do you feel, as a priest, you should tell her, "Hey! Don't do this?" As a physician, your saying "Here's how to do it," right?

If they're not members of my parish, I give them good medical advice only and have no qualms

about it. I'll often mention that "You ought to give this second thoughts. Why do you want the pill?" I try to get them at least to think about it—but the effort is usually a total failure. One member of my parish is a teenage girl on the pill. I've counselled her **both** ways—and she's taking the pill. In a sense, it's a failure on my part as her priest, but, still, as a physician, I think I have to give her what she wants. I'd rather give it to her medically than have her do something wrong. I've had Penecostal, born-again patients who accept me as a doctor also—but not as a priest.

From your duality, do you think you've gained a greater knowledge of each of the two roles?

I believe so. I think it's helped me, personally. I had a lot of qualms about entering the priesthood. During the times we'd be without a priest, when I was serving as a lay reader and chaliceist, I could conduct morning prayer, but couldn't celebrate the Mass. Before I was ordained, we were a year without a priest, when my bishop asked me to do it. My wife felt it was a big joke, so I ignored it. The bishop called me and came up to see me. I thought of all the ways this church could carry on without **me** being ordained and presented all these ways to the two bishops who came to see me. They pointed out that none of these could be worked out, and that the only other solution would be to close the church, so I eventually gave in. I have no regrets. It's been the greatest thing that ever happened to me! I enjoy it, and it's almost a hobby in the sense that there's just no way you can explain celebrating the Mass.

Is it more of a "high" than delivering a baby?

Oh, yes! I get a **tremendous** feeling out of it.

Have you ever heard a confession that complicated your role as a doctor to heal, as opposed to your priestly obligations to silence and confidentiality?

No, although I've come close. Initially, I counsel them as a priest and end up talking as a doctor. I'll see them in the church, with my collar on, then suggest they come to the office later! The two roles just work beautifully hand-in-hand.

Have you ever had to run out of church, jump in your car and go to the hospital?

Believe it or not, in seven years it's happened **twice**! One was a patient who was dying. On both occasions, another priest was there celebrating with me.

Which of the two roles has influenced the other the most? Has your being a doctor made you a better priest or the other way around?

The priesthood has made me a better doctor.

Has it given you more of a reverence for life?

Right. As a physician, in most cases, you're very scientific. Most physicians, I think, are religious, but you still look at disease and medicine as pathological things. You get a much better approach to life and death as a priest than you **ever** do as a physician. There's a sort of medical finality about death: "OK, it's all over. He's dead. I did everything I could do, everything that modern medical science prescribes, but we all know we're going to go." You turn your back and walk off to the next case. As a priest, you **don't** do this, because, in the clergy, you know that life **doesn't end** here, but that death is truly the **beginning**. This person who's died has, supposedly, gone to a **better** life. The body is a dead item, but there's a spiritual life, so you don't feel as lost as you do strictly as a physician. There's more for the priest, such as counselling of the bereaved family. It's given me a whole new philosophy of how to handle these people. I think it works out better. I'll retire as a physician before I do as a priest.

Thank you, Dr. Miles.

Acknowledgments

The author thanks Mrs. Mildred Chronister for secretarial services. This story marks the last such project commissioned by the late **Journal** Editor C. Thomas Flotte, MD, who died Dec. 15, 1976. □

**You chose
a profession
with many
demands.**

**We chose
a professional
to help you
meet them.**

You might know Jack Isaacson. Maybe you've had occasion to use his financial expertise. He's helped a lot of physicians with sound advice and professional loans.

Jack's with American Bank now. Jack's knowledge of the medical profession, his experience with solving the financial problems of a practice, make him a valuable asset in our business. With him around, American Bank can help you meet the costs of starting a practice, expanding, remodeling or buying new equipment. And he can arrange terms to suit your individual situation and the growth of your practice.

**Jack
Isaacson
the doctor's
banker**

If you're just starting out, going solo or thinking about some improvements, may we prescribe Jack Isaacson, the doctor's banker. You can reach him at (301) 565-7011.

Springwood AT LEESBURG

A private psychiatric hospital in the Virginia countryside, 35 miles west of Washington, D.C.

- Individualized and confidential care in a comfortable therapeutic environment
- Suitable for the most demanding patients including professionals, corporate executives, government officials, and their respective family members
- A broad range of therapeutic modalities, including a specialized program for the treatment of alcohol- and drug-related problems

Accredited by the Joint Commission on Accreditation of Hospitals (JCAH)

Upper Gastrointestinal Bleeding

by John Chapman, MD

Dr. Chapman is affiliated with the University of Maryland School of Medicine, where he can be contacted for reprint and other data.

Presentation of a Case

The patient presented to the University of Maryland Hospital emergency room on Feb. 11, 1979 with a chief complaint of vomiting blood. This 47-year-old, white, male, alcoholic had previously been admitted to the Loch Raven Blvd. Veteran's Administration Hospital in Baltimore for myocardial infarction with electrocardiographic evidence of anteroseptal and inferolateral infarction.

Upon presentation to the emergency room, grossly melanotic stools were noted. The patient recalled a three-month history of hematemesis with concomitant change in the pattern of his bowel movements to "little bits" four-five times per day. He had a history of heavy alcohol use for 10 years and continued to drink two fifths of alcohol per day up to the day of admission in spite of severe vomiting.

During the three weeks preceeding admission, he noted increasing weakness with recurrent sternal pain which was described as crushing and radiating to the back, associated with shortness of breath and diaphoresis.

He gave a history of two pillow orthopnea and paroxysmal nocturnal dyspnea but denied ankle edema, increasing abdominal girth, jaundice, hepatitis or peptic ulcer disease. He has a 60-pack-a-year smoking history. His last admission to a hospital was three months prior to this admission. He received a one-year course of therapy with isonicotinic acid hxdrazide for conversion to a positive PPD skin test. His family history and past history were otherwise unremarkable. Upon admission, the temperature was 101°F, pulse 110, respirations 30 and blood pressure 140/90 supine which dropped to 120/80 with sitting. He appeared moderately obese and in no apparent distress, but was uncooperative and demanded medications for his nerves. His skin demonstrated spider angiomas. His sclera were non-icteric. Examination of the chest, heart and abdomen were normal. Rectal exam revealed guaiac positive stools.

Abnormal laboratory examinations upon admission were Prothrombin Time 13 sec./control 12 sec., partial thromboplastin time 27 sec., Hematocrit 31%, hemoglobin 10.5 gm/deciliter, and a BUN of 16 mg/deciliter. His hematocrit was 45% three months ago. His chest X-ray was normal without cardiomegaly. His EKG was without acute change.

Upon admission, a nasogastric tube was inserted and nasogastric lavage cleared the blood immediately. Six hours post-admission, the patient vomited bright red blood and a repeat hematocrit was 26%. Transfusion with packed red blood cells was begun. Upper endoscopy of the esophagus, stomach and duodenum was performed. A small bleeding point was seen in the distal esophagus and believed by the endoscopist to be as a Mallory-Weiss tear. The stomach and duodenum were

normal.

After 36 hours and 12 units of transfused blood, the patient's hematocrit stabilized at 30%. His hospital course was complicated by one episode of severe angina requiring transfer to the Coronary Care Unit. The patient was discharged on the 14th hospital day.

Discussion

GI bleeding is associated with a mortality of approximately 10%.¹ Management is now augmented by fiberoptic endoscopy, selective angiography, and barium contrast—air contrast radiography.

Pathophysiology and Clinical Manifestations

An understanding of the patient's response to the blood-loss, the rate and extent of the blood-loss and the capacity of the patient to further respond to volume depletion are necessary to make initial early treatment decisions. Is it an acute or chronic blood loss?

In an acute blood loss, the blood pressure may drop, the pulse may rise, a resting tachycardia may be present; the skin may show pallor and there may be a decrease in the urine output. In chronic blood loss, the changes are more subtle unless very severe.

One must be concerned with three organs that can be readily and permanently damaged, the brain, the eye and the heart, looking for signs and symptoms of cerebral ischemia, retinal artery spasm (which can occasionally lead to blindness) and cardiac ischemia.

Hematemesis suggests bleeding from above the ligament of Trietz, while melena suggests that the bleeding is above the ileocecal valve.

A blood pressure of 100 or less, or a pulse greater than 100 suggests greater than 20% blood loss. A 20 mm. fall in blood pressure upon sitting confirms a loss of this magnitude. A nasogastric aspiration must be made in all patients to assess the rapidity of blood-loss and its level and is useful as a part of the initial evaluation.

A rectal exam with a guaiac or Hemoccult test should be done and a blood sample should be obtained as early as possible for serum electrolyte values, BUN and hematocrit with sequential BUN and HCT determinations to check for cessation of blood-loss.

Early Therapy

The care of the GI bleeder should rest in the hands of a team composed of the primary physician, the gastroenterologist, the surgeon and, often, the radiologist. Resuscitation is the initial event, with intravenous saline and blood products. As this task is often carried out by others than the primary physician, a single, centralized flow chart is indicated upon which hourly observations of the patient's mental status, pulse (supine and upright), blood pressure, central venous pressure in the elderly or unstable, gastric aspirate, stool, urine output, Hematocrit, electrolytes and therapy (blood products, intravenous fluids, and drugs) are recorded. After resuscitation, then, one's efforts are turned to diagnosis.

Diagnostic Methods

There are six major diagnostic methods.

First: the history. Pain suggests a GI lesion penetrating the muscle layer while gastritis Mallory-Weiss and bleeding varices are usually painless. Vomiting preceding the bleeding suggests Mallory-Weiss. Previous episodes of bleeding can suggest recurrence, weight-loss suggests malignant disease. Drug and alcohol use is important to assess their effect on the patient's status. A history of cancer or aspirin use carries with it an increased risk of bleeding from gastritis.

Second: the physical exam. In the exam of the skin, one looks for the stigmata of alcoholism, Osler-Weber-Rendu or skin manifestations of Inflammatory Bowel disease. In examination of the lungs, one wants to rule out aspiration if possible. A thorough neurological exam is necessary to look for intracranial disease which might have resulted in a Cushing's ulcer.

Third: is the laboratory, to determine the impact on the patient. Serum-blood chemistries should include Hematocrit, electrolytes, coagulation factors and BUN. An EKG, arterial blood gases and a routine chest check are also indicated in patients 30 or older.

The final three diagnostic tools are endoscopy, selective angiography and barium contrast radiography.

Endoscopy

The development of the fiberoptic endoscope in 1958 significantly enhanced the role of endoscopy. In the absence of severe pyloroantral deformity, the duodenal bulb and the proximal duodenum can be examined in 95% of patients.² There are relatively-few contraindications to fiberoptic endoscopy, and the procedure can be accomplished on an emergency basis with the patient in the hospital bed. The overall mortality rate of endoscopy is 0.019%.³ Peptic ulceration, cancer, varices, esophagitis, gastritis and the Mallory-Weiss syndrome can be well-visualized with endoscopy and biopsies of masses can be obtained.

According to Iglesias, et al, prompt endoscopic diagnosis of upper GI hemorrhage has value of specific diagnosis and management.⁴ In his study done at Cook County Hospital with 789 patients admitted as Upper GI bleeders, 45% had more than one lesion. Erosive hemorrhagic gastritis was the most common lesion, followed by gastric ulcer, esophagitis and duodenal ulcer. The importance of early endoscopy was emphasized by a decrease in detection rate of lesions with an increase in time interval between the onset of bleeding and the time of endoscopy. Iglesias argued that finding the bleeding source is important to direct the management and treatment. For example, a precise diagnosis of gastric ulcer which has continued to bleed past 12-24 hours of medical management should be treated surgically, while erosive gastritis is treated medically, even after prolonged bleeding.

Eastwood in 1977 reviewed the results of four prospective controlled trials comparing early endoscopic approach to less aggressive methods.⁵ That endoscopy is the more accurate diagnostic tool is not questioned; however, the anticipated benefits of early diagnosis, such as more effective treatment, reduced transfusion

requirement, more rational use of surgery, decreased length of hospitalization and improved survival, have not resulted. He states that the necessity for a definite diagnosis has not been proven, that endoscopy must assume that the potential benefit outweighs the risk and that endoscopy is expensive. He concluded by suggesting that restraint be exercised until clinical trials can be evaluated.

Oddson, citing E. D. Palmer that it **has** been established that the mortality rate resulting from upper gastrointestinal hemorrhage increased if patients are treated medically without diagnosis of the specific site of bleeding.⁶

Obviously, the individual physician must use his or her own judgment as to how and when endoscopy is indicated in the diagnosis and management of the UGI bleeder.

Selective Angiography

Shenow suggests "If you don't get along with your surgeon, make friends with your radiologist."⁷

Angiography is generally reserved for the patient with a negative or non-diagnostic endoscopic evaluation. Massive bleeding prevents the endoscopist from getting a good look. Here, the contrast media may extravasate into the alimentary canal and delineate the source of bleeding. To be effective it must be done while bleeding of at least 1/2 ml./min. occurs and **before Barium** is given. Some bleeding can be demonstrated by angiography where it is often missed in endoscopy, particularly in the colon. Patients who are poor surgical risks because of pulmonary or cardiovascular disease, are candidates for arterial embolization.

Angiography is the method of choice for diagnosis of A-V malformation of the small bowel and can also demonstrate tumor vascular blush and aneurysm. A new and increasing problem in the elderly is bleeding angiodysplasia of the right colon.

Barium Contrast Radiography

This subject is very appropriately reviewed by Oddson et al.⁶

For at least 50 years, the barium exam was the primary diagnostic procedure. Now it is secondary to endoscopy and angiography. Limitations are that mucosal detail is difficult to evaluate in the presence of blood and clots in the stomach. Superficial lesions are virtually impossible to identify. Even though the lesion may be identified, it may not be the bleeding site. Finally, the barium in the GI tract interferes with any subsequent angiographical study or treatment.

Barium examination of the upper GI bleeder is useful if endoscopy is contraindicated or unsuccessful, and the active bleeding has been terminated. It is also useful if it is the only method available.

Summary

Upper GI bleeding is one of the more common problems encountered by physicians taking care of adult patients. This problem requires prompt evaluation of the extent and site of the bleeding, with an appropriate understanding of the pathophysiology, the differential diagnosis, the diagnostic tools available, the

specific therapy for the specific underlying cause and, finally, the ability to effectively make decisions as to the course of management of the individual patient.

Home-Style Nursing by Mary Kate House

**The MPP Nurse.
A Special Person.**

All the nurses who work for Medical Personnel Pool are special. What makes them so special? Being a skilled professional and being associated with other professionals with extremely high standards of excellence. Knowing their skills will be fully utilized by MPP staff's careful assignment matching. And also, very importantly, by being able to devote as much time to their nursing career as they wish without sacrificing their personal lives.

MPP's concept of flexible scheduling allows our employees to work as many hours as they wish or as little on the days and weeks convenient to their individual schedule. Everyone benefits as valuable nursing skills which would otherwise be lost are being provided for patient care.

A flexible schedule is only one of the many benefits that await you when you work for Medical Personnel Pool, one of the most highly respected nursing services in its field. Choice of assignments, extensive insurance coverage including professional and general liability and worker's compensation insurances, in-service education, competitive salary, and a reputation for high standards are just a few of the others.

To learn more about the many opportunities awaiting you at Medical Personnel Pool, stop by your local MPP office.

Aspirin: Its Multiplicity of Side-Effects

By JOHN C. KRANTZ, JR., PhD

Dr. Krantz is Professor Emeritus of the Department of Pharmacology at the University of Maryland School of Medicine. For reprint and other data contact him at Gibson Island, MD 21056.

There is **no** drug available that cannot be improved upon. The action of most drugs is accompanied by side-effects. These may be intolerable and render the therapy unbearable or may be of such minor character that the patient is unaware of their occurrence. Indeed, certain drugs elicit side-effects that can be as useful in therapy as their principal action. A classical example is that of the antihistamines that have been found useful in the treatment of insomnia. The principal use of aspirin depends upon its value as an analgesic and anti-inflammatory agent. In this use, minor gastric intolerance is sometimes encountered that is obviated by well-buffering the drug and the ingestion of much water with the tablet.

When the dosage of aspirin is increased, other interesting side-effects appear, such as the reduction of blood-cholesterol levels¹ and the lowering of blood-sugar levels.² Each of these side-effects may be beneficial to selective groups of patients.

Another side-effect of aspirin is production of micro-bleeding of the gastric mucosa. The patient is unaware of this effect and it can be avoided by well-buffering the aspirin and taking the dose with much water.

Another most striking side-effect of aspirin is upon blood platelets. The drug diminishes the aggregation of platelets, which is a step in the initiation of the clotting process. Weiss³ in 1967 observed that the ingestion of small doses of aspirin caused a minor increase in the bleeding time of normal subjects. This was due to the effect of aspirin upon the aggregation of platelets. This observation suggested the possibility of the use of this side-effect of aspirin in the prevention of diseases owing to the clotting of the blood in the brain, heart or other organs. Other drugs, such as phenylbutazone and indomethacin, also evoke the inhibiting action on platelet aggregation, but aspirin offers the optimal use for mass medication, presenting the greatest ratio of benefit/risk.

It is of interest that this is not the action of salicylic acid as sodium salicylate does not produce the effect. It appears that the acetyl group in aspirin is the functioning factor. It acetylates the platelet and prevents the aggregation process. Indeed, the acetylation endures throughout the life of the platelet, four-seven days.

Our knowledge of the mechanism of the action of aspirin in the prevention of platelet aggregation is in a state of flux. It is generally agreed that it is concerned with its effect upon the prostaglandins which enjoy a multiplicity of roles in many tissue functions. PGX, one of the most recently isolated prostaglandins, plays a key role in the prevention of platelet aggregation. It is postulated that platelets impinging upon the inner lining of blood vessels release prostaglandin endoperoxides PGE₂. These cause platelet aggregation. Simultaneously, the cell wall releases an enzyme which converts

the endoperoxides to PGX, thus preventing platelet clumping.

Aspirin, indomethacin and other anti-inflammatory drugs appear to block the conversion of arachidonic acid to PGE₂, that causes platelet aggregation. This allows PGX to function uninhibited in its capacity to prevent platelet aggregation.⁴ It is clear that our understanding of this intricate mechanism is still in its infancy and much work will be required before our knowledge of it is complete.

Of special interest is the ability of the aggregation to be initiated by alternative pathways so that hemostasis is not impaired in the normal person.

Reports are available from many clinical centers indicating the value of aspirin in the prevention of vascular accidents. For example, in 1974, British investigators⁵ reported that 600 heart attack patients who had taken one aspirin daily had 25% fewer heart attacks than those who had taken a placebo. The evidence at hand bespeaks the benefit/risk ratio for mass medication is high. It would appear that individuals who have suffered a heart attack or "little stroke" might reduce their chance of a second episode by the ingestion of aspirin daily.

Whether or not it would be prudent for all persons in middle-life and after to daily ingest aspirin to guard against a vascular accident is problematic at present. One must wait until many more results are available from the present ongoing studies.

If Felix Hoffman, who introduced aspirin into medicine at the turn of the Century, were alive and viewed the expanding spectrum of the action of the drug, he would be greatly gratified. The author is reminded of the words of Emerson, writing of the hand that rounded St. Peter's dome, "The conscious stone to beauty grew; He builded better than he knew."

Upper GI Perforation by Metallic Wire Presenting as Acute Cholecystitis

By ASHWIN I. MEHTA, MD, FACS and PAUL G. HEROLD, MD

Both authors are affiliated with the Department of Surgery at Church Hospital Corporation, Baltimore, MD 21231. For reprint and other data, contact Dr. Mehta at 10 W. Madison St. Balto., MD 21201.

Abstract

A patient with wiry metallic foreign body perforating from the pylorus into the liver bed is presented. He came with the picture of cholecystitis. The patient was unaware of swallowing the wire. The situation was confirmed by exploration and removal of wire perforating from the pylorus going into the liver bed.

Case Report

This 60-year-old white male, KT, was admitted to Church Hospital on Dec. 26, 1977 with pain in the epigastrium and right upper quadrant of three weeks duration. It was associated with some nausea, but no vomiting. He had some tenderness in the right upper quadrant. No rebound tenderness. Bowel sounds were normal. The temperature was 37°C (99°F) pulse 82/minute, regular, blood pressure 138/78 mm. of mercury. Hemoglobin was 11.6 gms./dl. WBC was 8,000/c.m.m. The differential showed a shift to the left. Serum amylase was 58 units per dl. BUN, blood sugar and electrolytes were within normal limits. Chest X-ray was unremarkable. Gallbladder series was normal. Upper GI series was normal except for a wiry metallic foreign

body in the right upper quadrant. Multiple lateral and oblique views showed the wire to be anterior to the pylorus. (Figures 1 and 2) The patient on close questioning denied swallowing any such foreign body. He was prepared by giving one day pre-op antibiotics: Cephalothin 2 grams every six hours IV and Gentamycin 80 mg. every eight hours intramuscularly.

At operation, there was marked edema in the subcutaneous, extrafascial and preperitoneal tissues. After entering the abdomen, the omentum was found to be adherent to the liver in the form of a mass. It was freed-up, which revealed an abscess cavity with white pus. Gram stain revealed occasional polymorphonuclear leukocyte, rare red blood cells and debris, but no bacteria. Culture showed micrococci species—probably skin contaminant. The pylorus was freed-up from the liver. A metallic wiry foreign body was seen tented between the pylorus and the liver going from the pylorus into the liver bed. It was taken out. He did well post-operatively and was discharged on Jan. 4, 1978. Pathology Report: Metallic wire-like structure from omentum gross diagnosis only.

Comment

Accidental swallowing of metallic foreign body such

FIGURE 1 GI Series Frontal Projection showing wire in relation to stomach and duodenum.

FIGURE 2 GI series Lateral View showing wire in relation to stomach and duodenum.

as a pin, safety pin, knitting needle or sewing needle is a common event and usually the patient is aware of such an accident. One of us (Dr. Herold) had a similar case some 15 years ago when a lady presented with a similar

picture of cholecystitis. She was explored and was found to have a sewing needle with thread perforating from the pylorus going into the gallbladder. It was taken out and the gallbladder area was drained. She did well. □

Experience of One Year of Cancer Screening

By JOSEPH M. MILLER, MD and CAROLYN SPEIGHT, LPN

Both authors are affiliated with Provident Hospital, Inc., of Baltimore, MD 21215, where they can be contacted for reprint and other data. This work was fundamentally supported by a grant from the Morris Goldseker Foundation of Maryland, Inc.

The initial thrust of the program was to identify women in an at-risk population who might exhibit cervical and vaginal cytologic changes which might foretell a premalignant or a malignant state. A rising incidence of cancer in the black female was an immediate cause of concern.

Although this project was initiated to supply a special need, its incorporation into the general basic services supplied by an outpatient department is strongly recommended. Usually, these divisions include emergency care, walk-in clinics, general clinics, specialty clinics and home-care programs. The practice of preventive medicine, which seeks to maintain the normal healthy state or to discover early disease to prevent serious complications, is a growing facet of any health maintenance organization.

Medical screening of such nature under proper environmental conditions is appropriate on-going care necessary for the well and the sick. These programs should not be expensive. Laboratory studies should be minimal and inexpensive. The plan should be well-constructed and it should include education, informed consent, proper environment, good outpatient services to which patients may not only be referred for treatment, but **from which** patients may be referred, and good feedback relationships to patient and doctor to obtain a maximal therapeutic result.

The prime objective of the screening program is the indoctrination of the screenee without a regular source of medical supervision with the concept of having an annual examination and to encourage the use of auxiliary health services in a preventive care program. About 60% of cancer which affects the general population will be in the skin, lips, breast, cervix and rectum.

These areas are easy to examine and the entire examination can be done with the usual office equipment. The reward lies in the discovery of an unsuspected early lesion, which usually is readily curable. Objection to running screening programs is chiefly mounted in expense, and the assertion that other functioning clinics can do the same work with little increase in expense.

For those physicians who might wish to conduct such a program, the cost, *modus operandi*, results and suggestions emanating from the study are reported. The general target population was the group living in the perihospital geographical environment. The total population (1970) in 39 census tracts was 211,026, of whom about 204,734 (97%) were black. Although all applicants were examined, the ones particularly sought were those in the high-risk group, which include women who;

- 1—Had never had an examination of this type before.
- 2—Began sexual activity at an early age.
- 3—Were past the child-bearing age.
- 4—Were in a low economic class.
- 5—Were medically indigent.

Cost is a problem faced by any hospital administrator contemplating a new program. A screening plan of the type to be described can be effected for about \$15,000 per year to do 1,000 examinations. This sum includes the wages of a Licensed Practical Nurse to do the cervical smears and to care for the involved clerical work; \$4.84 to have each slide examined and \$1,000 for gowns, specula, slides, applicators, fixative and dipsticks for urinalysis. The cost of each examination is about \$15. The sum is large, but when the expected cost of hospitalization and therapy for one advanced lesion is contemplated, the price of the examination pales in comparison.

Most of the cervical smear slides were interpreted by cytologists working in the Baltimore City Health Department using guidelines established by the National Cancer Institute. The rest were examined in the Pathology Department of this Hospital.

After registration, the candidates were asked if they had had abnormal bleeding of any type, had noted unexplained lumps or had unhealed sores. The physical examination directed attention to the blood pressure, skin, mouth, neck, thyroid, breast, genital tract (pelvic examination) and rectum (rectal examination). A urinalysis for glucose and protein was also done. The cervix was inspected through a vaginal speculum for color, discharge and ulceration. A cervical and vaginal smear was then made in the following manner.

- 1—A cotton-tipped applicator moistened with a solution of physiologic saline was inserted and twisted in the cervical canal, and the cervical mucus was transferred to the slide.
- 2—The curved end of a wooden cervical spatula was abutted in the cervical os and turned to obtain epithelium. If the os was stenotic or obliterated from age or previous surgical procedure, the applicator could not be inserted. An appropriate notation was then made on the laboratory request slip.
- 3—The spatula was then immersed in the lateral vaginal pool and the combined specimen was placed on the slide.
- 4—The slide was sprayed with fixative.

Screenees were also given printed material dealing with self-examination of the breast, which was supplied by the American Cancer Society. The importance of looking for the early signs of cancer was stressed during the examination period.

The free program was advertised by notices on television and radio, and in the newspaper. A distinct effort was made to contact community leaders who could spread the word in their own sphere of influence. Advertising placards were placed in strategic areas in the Hospital, and all screenees were given a card detailing the service to pass to a friend. Perhaps the greatest source of referral was by word-of-mouth from a screenee to a prospective subject.

A compliance—appearance rate of 74% was obtained for the Fiscal Year of June, 1977—May, 1978. Appointments were made by the screenee on a time basis within two three-hour clinic periods. In all possible instances, the individual was advised by telephone on the preceding day of the approaching appointment. Still because of weather, forgetfulness or continued inattention to health matters, one of every four individuals did not appear for examination.

Results

In the period of survey, 972 women were seen. Racial composition was black (88.8%); white (10.5%) and other (.7%). These figures approximately parallel the composition of the population about the Hospital.

Abnormal slide readings were reported in 47 women (4.8%). Of these 47 interpretations, 17 (1.7%) were suspicious, 2 (.2%) were positive and 28 (2.9%) were inconclusive. When the various suggested diagnoses were more completely investigated, only two positive results remained.

Trichomonas vaginalis was found on the cervical smear in 206 instances (21.2%). In two large reported series, De Carvieri¹ found an 18.2% (315/1,732) incidence and Naguib² unearthed one of 14.5% (623/4,290).

Bard³ states that 30-40% of abnormal smears are associated with the presence of *Trichomonas vaginalis*. In this study, in only 10 (1%) of the individuals was the morphology of the slide disturbed enough by the inflammatory exudate to make interpretation difficult. Of the 47 slides classed as abnormal, 9 (19.1%) contained *Trichomonas vaginalis*.

The incidence of estrogen-like activity in the vaginal smear is of more than passing interest. Considerable variation is seen in the age of the menopause, but in the majority of instances, the menses cease between the ages of 45-50. Of the 972 women in the study, 441 (45.3%) were over the age 45. In this large subset, 63 (6.4%) showed estrogen-like activity. When the group was further narrowed, 51 (5.2%) were found to be five years past the menopause and still showed activity. Five women in this particular group were also infected with *Trichomonas vaginalis*. Only six women over 45 carried the protozoan and this 6% contrasts rather sharply with the overall incidence of 21.2%. The great difference may be related to a decreased sexual exposure after 45, or the beneficent effect of estrogen on a certain group of older women. Bard emphasizes the observation that a falsely high level of estrogen activity may be associated with *Trichomonas* infection which makes the estimation of estrogenic activity of doubtful value when the protozoan is present.

After the administration of estrogens for therapeutic purposes is eliminated, difficulty may be encountered

in explaining the presence of estrogen-like activity. Reasons for this observation include granulosa and theca cell tumors of the ovary, the administration of digitalis, related cardiac glycosides and cortisone and *Trichomonas vaginalis* infection. A certain amount of estrogen must also be made by atrophic ovaries after the menopause, and some estrogen is always manufactured by the adrenals. Although continued activity in repeated smears in the post-menopausal woman must arouse suspicion, a ready answer for the observation may not always be found.

Unsatisfactory smear results can be ascribed to:

- 1—Poor technique in making the smear.
- 2—Vaginitis of any type producing an inflammatory exudate hindering cytologic analysis.
- 3—Smears made just at the onset or termination of menstruation which were too bloody to interpret.
- 4—Too scanty or too thick a smear.
- 5—Vaginal douching within 12 hours of the examination.
- 6—Inability to enter a rigid cervix with the applicator.
- 7—Lack of columnar cells or too scanty an endocervical component. Columnar cells serve as a marker for the cytologist and indicate, if present, sampling of cells above the squamo-columnar junction.

Disposition of patients with an unsatisfactory reading due to a lack of columnar cells followed a directed course.

1—If the smear was from a woman at any age through five years after the menopause, the subject was recalled in eight weeks, and another slide was prepared. A second slide, still lacking columnar cells, would permit classification as "negative."

2—A slide without columnar cells in a patient who was five years past the menopause was classified "negative." The exception to this category was the patient who also showed estrogenic activity, and then, the smear was considered to be unsatisfactory. A second similar unsatisfactory test was a reason for colposcopy.

All patients were notified by mail of the results of the examination, and those with positive, suspicious, inconclusive or unsatisfactory results were requested to return for further evaluation. A diagnosis was given to everyone in the program.

The by-products of the survey are numerous. A large number of individuals with hypertension, which is rampant in the black population, have been uncovered and referred for treatment. A small number of people with diabetes mellitus have also been unearthed. A carcinoma of the breast was discovered and sent for therapy; 78 men of all ages have also sought screening. One individual was found to have a carcinoma of the prostate and one man had a basal cell carcinoma of the face.

In all, five carcinomas have been found in 1,050 patients. If the program had not been in existence, treatment in all of these individuals would have been delayed.

Summary

A cancer screening clinic built initially around the discovery of cervical dysplasia and cancer has served well as an excellent general screening clinic. The indoctrination of the screenee with the concept that an annual examination is good prophylactic medicine is the hope for the program. A number of other diseases unrelated to cancer have been uncovered by the investigation.

Quinamm™

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATIONS: For the prevention and treatment of nocturnal recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis, and static foot deformities.

CONTRAINDICATIONS: Because of the quinine content, Quinamm is contraindicated in women of childbearing potential, in pregnancy, in patients with known quinine sensitivity, and in patients with glucose-6-phosphate dehydrogenase deficiency. Hemolysis (with the potential for hemolytic anemia) has been associated with a G-6-PD deficiency in patients taking quinine.

PRECAUTIONS: Thrombocytopenic purpura may follow the administration of quinine in highly sensitive patients. Recovery will follow withdrawal of the medication. Cinchona alkaloids, including quinine, have the potential to depress the hepatic enzyme system that synthesizes the vitamin K-dependent factors. The resulting hypoprothrombinemic effect may enhance the action of warfarin and other oral anticoagulants.

ADVERSE REACTIONS: Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. If ringing in the ears, deafness, skin rash, or visual disturbances occur, the drug should be discontinued.

DOSAGE AND ADMINISTRATION: 1 tablet upon retiring. When necessary, 1 additional tablet may be taken following the evening meal.

Product Information as of September, 1977

Hemoccult®

The world's leading full-range test for
fecal occult blood.

Entire Colon —
Hemoccult® test or colonoscopy

8 cm. — Digital examination

25 cm. — Sigmoidoscopy

Routine digital examination explores only 8 cm. of the colon. Sigmoidoscopy reveals an additional 17 cm. But colorectal cancer can occur throughout the colon. And it's often asymptomatic.

That's why the 'Hemoccult' guaiac method is so valuable as a preliminary diagnostic screen. 'Hemoccult' is a reliable detector of blood throughout the colon.

In addition, it's accurate, inexpensive, simple to use and easy to read. The test can be done in the physician's office in minutes, or given to the patient to take home and return by mail.

More than 112,000 cases of colorectal cancer will occur in the United States this year. The earlier they are diagnosed, the greater the chances for successful treatment.

'Hemoccult' is available through local distributors, nationwide.

now proved an effective analgesic for mild to moderate pain

Motrin® Tablets (ibuprofen, Upjohn)

Indications and Usage: Treatment of signs and symptoms of rheumatoid arthritis and osteoarthritis during acute flares and in long-term management. Safety and efficacy have not been established in Functional Class IV rheumatoid arthritis.

Relief of mild to moderate pain.

Contraindications: Individuals hypersensitive to it, or with the syndrome of nasal polyps, angioedema and bronchospastic reactivity to aspirin or other nonsteroidal anti-inflammatory agents (see WARNINGS).

Warnings: Anaphylactoid reactions have occurred in patients with aspirin hypersensitivity (see CONTRAINDICATIONS).

Peptic ulceration and gastrointestinal bleeding, sometimes severe, have been reported. Ulceration, perforation, and bleeding may end fatally. An association has not been established. Motrin should be given under close supervision to patients with a history of upper gastrointestinal tract disease, only after consulting ADVERSE REACTIONS.

In patients with active peptic ulcer and active rheumatoid arthritis, nonulcerogenic drugs, such as gold, should be tried. If Motrin must be given, the patient should be under close supervision for signs of ulcer perforation or gastrointestinal bleeding.

Precautions: Blurred and/or diminished vision, scotomata, and/or changes in color vision have been reported. If these develop, discontinue Motrin and the patient should have an ophthalmologic examination, including central visual fields.

Fluid retention and edema have been associated with Motrin; use with caution in patients with a history of cardiac decompensation.

Motrin can inhibit platelet aggregation and prolong bleeding time. Use with caution in persons with intrinsic coagulation defects and those on anticoagulant therapy.

Patients should report signs or symptoms of gastrointestinal ulceration or bleeding, blurred vision or other eye symptoms, skin rash, weight gain, or edema.

To avoid exacerbation of disease or adrenal insufficiency, patients on prolonged corticosteroid therapy should have therapy tapered slowly when Motrin is added.

Drug interactions. Aspirin: used concomitantly may decrease Motrin blood levels. Coumarin: Bleeding has been reported in patients taking Motrin and coumarin.

Pregnancy and nursing mothers: Motrin should not be taken during pregnancy or by nursing mothers.

Adverse Reactions

Incidence greater than 1%

Gastrointestinal: The most frequent type of adverse reaction occurring with Motrin is gastrointestinal (4% to 16%). This includes nausea,* epigastric pain,* heartburn,* diarrhea, abdominal distress, nausea and vomiting, indigestion, constipation, abdominal cramps or pain, fullness of the GI tract (bloating and flatulence). **Central Nervous System:** Dizziness,* headache, nervousness. **Dermatologic:** Rash* (including maculopapular type), pruritus. **Special Senses:** Tinnitus. **Metabolic:** Decreased appetite, edema, fluid retention. Fluid retention generally responds promptly to drug discontinuation (see PRECAUTIONS).

*Incidence 3% to 9%.

Incidence less than 1 in 100

Gastrointestinal: Upper GI ulcer with bleeding and/or perforation, hemorrhage, melena. **Central Nervous System:** Depression, insomnia. **Dermatologic:** Vesiculobullous eruptions, urticaria, erythema multiforme. **Cardiovascular:** Congestive heart failure in patients with marginal cardiac function, elevated blood pressure. **Special Senses:** Amblyopia (see PRECAUTIONS). **Hematologic:** Leukopenia, decreased hemoglobin and hematocrit.

Causal relationship unknown

Gastrointestinal: Hepatitis, jaundice, abnormal liver function. **Central Nervous System:** Paresthesias, hallucinations, dream abnormalities. **Dermatologic:** Alopecia, Stevens-Johnson syndrome. **Special Senses:** Conjunctivitis, diplopia, optic neuritis. **Hematologic:** Hemolytic anemia, thrombocytopenia, granulocytopenia, bleeding episodes. **Allergic:** Fever, serum sickness, lupus erythematosus syndrome. **Endocrine:** Gynecomastia, hypoglycemia. **Cardiovascular:** Arrhythmias. **Renal:** Decreased creatinine clearance, polyuria, azotemia.

Overdosage: In cases of acute overdosage, the stomach should be emptied. The drug is acidic and excreted in the urine, so alkaline diuresis may be beneficial.

Dosage and Administration: Rheumatoid and osteoarthritis, including flares of chronic disease: Suggested dosage is 300, 400 or 600 mg t.i.d. or q.i.d.

Mild to moderate pain: 400 mg every 4 to 6 hours as necessary for relief of pain.

Do not exceed 2400 mg per day.

Caution: Federal law prohibits dispensing without prescription.

Discipline Commission Action

Editor's Note: On instruction of the Council of the Medical and Chirurgical Faculty of the State of Maryland, "Findings of Fact, Conclusions of Law and Order" will be published in the JOURNAL as cases become final.

IN THE MATTER OF EDWARD E. HOLT, MD, BEFORE THE
COMMISSION ON MEDICAL DISCIPLINE OF MARYLAND

Findings of Fact, Conclusions of Law and Order

Upon certain information coming to its attention and pursuant to Article 43, Section 130 of the Annotated Code of Maryland, the Peer Review Committee of the Medical and Chirurgical Faculty of Maryland initiated an investigation into the medical practice of the Respondent, Edward E. Holt, MD. Thereafter, the Commission on Medical Discipline of Maryland determined to charge Edward E. Holt, MD with certain violations of the Code. The violations charged involve the following subsection of Article 43, Section 130(h):

Professional and mental incompetence.

Appropriate notice of the charges and the grounds from which they arose was given to the Respondent, and a hearing on said charges was held before the Commission on Dec. 19, 1978, before John E. Adams, MD, Chairman; Jerome J. Collier, MD; John Ball, MD; Karl F. Mech, MD; Francis Mayle, Jr., MD; Frank Shipley, MD; Arthur Keefe, MD, and Vincent J. Fiocco, MD, constituting a quorum of the Commission. The Respondent appeared, represented by Charles P. Howard, Jr., Esquire. Stephen J. Sfekas Assistant Attorney General, presented the case on behalf of the Commission. Jack C. Tranter, Assistant Attorney General, advised the Commission on Rules of evidence.

At the time of the hearing, Mr. Sfekas presented Kennard Yaffee, MD, a member of the Peer Review Committee of the Baltimore City Medical Society, as a witness. A report of the Family Practice Unit of the University of Maryland Medical School was also presented.

The Dec. 19, 1978 meeting was continued to Jan. 2, 1979. At that time, the Respondent, after consulting with counsel, agreed to plead guilty and to enter into a Consent Order as proposed by the Commission.

Findings of Fact

The Commission finds

1. That the Respondent lacks sufficient knowledge and ability to engage in the independent practice of medicine.
2. That the Respondent has a significant degree of organic brain disease which contributes to his inability to engage in the independent practice of medicine.

The Commission, therefore, concludes as a matter of law that the Respondent is guilty of the charges of professional and mental incompetence.

Order

UPON the foregoing Findings of Fact and Conclusions of Law, it is this 2nd day of January, 1979, by the unanimous vote of the members of the Commission on Medical Discipline hearing this case

ORDERED that the license to practice medicine and surgery in the State of Maryland heretofore issued to the Respondent, Edward E. Holt, MD, by the Board of Medical Examiners, is hereby REVOKED; and, be it further

ORDERED that the aforesaid revocation shall not be effective until March 4, 1979 in order to permit the Respondent to make alternate arrangements for his patient's care, and be it further

ORDERED that after March 4, 1979 if the Respondent enters into a totally supervised medical practice acceptable to the Commission, the Commission shall stay the revocation of his license and place him on probation subject to the following conditions:

1. That Respondent practice only in a totally supervised setting approved by the Commission.
2. That Respondent's supervisor or preceptor submit quarterly reports to the Commission.

3. That Respondent continue in treatment with Addison W. Pope, MD or some other physician acceptable to the Commission.

4. That the physician treating Respondent submit quarterly reports to the Commission, and be it further

ORDERED that in the event the Respondent's revocation is stayed and he is placed on probation, violation of any of the foregoing conditions of probation, submission of a report by his supervisor or preceptor indicating that he is not practicing medicine competently or submission of a report by his personal (treating) physician indicating that he is not physically or mentally capable of practicing medicine competently may result in the withdrawal of the stay of the revocation of his medical license. Such action may only be taken following notification to the Respondent and a hearing before the Commission and be it further

ORDERED that if Respondent's revocation is stayed and he is placed on probation, two years from the date of this Order the Commission will entertain a petition to reinstate the Respondent's medical license without any condition or restriction whatsoever or alternatively to modify any of the foregoing conditions, and be it further

ORDERED that a copy of this Order be filed with the Board of Medical Examiners of Maryland in accordance with the Maryland Code, Article 43, Section 130(m).

JOHN E. ADAMS, MD, Chairman
Commission on Medical Discipline

Consent

By this Consent, I hereby accept and submit to the foregoing Order and its conditions. I acknowledge the validity of the Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony and to call witnesses in my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my rights to appeal any adverse ruling of the Commission that might have followed any such hearing. I further recognize that in the event I am able to effect a stay of the revocation of my medical license, failure to abide by the conditions of the resulting probation may result in the withdrawal of the stay and the reimposition of the revocation of my medical license.

I sign this Consent without reservation, fully understanding its meaning and after consultation with my counsel.

EDWARD E. HOLT, MD

STATE OF MARYLAND, CITY/COUNTY OF Baltimore to wit:

I HEREBY CERTIFY, that on this _____ day of _____, 1979, before me, the subscriber, personally appeared EDWARD E. HOLT, MD, and he made oath in due form of law that the foregoing Consent is his voluntary act and deed.

AS WITNESS my hand and Notarial Seal.

Notary Public

IN THE MATTER OF SHIN EUNG KIM, MD BEFORE THE
COMMISSION ON MEDICAL DISCIPLINE OF MARYLAND

Order

By letter dated Dec. 8, 1978, Shin Eung Kim, MD (the "Respondent") through his attorney, John H. Doud III, Esquire, petitioned for reinstatement of his license to practice medicine and surgery in Maryland. As a result of that request the Commission on Medical Discipline of Maryland (the "Commission") met with the Respondent and his attorney on Jan. 2, 1979 to consider that request. Based on that meeting and the materials presented, the Commission makes the following findings of fact.

1. That by Order dated Feb. 10, 1978, the Respondent's license to practice medicine and surgery in Maryland was revoked.

2. That the Feb. 10, 1978 Order provided that the revocation would be stayed upon certain conditions.

3. That Dr. Kim consented to the entry of the Feb. 10, 1978 Order.

4. That Dr. Kim entered a training program at the Robinson Memorial Hospital in Ravenna, OH which program was approved by the Commission.

5. That by letter dated Dec. 27, 1978, D. B. Fraatz, MD, Director of Medical Education, Robinson Memorial Hospital, Ravenna, OH, advised the Commission that the Respondent's performance in the approved residency program was satisfactory and that in his opinion the Respondent is a competent general practitioner.

6. That by letter dated Dec. 1, 1978, the Respondent was advised that he had successfully completed the American Board of Family Practice certifying examination which he took on Aug. 26-27, 1978, and that he is now a Diplomate of the American Board of Family Practice.

Upon the foregoing findings of fact, it is this 2nd day of January, 1979 by the unanimous vote of the members of the Commission on Medical Discipline hearing this case

ORDERED that the Feb. 10, 1978 revocation by the Commission of the Respondent's medical license is hereby stayed and Respondent is hereby placed on probation upon the following condition:

1. That the Respondent shall submit to reviews of his practice by the Allegheny County Medical Society, such reviews to be conducted six and eighteen months following the date of this Order;

ORDERED that if the Respondent violates the aforesaid condition of probation or if a report submitted to the Commission by the Allegheny County Medical Society following a review of his practice indicates that he is not practicing medicine in a competent fashion, upon notification by and a hearing before the Commission, the aforesaid stay of the revocation of the Respondent's medical license may be withdrawn, and be it further

ORDERED that two years from the date of this Order the Commission will entertain a petition to reinstate Respondent's medical license without any restriction or condition whatsoever; and be it further

ORDERED that a copy of this Order shall be filed with the Board of Medical Examiners in accordance with Maryland Code, Article 43, Section 130(n).

JOHN E. ADAMS, MD, Chairman
Commission on Medical Discipline

IN THE MATTER OF KARL K. NAMVARY, MD BEFORE THE
COMMISSION ON MEDICAL DISCIPLINE OF MARYLAND

Findings of Fact, Conclusions of Law and Order

Upon certain information coming to its attention pursuant to the provisions of Article 43, §130 of the Annotated Code of Maryland, the Physician/Patient Relations Committee of the Medical and Chirurgical Faculty, the state medical society, and the Harford County Medical Society conducted investigations into the medical practice of Karl K. Namvary, MD (the "Respondent"). Thereafter, the Commission on Medical Discipline of Maryland (the "Commission") after considering the reports and recommendation submitted, determined to charge the Respondent with violation of the following subsection of Article 43, §130(h):

(4) The physician has been charged with a crime involving moral turpitude, and has entered a nolo contendere or guilty plea or has been convicted of the crime.

Appropriate notice of the charge and the ground from which it arose was given to the Respondent and a hearing on said charges was held on Jan. 16, 1979. The following members of the Commission were present at the hearing: John E. Adams, MD; Jerome J. Coller, MD; Vincent J. Fiocco, Jr., MD; Arthur T. Keefe, MD; Eli M. Lippman, MD; Karl F. Mech, MD and Francis C. Mayle, Jr., MD. John E. Adams, MD presided as Chairman of the Commission. Also present were Jack C. Tranter, Assistant Attorney General, to advise the Commission as to rules of evidence, and Stephen J. Sfekas, Assistant Attorney General to present the case on behalf of the Commission. The Respondent appeared represented by Russell J. White, his counsel.

Following introductions, Mr. Sfekas proceeded to present the case on behalf of the Commission. After introducing the following documentary evidence, Mr. Sfekas rested the Commission's case:

State's Exhibit No. 1—Certified copies of the docket entries in *State v. Karl K. Namvary*, Circuit Court for Harford County, MD, Case 5952.

Mr. White then proceeded to present the case on behalf of the Respondent. Testimony was heard from the Respondent, Edward J. Simon, MD and a proffer as to the testimony of Frederick J. Hatem, MD was verified by a telephone call placed by Eli M. Lippman, MD, a Commission member. The following documentary evidence was also produced:

Respondent's Exhibit No. 1—Packet of 51 letters (originals and copies) from physicians and other health care providers regarding the Respondent.

Following closing arguments, at the Commission's request, Mr.

White agreed to furnish the Commission with a copy of the transcript of **State v. Karl K. Namvary**, Circuit Court for Harford County, Maryland, Case No. 5952, for review by the Commission. After this discussion, the hearing was concluded.

Findings of Fact

The Commission finds:

1. That the Respondent was convicted in the Circuit Court for Harford County, MD of 38 counts of the crime of false pretenses (Article 27, Section 140 of the Annotated Code of Maryland).
2. That on May 5, 1978, the Court of Special Appeals affirmed the Respondent's conviction.
3. That the Respondent is Board certified in his specialty and appears to be a competent practitioner.

Conclusions of Law

Based upon the foregoing Findings of Fact, the Commission concludes as a matter of law that the Respondent's conviction of 38 counts of the crime of false pretenses is a conviction of a crime involving moral turpitude. Accordingly, the Commission adjudicates Respondent **GUILTY** of that charge.

Order

From the foregoing Findings of Fact and Conclusions of Law, it is this 6th day of March, 1979, by the unanimous vote of those members of the Commission hearing this case:

ORDERED that the license to practice medicine and surgery heretofore issued to the Respondent by the Board of Medical Examiners is hereby **REVOKED** and be it further

ORDERED that the aforesaid revocation shall be immediately **STAYED** with the Respondent placed on **PROBATION** subject to the following conditions:

1. That the Respondent shall provide eight hours of free service per week for a period of 52 consecutive weeks in a manner and at a medical facility designated by the Commission,
2. That the Respondent shall satisfactorily perform the aforementioned free medical services.
3. That the Respondent shall submit written evidence suitable to the Commission that the aforementioned free medical services are being satisfactorily performed.
4. That the Respondent shall begin the provision of the aforementioned free medical services within four weeks from the date the Commission designates the place for and manner of the provision of such free medical services.
5. That the Respondent shall not engage in activities of the type that led to his criminal conviction.
6. That the Respondent's practice shall be in accordance with those standards expected from a competent practitioner of medicine in the State of Maryland; and be it further

ORDERED that if the Respondent violates any of the foregoing conditions of probation, the Commission may, after notification and a hearing, withdraw the stay of the revocation of his medical license or impose any other disciplinary sanction it deems appropriate and be it further

ORDERED that the Respondent's probationary status shall continue for a period of five years after which the Respondent's license shall be automatically reinstated without any condition or restriction whatsoever, if he successfully completes the terms of his probation. In that regard, following the satisfactory completion of the aforementioned free medical services by the Respondent, the Commission will entertain a petition to terminate the Respondent's probationary status and to reinstate his medical license without any restriction or condition whatsoever and be it further

ORDERED that a copy of this Order shall be filed with the Board of Medical Examiners in accordance with the Annotated Code of Maryland, Article 43, Section 130(n).

Motorcyclists Urged to Wear Safety Helmets

Motorcycle crash deaths are increasing sharply in the wake of at least 23 states overturning laws requiring riders to wear safety helmets, the American Medical Association pointed out recently.

All motorcyclists should wear properly fitted, full-facial coverage helmets, the AMA has advised the American public. This policy was reaffirmed by the AMA's House of Delegates in a report adopted at the Annual Convention in June, 1979 in St. Louis, MO. Moped riders should also wear helmets, the AMA urged.

The report originated in a conference on head protection for the cyclist held by the AMA last year in Washington, DC.

With increased helmet usage in the 1960s, head-related fatalities among motorcyclists dropped 40%, but the Highway Safety Act of 1976 removed the authority of the US Secretary of Transportation to require mandatory use of helmets. Consequently, many states repealed their helmet laws, and fatalities have now risen precipitously, to some 4,000 each year, the AMA has pointed out.

Opponents of mandatory helmet laws have maintained that helmets restrict vision and impair hearing. Neither contention has been found valid, the AMA declared. The full-facial coverage helmet allows peripheral vision of 180°, well above the 140° that most states require for licensure to drive an automobile. There is no scientific evidence to support the contention that the helmet dangerously impairs hearing, the AMA said, pointing out that the loud noise of the motorcycle itself blocks out most other sound.

Since the advent of the motorcycle, physicians and researchers interested in reducing death and injury from motor vehicle crashes have been concerned about the tremendous number of fatalities and serious head injuries resulting from motorcycle crashes, the AMA House of Delegates declared.

In recent years, this concern has been intensified because of the significant rise in numbers of cycles, following the introduction of lighter, less-costly vehicles and their use as an economical means of transportation in the current energy crisis.

About 80% of motorcycle crash injuries are to the head, and the chance of being killed is two-thirds greater for the unhelmeted cyclist, the AMA said.

A copy of the AMA conference report, **Head Protection for the Cyclist**, can be obtained without charge from the AMA, 535 N. Dearborn St., Chicago, IL 60610. □

Americans Entering New Era of Melancholy

America may be entering a new era of melancholy just like the Middle Ages, says a recent AMA report.

Danielle Turns, MD, Associate Professor of Psychiatry at University of Louisville, said the prevalence of affective illness appears to be rising and probably 17% of the US population suffers from it at present.

The chance of someone who lives to age 70 contracting depression during his or her lifetime is now 7.8% for males and 20% for females, Dr. Turns said. She speculated that such factors as increased personal expectations with accompanying greater disillusionment if the expectations are not met may be at the root of the increase. But it would be unusual if a person did not experience occasional minor degrees of depression, she said.

Prevention has not been successful for mental illness, Dr. Turns declared. Heredity, personality type and early life experiences all are involved. More females than males suffer from it, by a ratio of three to one.

It is frequently difficult to determine if emotional illness results from or causes a major life change, she said. A patient may lose a job and become depressed; conversely, depression and poor work performance may cause unemployment. □

Surgical Judgment in Emergency Surgery for Blunt Trauma With Associated Medical Pathology: Case Reports

By AMI ASZODI, MD; R.A.M. MYERS, MB ChB (Witwatersrand) and FRCS (Edinburgh) and RA. COWLEY, MD

For reprint and other data, contact Dr. Cowley at the Maryland Institute for Emergency Medical Services (MIEMS), 22 S. Green St., Balt., MD 21201.

Summary

This paper addresses the dilemma facing the trauma surgeon when an expected medical condition or developmental anomaly is discovered during the routine workup and treatment of blunt abdominal trauma. Variable conditions are discussed and management of each outlined. The final decision which requires good judgment rests with the operating surgeon.

Introduction

The patient population treated at the Maryland Institute for Emergency Medical Services, (MIEMS) are almost exclusively post-trauma victims. The majority of these patients are due to blunt trauma as a result of automobile traffic accidents. The mini-laparotomy with peritoneal lavage has been used as the primary method of diagnosing hemoperitoneum.

Incidental surgical procedures during laparotomy are well recognized and highly controversial. These may be related to surgical technical error, e.g.; splenectomy, result of spleen laceration in vagotomy or gastric surgery. They can be unrelated, but with some possible later benefit, such as appendectomy, cholecystectomy or Meckel's diverticulectomy.

Five patients with blunt abdominal trauma, all requiring laparotomy for hemoperitoneum with complicating medical diseases or anomalies, are presented with discussion of the dilemma confronting the surgeon.

Patient Reports

A 25-year-old male was involved in a motorcycle accident with blunt abdominal and lower limb trauma. Mini laparotomy revealed a hemoperitoneum. As-

sociated injuries included bilateral mid-shaft femur fractures. Blood pressure was 105/75, pulse 130, hemoglobin 10.8 gm.%. Past history revealed chronic active hepatitis, confirmed by liver biopsies over the past 10 years. Drug therapy consisted of Imuran (Azathioprine) and steroids. On two occasions, he had endoscopically proven, bleeding esophageal varices extending from the mid-esophagus to gastric cardia.

At laparotomy, a ruptured enlarged spleen was found with over 500 cc's of free blood in the peritoneal cavity. Dilated collateral veins were evident around the stomach, liver, anterior abdominal wall and omentum. A firm, greenish, discolored but not macroscopically nodular cirrhotic liver was present. The fractured

spleen was resected and the splenic vein was preserved and dissected off the pancreas. An end to side spleno-renal shunt was performed with a pressure drop of 19 cm. H₂O post-shunt. Preoperative pressure was 37 cm. H₂O and postoperative pressure was 18 cm. H₂O. Liver biopsies were taken from multiple sites. The fractured femurs were plated during the same operation. Post-operatively, his bilirubin levels rose to 35 mg.% but by discharge had fallen to 19 mg.%. Five months after surgery, he died from liver failure. At postmortum, the shunt was patent.

Comment

The general surgical literature indicates that after the first documented variceal bleeding in patients with portal hypertension, an elective portosystemic shunt should be undertaken.¹

Orloff² showed that 93% of variceal bleeding not submitted to shunting procedures re-bled. Of these cases, 74% died from subsequent hemorrhage. Properly performed patent portal systemic shunts will protect 90% of patients from subsequent variceal bleeding.¹

The incidence of post-shunt protein-related portal systemic encephalopathy is lowest in spleno-renal shunts;¹ however, this type of shunt does not decompress the portal bed as efficiently as a portocaval shunt and has an associated 19% recurrence of bleeding and thrombosis.³

This patient had been prepared for an elective portocaval shunt prior to the accident. As a direct consequence of the injury, the ruptured spleen could not be used and thus the distal Warren type of shunt could not be undertaken. Rather than lose the splenic vein from thrombosis, it was felt that the spleno-renal shunt would be technically the least invasive and time-consuming and the easiest and most effective shunt to perform. Should thrombosis occur, other shunts could still be undertaken.

The insult of extensive trauma with multiple in-

juries, severe bleeding into the fracture sites, shock and hypoxia all portended a complicated post operative period in an already compromised (cirrhotic) patient. Blood transfusions, hypoxia and drugs intra- and post-operatively could further strain the disturbed liver function. Thus, with the problem of losing the splenic vein post-splenectomy (through thrombosis) and the increased stress on the liver, it was elected to do the shunt as part of the emergency procedure.

Macpherson and Goddard⁴ have shown that lienorenal shunts are followed by significantly less recurrent bleeding and a longer survival rate than by splenectomy alone. The duration of survival rate after each operation was significantly influenced by the severity of the hepatic dysfunction at the time it was performed.

A 36-year-old male was involved in a motor accident sustaining blunt abdominal trauma and a whiplash neck injury. Cervical spine X-rays showed a fractured C-3 and C-4 with minimal displacement without neurological involvement. Blood pressure was 100/80, pulse 108, hemoglobin 13.2 gm.%, white count 18,200 and platelets 365,000. Mini-laparotomy revealed a hemoperitoneum. Family history, revealed evidence of hereditary spherocytosis. Peripheral blood smear supported this diagnosis.

Cervical traction with Halo Crutchfield thongs traction frame was applied before submitting the patient to laparotomy. A small, two mm. shallow capsule laceration of the spleen was found with some 100 cc's of blood in the peritoneal cavity. There was no active bleeding at the time. A splenectomy was performed and the post-operative recovery was uneventful. Spherocytosis was confirmed by osmotic fragility tests in the postoperative period.

Comment

The operative mortality rate of splenectomy for rupture of the spleen alone due to non-penetrating injury varies from 0-20%. Shirley's⁵ series showed an overall mortality of 9-22% for isolated injury. Mortality rate is proportional to the number of associated injuries and can reach up to 60% when five associated organs were injured.⁶

In children, it has been shown that postsplenectomy systemic infections, especially pneumococcal, are significant.⁷⁻⁸ The overwhelming sepsis post-splenectomy in children with Hodgkin's disease was up to 20% with a 50% mortality.⁹

With minimal splenic injury (Patient #2), it may have been possible not to remove the spleen and a strong argument can be made for this course of action in a hematologically normal person;¹⁰⁻¹² however, it was felt that removal of the spleen would effect a cure for the diagnosed spherocytic anemia. Hereditary spherocytosis or familial acholuric jaundice is the most common type of congenital hemolytic anemia of those of European descent. It affects both sexes equally and is due to a Mendelian dominant inheritance. The intrinsic problem is an abnormality of erythrocytes resulting in a spherical shape with increase permeability of the cell membrane to sodium and a loss of surface lipid. The spherocytes are selectively trapped in the splenic pulp.

The treatment of the condition is splenectomy, unless completely asymptomatic and a fully compensated hemolytic state exists. There is, however, an increased risk of gallstones. The splenectomy will abolish hyperhemolysis and cure the anemia, but does not affect the spherocytes.

Today the role of the spleen in infection control in adults is not clearly understood. Time may prove a similarly important role in adults as it has in children.

A 26-year-old male suffered blunt lower chest and abdominal trauma from a steering wheel motor vehicle accident. He demonstrated respiratory distress with a PaO₂ of 65 mm. Hg. and PaCO₂ of 52 mm. Hg., pulse 116 and blood pressure 100/75. There was marked left-sided upper abdominal tenderness and a positive mini-laparotomy for blood. Hemoglobin 11.2 gms.%, white count 11,000, platelets 350,000. A chest tube was inserted in the left side preoperatively. Laparotomy revealed a ruptured spleen and narrow-necked Meckel's diverticulum. Splenectomy was performed. Because of the unstable condition of the patient with pulmonary contusion, it was elected not to perform a diverticulectomy although with a narrow neck and the possibility of ectopic gastric mucosa, there was the potential for post-operative complications.

The postoperative course was relatively uneventful with four days of ventilation on positive expiratory pressure (PEEP) of 10 cm. for the pulmonary contusion. Daily serial blood gases indicated a definite improvement in the lung contusion. A postoperative technetium scan was suspicious for ectopic gastric mucosa. He was laparotomized three weeks later and a Meckel's diverticulectomy and appendectomy were performed. The postoperative period was uneventful.

Comment

Meckel's diverticulum is not a benign anomaly. The average mortality is about 6 percent,¹⁻¹¹ most of this in the elderly. Complications are much more likely in childhood than later and consist of the following groups: inflammatory peptic, obstructive, umbilical and tumor. In the peptic group, acute perforation may result with localized abscess or generalized peritonitis. Hemorrhage may be severe and is always acute, but chronic anemia from occult bleeding is rarely seen; 90% have ileum lining, 10% may have gastric, duodenal or colonic mucosa or pancreatic tissue. In reported series, bleeding is the most common complication (50%).^{1,11,13} Complications are relatively uncommon, but the diverticulum is a potential source of danger to the patient and should be excised whenever possible.^{1,11}

An unstable intraoperative respiratory condition due to pulmonary contusion made the extension of the operative time unwarranted. A later technetium scan showed the presence of gastric mucosa in the diverticulum and an elective diverticulectomy was performed after due consideration to the complications of a second anesthesia, a recovering contused lung and bowel resection with anastomosis.

A 19-year-old male was involved in a motorcycle

accident with blunt abdominal trauma which produced a positive mini laparotomy. Radial artery cannulation was used for monitoring as it was technically not possible to cannulate the femoral vessels. (Routine femoral artery catheterization is used here for patient monitoring.)

Associated injuries included a fracture of the distal third of the left clavical with an upper root brachial plexus injury (Cervical 5 and 6) and multiple lacerations of the limbs.

At laparotomy, a laceration of the liver was found. It was also noted that aortic pulsations were reduced. Femoral pulses were weaker than the radials. Because of concern of a ruptured thoracic aorta (high speed motor accident) amniography was undertaken immediately on completion of the laparotomy. This revealed a coarctation of the thoracic aorta at the level of T-4 with no evidence of rupture. No further surgery was undertaken. The patient was scheduled for elective surgery, but has been lost to follow-up.

Comment

The most satisfactory age for operating on a coarctation of the aorta is between age 6-16 years. As the patient's age increases, the operation becomes technically more difficult due to a less elastic and more sclerotic aorta. There are more aneurysms of the intercostal arteries and a fixed type of hypertension responding less after the relief of the aortic obstruction. The operative risk rises from 7% in the 6-16 year group to over 10% in older patients.¹ Routine diagnostic studies led to the detection of the disease allowing relatively early correction.

Twenty-four hours prior to admission, a 21-year-old male suffered blunt abdominal trauma after a fall. Due to language difficulty, the history was inadequate. The patient appeared to have severe upper abdominal tenderness with board-like rigidity and on X-ray free air under the diaphragm. A tentative diagnosis of perforated duodenum was made. Temperature 103.4 degrees F., pulse 130, respiration 38 and BP 202/96, Hb 17.4 gms. percent and WBC 12,900.

At laparotomy, a perforation of the mid-jejunum was found with two liters of intraperitoneal intestinal fluid. Also discovered was an incomplete rotation of the midgut with the appendix lying posterior to the right lobe of the liver. The perforation was repaired, an appendectomy performed and the peritoneal cavity well irrigated before closing.

Postoperatively, he was treated with antibiotics and developed a cystic collection of fluid in the pelvis. This was aspirated and found on culture to be sterile. He was discharged after two weeks of hospitalization.

Comment

Hewitt et al¹⁴ determined that in early childhood almost one person in six could be expected to undergo primary appendectomy for suspected appendicitis. Lawrence et al¹⁴ showed that the expectation of appendicitis in a person 28 years old is 1:18. Justification of the appendectomy obviously assumes that the satisfactory condition of the patient will not be compromised by

additional operative time and theoretical risk of contamination. Appendectomy is part of the treatment for malrotation. The diagnostic problems of a malpositioned appendix with subsequent compromise to the patient's life from misdiagnosis are well appreciated.

Conclusion

The trauma surgeon is often face with difficult, and at times, controversial decisions during his surgical endeavors to reasonably and responsibly treat patients suffering from blunt abdominal trauma. Five patients were operated upon with a varied assortment of unexpected or complicated disease conditions.

Maryland Hospital News

Sports Medicine Center Opens at Union Memorial

Union Memorial in Baltimore has announced the opening of its Sports Medicine Center. Under the direction of **William H. B. Howard**, MD, the Center is comprised of medical and educational components designed to provide treatment of and information about athletic injuries.

The hospital, surrounded by numerous schools, universities, Memorial Stadium and residential communities, has always been a focal point for the treatment of a wide variety of athletic injuries. For many years, however, sports medicine problems have been treated in various areas of the hospital by numerous physicians, but without overall coordination.

Most athletes and their coaches want immediate care so that the injury is not aggravated and the athlete can return either to competition or to the pursuit of his/her athletic activities as soon as possible. Union Memorial's Sports Medicine Center has centralized all of its specialists and facilities in one area to expedite care of the injured athlete.

The Sports Medicine Center Clinic is held at the hospital on Mondays and Thursdays from 3-5 PM. Patients may be self-referred or referred by their physician, school, coach, trainer, etc. The purpose of the Center is not to replace private or team physicians, but to assist them.

Students, sports enthusiasts, joggers and weekend athletes of all ages will find a full range of services available including evaluation, treatment and follow-up from the Clinic's staff. Members of the staff have particular interest in sports medicine and have lectured and written exclusively on the subject. At every session are attending physicians in general surgery, orthopedic surgery and radiology. Nurses and physical therapists are present to assist in the treatment of the athlete. Cardiologists and gynecologists are on call, should

their consultation be needed. Diagnostic tests such as X-rays and laboratory studies that are needed are performed on the same day. The injured athlete has the benefit of all of these specialists and tests during the same visit.

At the end of the visit, Center physicians explain the diagnosis and suggest treatment to the patient. In addition, recommendations are given for return to activity and follow-up visits, if necessary.

Registration for the Sports Medicine Center is in the hospital's Emergency Department on Calvert St. at 34th St.

The Sports Medicine Center will feature educational programs throughout the year. Last year, Union Memorial cosponsored an all-day Sports Medicine Seminar with the Johns Hopkins University, featuring physicians, coaches and trainers from all over the country.

For further information or scheduling of appointments at the Union Memorial Sports Medicine

Center, call (301) 235-7200, Ext. 2253. □

UMH Doctors Receive Award

John N. Classen, MD, Vascular Surgeon, and **A. Allan Genut**, MD, Neurologist, were recently presented with the Union Memorial Hospital Golden Apple Award, which was developed by the Hospital's House Staff to honor attending physicians for excellence, effort and enthusiasm in teaching. Drs. Classen and Genut are the recipients of the first Golden Apple Awards.

For the last three decades, Dr. Classen has been in integral part of the surgical training program at the Hospital and has served as Chief of Surgery.

The House Staff explained that Dr. Classen was tireless in his teaching efforts and never too busy to give assistance. In the Emergency Department, Vascular Clinic and Diabetic Foot Clinic, he was available for consultation and freely gave residents the benefits of his

RODNEY SCHLEGEL, left, and **Dr. WILLIAM HOWARD**, Medical Director of the Sports Medicine Center at UMH, examine the ankle of a SMC patient.

years of experience. Besides his affiliation at UMH, Dr. Classen is also an Assistant Professor at the Johns Hopkins Hospital School of Medicine.

Dr. Genut came to UMH in 1975 after serving as Chief Resident in Neurology at University Hospital in Baltimore, and is Chief of the Neurology Section in the Department of Medicine.

In accepting the award, he stated that it was "The biggest honor of my life." Dr. Genut said that he considers himself to be both a teacher and physician. No one doubts this observation, especially if you count the endless hours he has spent trying to explain the mysteries of neurology to the House Staff.

Soft-spoken and usually surrounded by a cloud of pipe smoke,

Dr. Genut was singled out because of his "Presenting excellent teach-

ing conferences" and his "teaching around the clock." □

Woodburning - Energy Independence for America

When you consider energy costs today, it's easy to understand why thousands of Maryland homeowners have turned to Fisher® Woodstoves. Fisher Stoves can save up to 75% on your heating bills and will burn 18 to 24 hours on one fueling of coal or wood. Fisher Stoves are firebrick lined, guaranteed for five years, virtually airtight, and have patented Spin Draft Air Controls. These features make Fisher the highest quality, American-made woodstove; the original, not a copy.

At BAUMGARDNERS', you can choose from sixteen models and ten eye-pleasing colors of Fisher® Woodstoves in both stove and fireplace models. The new Fireplace Insert model can make your existing fireplace ten times more efficient. We can answer any questions you may have regarding heating with wood. Keep in mind that we also sell custom-fitted Glass Fireplace Doors, Chimney Systems, fireplace toolsets and more... everything you need for your fireplace or woodstove to warm and beautify your home.

Fisher® Stoves - An idea America is warming up to.

Surgical Treatment for Rheumatoid Arthritis of the Hand

by Homer C. House, MD and J. B. Desilva, MD

Librax®

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium Br

Please consult complete prescribing information, a summary of which follows:

Indications: Based on a review of this drug by the National Academy of Sciences—National Research Council and or other information, FDA has classified the indications as follows.

"Possibly" effective as adjunctive therapy in the treatment of peptic ulcer and in the treatment of the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

Final classification of the less-than-effective indications requires further investigation

Contraindications: Glaucoma, prostatic hypertrophy, benign bladder neck obstruction, hypersensitivity to chlordiazepoxide HCl and or clidinium Br

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants, and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Physical and psychological dependence rarely reported on recommended doses, but use caution in administering Librium® (chlordiazepoxide HCl Roche) to known addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions) reported following discontinuation of the drug

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy. Advise patients to discuss therapy if they intend to or do become pregnant.

As with all anticholinergics, inhibition of lactation may occur

Precautions: In elderly and debilitated, limit dosage to smallest effective amount to preclude ataxia, oversedation, confusion (no more than 2 capsules day initially, increase gradually as needed and tolerated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider pharmacology of agents, particularly potentiating drugs such as MAO inhibitors, phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions reported in psychiatric patients. Employ usual precautions in treating anxiety states with evidence of impending depression, suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship not established

Adverse Reactions: No side effects or manifestations not seen with either compound alone reported with Librax. When chlordiazepoxide HCl is used alone, drowsiness, ataxia, confusion may occur, especially in elderly and debilitated; avoidable in most cases by proper dosage adjustment, but also occasionally observed at lower dosage ranges. Syncope reported in a few instances. Also encountered: isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent, generally controlled with dosage reduction. Changes in EEG patterns may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice, hepatic dysfunction reported occasionally with chlordiazepoxide HCl, making periodic blood counts and liver function tests advisable during protracted therapy. Adverse effects reported with Librax typical of anticholinergic agents, i.e., dryness of mouth, blurring of vision, urinary hesitancy, constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and or low residue diets

Brief Summary

INDICATIONS

Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the following indications as "probably" effective:

For the treatment of functional bowel/irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

THESE FUNCTIONAL DISORDERS ARE OFTEN RELIEVED BY VARYING COMBINATIONS OF SEDATIVE, REASSURANCE, PHYSICIAN INTEREST, AMELIORATION OF ENVIRONMENTAL FACTORS.

For use in the treatment of infant colic (syrup).

Final classification of the less-than-effective indications requires further investigation.

CONTRAINDICATIONS: Obstructive uropathy (for example, bladder neck obstruction due to prostatic hypertrophy); obstructive disease of the gastrointestinal tract (as in achalasia, pyloroduodenal stenosis); paralytic ileus, intestinal atony of the elderly or debilitated patient; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; myasthenia gravis. **WARNINGS:** In the presence of a high environmental temperature, heat prostration can occur with drug use (fever and heat stroke due to decreased sweating). Diarrhea may be an early symptom of incomplete intestinal obstruction, especially in patients with ileostomy or colostomy. In this instance treatment with this drug would be inappropriate and possibly harmful. Bentyl may produce drowsiness or blurred vision. In this event, the patient should be warned not to engage in activities requiring mental alertness such as operating a motor vehicle or other machinery or perform hazardous work while taking this drug. **PRECAUTIONS:** Although studies have failed to demonstrate adverse effects of dicyclomine hydrochloride in glaucoma or in patients with prostatic hypertrophy, it should be prescribed with caution in patients known to have or suspected of having glaucoma or prostatic hypertrophy. Use with caution in patients with: Autonomic neuropathy. Hepatic or renal disease. Ulcerative colitis. Large doses may suppress intestinal motility to the point of producing a paralytic ileus and the use of this drug may precipitate or aggravate the serious complication of toxic megacolon. Hyperthyroidism, coronary heart disease, congestive heart failure, cardiac arrhythmias, and hypertension. Hiatal hernia associated with reflux esophagitis since anticholinergic drugs may aggravate this condition.

Do not rely on the use of the drug in the presence of complication of biliary tract disease. Investigate any tachycardia before giving anticholinergic (atropine-like) drugs since they may increase the heart rate. With overdosage, a curare-like action may occur. **ADVERSE REACTIONS:** Anticholinergics/antispasmodics produce certain effects which may be physiologic or toxic depending upon the individual patient's response. The physician must delineate these. Adverse reactions may include xerostomia; urinary hesitancy and retention; blurred vision and tachycardia; palpitations; mydriasis; cycloplegia; increased ocular tension; loss of taste; headache; nervousness; drowsiness; weakness; dizziness; insomnia; nausea; vomiting; impotence; suppression of lactation; constipation; bloated feeling; severe allergic reaction or drug idiosyncrasies including anaphylaxis; urticaria and other dermal manifestations; some degree of mental confusion and/or excitement, especially in elderly persons; and decreased sweating. With the injectable form there may be a temporary sensation of lightheadedness and occasionally local irritation. **DOSAGE AND ADMINISTRATION:** Dosage must be adjusted to individual patient's needs.

Usual Dosage: Bentyl 10 mg. capsule and syrup: **Adults:** 1 or 2 capsules or teaspoonfuls syrup three or four times daily. **Children:** 1 capsule or teaspoonful syrup three or four times daily. **Infants:** ½ teaspoonful syrup three or four times daily. (May be diluted with equal volume of water.) Bentyl 20 mg.: **Adults:** 1 tablet three or four times daily. Bentyl Injection: **Adults:** 2 ml. (20 mg.) every four to six hours intramuscularly only. **NOT FOR INTRAVENOUS USE. MANAGEMENT OF OVERDOSE:** The signs and symptoms of overdose are headache, nausea, vomiting, blurred vision, dilated pupils, hot, dry skin, dizziness, dryness of the mouth, difficulty in swallowing, CNS stimulation. Treatment should consist of gastric lavage, emetics, and activated charcoal. Barbiturates may be used either orally or intramuscularly for sedation but they should not be used if Bentyl with Phenobarbital has been ingested. If indicated, parenteral cholinergic agents such as Urecholine® (bethanechol chloride USP) should be used.

Product Information as of October, 1978.

Doctors in the News

Dr. Sherman Elected

Michael L. Sherman, MD has been elected President of the Maryland Radiological Society, succeeding **Dr. George Burke**. The Society is the professional organization for the state's radiologists.

Certified by the American Board of Radiology, **Dr. Sherman** holds clinical appointments in the Departments of Radiology at the Johns Hopkins and the University of Maryland Hospitals. He is on the attending staff of Franklin Square and also consults at the James Lawrence Kernan Hospitals.

The Society's new President received his Medical Degree from the University of Maryland, where he also completed his radiologic training.

In 1972, he entered the private practice of radiology with Drs. Copeland, Hyman and Shackman, PA.

Other officers recently elected are **Dr. James E. Bell**, President-Elect; **Dr. Niel Borrelli**, Treasurer and **Dr. Stanford Goldman**, Secretary.

Dr. Gray Named

Herbert A. Kushner, MD, Chief of Medicine at Lutheran Hospital of Maryland, Inc., has named **Darrell M. Gray, MD**, as Assistant Chief of the Department.

Dr. Gray, who is a native of Baltimore, did his undergraduate work at John Hopkins University, followed by medical studies at the University of Maryland and a Residency at University Hospital, completed in 1979.

As part of his Residency program, **Dr. Gray** worked to establish an outreach medical clinic in the medically-underserved areas of West Virginia and Cumberland and continues as a consultant to that program.

In addition to his position at Lutheran, **Dr. Gray** is an Instructor of Medicine on the faculty of Primary Care, Internal Medicine, at the University of Maryland Hospital.

DR. SHERMAN

He has spent summers as a Physiology Instructor at the Johns Hopkins School of Medicine and a Research Assistant with the Baltimore City Health Department and the Johns Hopkins School of Hygiene and Public Health.

DR. GRAY

Lectureship Set Up

An endowed annual lectureship in biochemistry has been established at the University of Maryland School of Medicine by **Samuel Steinberg**, MD, Class of 1936, as a memorial to **H. Boyd Wylie**, MD, 1887-1963, who devoted his career to medical education at the University of Maryland, serving as Professor and Chairman of the Department of Biochemistry and as Dean of the School of Medicine.

Dr. Steinberg, a Philadelphia family physician, has established the Dr. Samuel Steinberg and H. Boyd Wylie Lecture so that distinguished individuals may be invited to lecture on the behalf of the Department of Biochemistry. The lectures will deal with future directions in the field.

Dr. Wylie, a native Baltimorean, graduated in 1912 from what was then the Baltimore Medical College, and spent the next 40 years at the School of Medicine, serving in various capacities. As a result of his efforts, a committee on

admissions for the selection of medical students was appointed. He contributed articles on biochemistry to medical journals, and **American Men of Science** noted his work on blood sugar findings in eclampsia and chemical methods for the diagnosis of pregnancy. His work earned him recognition in **Who's Who in America**, membership in Alpha Omega Alpha and a Wiley Day medical library tribute.

Dr. Steinberg, who worked his way through college and medical

school, credits Dr. Wylie with encouraging and persuading him to remain in medical school when financial difficulties threatened to cause him to withdraw.

Project Grants

The Southern Medical Association is pleased to announce SMA Research Project Fund recipients for the 1979-80 season, and Maryland's recipients are: **Mark P. Carol, MD**, University of Maryland School of Medicine, Neurosurgery, for "investigation of a new type of intraventricular catheter and monitoring system" and **Sheldon H. Lerman, MD**, University of Maryland School of Medicine, Surgery/Gastrointestinal, Physiology "splanchnic nervous control of the pyloric sphincter." □

Medical Miscellany

The Maryland Interdisciplinary Council for Children and Adolescents

The Maryland Interdisciplinary Council for Children and Adolescents, organized by concerned physicians in cooperation with other professionals, represents an important and extremely valuable sustained effort at interdisciplinary education and communication. The goal is the improvement of the manner in which professionals treat or represent their young patients or clients. Moreover, there is a sharing of concern and an endeavor to deal with such issues as the privacy of medical and psychiatric records required by and maintained by the public school system. There are monthly meetings and an annual conference. There are currently 14 professional groups comprising the Council. The professionals include lawyers, pediatricians, family practitioners, psychiatrists, social workers, educators, psychologists and mental health workers. Med-Chi was one of the founding organizations. Other medical groups assisting in organizing and maintaining the Council include the Maryland Academy of Pediatrics, the Maryland Psychiatric Society, the Regional Council of Child Psychiatry, the Maryland Society for Adolescent Psychiatry and the

Baltimore-District of Columbia Institute for Psychoanalysis.

The First Annual Interdisciplinary Conference on Children and Adolescents, held Jan. 27, 1979, was a resounding success. The Conference was over-subscribed and there were 225 professionals in attendance. The topic was **Public Law 94-142 (The Federal Law Regarding Free Education of Handicapped Children)—The Impact on Professionals Working in a Changing System**. A copy of the proceedings will be published, and available without charge, at the next Annual Meeting on Jan. 26, 1980.

The idea for formation of the Council arose in the Child and Adolescent Psychiatry Committee of the Maryland Psychiatric Society. The Council of the Maryland Psychiatric Society had been concerned that there were not enough opportunities for physicians to speak to and exchange ideas with lawyers and other professionals on a cooperative basis and enthusiastically supported the endeavor. The Chairperson has been Theodore H. Kaiser, MD and the Treasurer Louis Bandell, who is also the Treasurer for the Maryland Association for Mental Health, Inc.

The Second Annual Interdisciplinary Conference on Children and Adolescents will be held Jan. 26, 1980 at the Sheppard and Enoch Pratt Hospital. The subject will be the controversial new Juvenile Justice Standards of the Institute of Judicial Administration and the American Bar Association. These standards, if implemented, would replace treatment and rehabilitative efforts for juvenile offenders with determinate sentencing (similar to criminal sentencing). The title of the program is **Proposed Juvenile Justice Standards: Justice to the Offender or Abandonment of Our Youth?**

The Program is approved for 3.5 credit hours of Category I, AMA Continuing Education, and will be held from 9 AM-12:30 PM.

The Conference will discuss the controversial new Juvenile Justice Standards of the Institute of Judicial Administration and the American Bar Association. These broad

range proposals would markedly alter the manner in which we treat juvenile offenders. Among the starkly different consequences, determinate sentencing (similar to criminal sentencing) would replace treatment and rehabilitative efforts. These standards potentially would have an impact on all our youth and the professionals dealing with them. The Conference goal is to provide professional current information with which to understand and assess the new proposals.

The Conference will be addressed by Dr. Ivan W. Laurich, a Psychiatrist from the Medical Office of the Supreme Bench of Baltimore City, Dr. Ulku Ulgur, a practicing Child Psychiatrist; Judge Robert L. Karwacki, Administrative Judge of the Supreme Bench of Baltimore City; Donald H. Saidel, PhD, a psychologist of the Sheppard and Enoch Pratt Hospital and C. Marchal Fuller (MSW), Director of Clinical Services, of the Maryland Training School and Dr. Regina Cicci, language/learning specialist, University of Maryland Hospital.

The Conference is cosponsored by the Maryland Interdisciplinary Council for Children and Adolescents and the Maryland Psychiatric Society. The Council is the first sustained effort in Maryland to bring together a large interdisciplinary group of professionals for the purpose of increased communication and professional education dealing with children and adolescents. It is composed of representatives of the professional societies of 14 groups representing doctors, (including family practitioners, pediatricians and psychiatrists), lawyers, social workers, educators and psychologists through the state.

The registration fee for the Conference is \$7. Interns, residents, students and trainees will not be charged admission. For further information or registration, please contact Dr. Theodore H. Kaiser, Chairperson, MIC-CA, Box 23, Stevenson, MD 21153.

Maryland Academy of Family Physicians

MARYLAND ACADEMY OF FAMILY PHYSICIANS officers were present when Maryland's Gov. Harry Hughes signed a document proclaiming "Family Health Care Week" recently. From the left are Dr. John Umhau, (then) MAFP President-Elect; Gov. Hughes; Dr. Aris Allen; Dr. C. Earl Hill, (then) MAFP President and Dr. Dean Griffin, Program Chairman of the MAFP scientific assembly. (Photo courtesy of **AAFP Reporter**, Kansas City, MO.)

Maryland Hospital Association Speaking of Hospitals

RICHARD J. DAVIDSON, Editor

New Officials

A Baltimore attorney, a Black and Decker executive, a farmer from Southern Maryland and the president of a Baltimore County chemical firm took office recently as leaders of the Maryland Hospital Association.

The four serve as officers of the Board of Presidents, the governing body of the statewide association of Maryland's 62 community hospitals. They were elected at the organization's annual meeting. All came to their posts as volunteer trustees of their local hospitals.

Elected were Eugene M. Feinblatt of Baltimore, Chairman; Edwin G. Delcher of Timonium, Vice Chairman; B. B. Kemp of Welcome, Treasurer and George M. S. Riepe of Monkton, Secretary.

Feinblatt has been a Baltimore lawyer and civic leader for more than 30 years. He is First Vice President of Sinai Hospital and is the former President of both the Northwest Baltimore Corporation

and the Baltimore Jewish Council. Other civic leadership posts include the boards of the National Housing Conference, the National Community Relations Council and the Baltimore Chapter of the American Red Cross. He has been a trustee at Sinai for the past seven years.

He also has served as Chairman of the Baltimore Urban Renewal and Housing Agency and the Baltimore Regional Planning Council's Area Housing Council. Feinblatt, who earned his bachelor's and law degrees at the University of Virginia and did postgraduate work at Harvard, has taught at both the University of Maryland School of Law and Johns Hopkins University. He was a Professor in that institution's Department of Public Health Administration for three years.

The Senior Vice President and Secretary of Black and Decker, Edwin Delcher has served as a Trustee of Saint Joseph Hospital in Towson for the past four years. He

is on the Board of the Union Trust Company and is a member of the Maryland Association of Certified Public Accountants and the Financial Executives Institute.

MHA's new treasurer, B. B. Kemp, has been a leader in Southern Maryland's agricultural and civic communities for nearly 40 years. A resident of Charles County, he has served on the Board of Trustees of Physicians Memorial Hospital in La Plata for 16 years, presiding as its Chairman for 12 yrs. He was one of the founders of the Southern Maryland Hospital Association and was its first President. Kemp served a two-year term on the Southern Maryland Health Systems Agency Board and has been a Director of the Charles County Farm Bureau for more than 30 years.

George M. S. Riepe is in his second term as MHA Secretary. He is completing 12 years on the Board of Church Hospital in Baltimore. Riepe has been President of the Board of Trustees since 1973 and Chairman of the hospital's Board of Directors since 1974.

The President of the Warner-Graham Company, he earned both the Bronze Star and Purple Heart in World War II and was an All-American lacrosse player during his collegiate days at Johns Hopkins University. His civic activities include work with the United Way, the Heart Association, the Family and Children's Society and the Jaycees. □

Information for Authors

MED-CHI MEMBERS reading papers before Faculty or other organizations are invited to submit their papers to the **JOURNAL** for consideration by the Editorial Board for publication.

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the *Journal*. An abstract or summary, limited to 200 words, should be included.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the *Journal* and are not returned. The *Journal* is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to Editor, *Maryland State Medical Journal*, 1211 Cathedral St, Baltimore MD 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (including text, case reports, legends, tables and references) with margins of at least one inch. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations and any institutional or other credits. Please include a complete address where the author may receive proofs for approval and corrections.

The author should retain a copy of the article for his/her records, copy for his/her records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title and its position in the text should be indicated. The

Editor reserves the right to edit the tables. Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text. A complete review of the literature is rarely desirable. References must be typed doublespaced and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article and date. Complete dates (month, day and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher year, volume (if given) and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any. References should be listed consecutively, both in text and listing.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black and white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Please do not deface an illustration by writing on the front or back UNLESS it is done lightly with a grease pencil or so lightly that the imprint will not register through to the front. The figure number and author's name will suffice.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings. The Editor reserves the right to limit the number of photographs used.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with *Journal* style.

A set of galley proofs will be provided the principal author and if not returned by the specified date will be considered approved as type set.

Statements made or opinions expressed by any contributor in any article or feature published in the *Journal* are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the *Journal* is protected by copyright and may not be reproduced without the written permission of both the author and the *Journal*. □

SYMPOSIUM ON GYNECOLOGIC ONCOLOGY DECEMBER 7 & 8, 1979

THE INTERNATIONAL HOTEL
Baltimore, Maryland

Sponsored by the
Gynecology Oncology Program
Department of Obstetrics and Gynecology
and the
Department of Radiotherapy
and the
Program of Continuing Education
University of Maryland - School of Medicine

This symposium on gynecologic oncology is designed to help
gynecologists, radiation therapists, oncologists and primary
care physicians become aware of some of the new develop-
ments in the diagnosis and treatment of pre-malignant and
malignant lesions of the female genital system.

For further information contact:
The Program of Continuing Education
University of Maryland - School of Medicine
10 South Pine Street, Baltimore, MD 21201

For recurrent attacks of urinary tract infection in women

Bactrim™ DS Double Strength Tablets

Each tablet contains 160 mg trimethoprim and 800 mg sulfamethoxazole.

Just one tablet b.i.d. for 10 to 14 days

- Action at urinary/vaginal/lower bowel sites helps eliminate reservoirs of infecting organisms
- Distinctive antibacterial action plus wide spectrum helps eradicate recurrent UTI
- Low incidence of bacterial resistance in community practice

- Convenient *b.i.d.* dosage provides day-and-night antibacterial control
- Contraindicated during pregnancy and the nursing period. During therapy, maintain adequate fluid intake; perform CBC's and urinalyses with microscopic examination.

Before prescribing, please consult complete product information, a summary of which follows:

Indications and Usage: For the treatment of urinary tract infections due to susceptible strains of the following organisms: *Escherichia coli*, *Klebsiella-Enterobacter*, *Proteus mirabilis*, *Proteus vulgaris*, *Proteus morgani*. **It is recommended that initial episodes of uncomplicated urinary tract infections be treated with a single effective antibacterial agent rather than the combination.** Note: The increasing frequency of resistant organisms limits the usefulness of all antibacterials, especially in these urinary tract infections.

Also for the treatment of documented *Pneumocystis carinii* pneumonitis. To date, this drug has been tested only in patients 9 months to 16 years of age who were immunosuppressed by cancer therapy.

The recommended quantitative disc susceptibility method (*Federal Register*, 37:20527-20529, 1972) may be used to estimate bacterial susceptibility to Bactrim. A laboratory report of "Susceptible to trimethoprim-sulfamethoxazole" indicates an infection likely to respond to Bactrim therapy. If infection is confined to the urine, "Intermediate susceptibility" also indicates a likely response. "Resistant" indicates that response is unlikely.

Contraindications: Hypersensitivity to trimethoprim or sulfonamides; pregnancy; nursing mothers; infants less than two months of age.

Warnings: Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been associated with sulfonamides. Experience with trimethoprim is much more limited but occasional interference with hematopoiesis has been reported as well as an increased incidence of thrombopenia with purpura in elderly patients on certain diuretics, primarily thiazides. Sore throat, fever, pallor, purpura or jaundice may be early signs of serious blood disorders. Frequent CBC's are recommended; therapy should be discontinued if a significantly reduced count of any formed blood element is noted.

Precautions: Use cautiously in patients with impaired renal or hepatic function, possible folate deficiency, severe allergy or bronchial asthma. In patients with glucose-6-phosphate dehydrogenase deficiency, hemolysis, frequently dose-related, may occur. During therapy, maintain adequate fluid intake and perform frequent urinalyses, with careful microscopic examination, and renal function tests, particularly where there is impaired renal function.

Adverse Reactions: All major reactions to sulfonamides and trimethoprim are included, even if not reported with Bactrim. **Blood dyscrasias:** Agranulocytosis, aplastic anemia, megaloblastic anemia, thrombopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia. **Allergic reactions:** Erythema multiforme, Stevens-Johnson syndrome, generalized skin eruptions, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis. **Gastrointestinal reactions:** Glossitis, stomatitis, nausea, emesis, abdominal pains, hepatitis, diarrhea and pancreatitis. **CNS reactions:** Headache,

peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo, insomnia, apathy, fatigue, muscle weakness and nervousness. **Miscellaneous reactions:** Drug fever, chills, toxic nephrosis with oliguria and anuria, periarteritis nodosa and L. E. phenomenon. Due to certain chemical similarities to some goitrogens, diuretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused rare instances of goiter production, diuresis and hypoglycemia in patients; cross-sensitivity with these agents may exist. In rats, long-term therapy with sulfonamides has produced thyroid malignancies.

Dosage: Not recommended for infants less than two months of age.

Urinary Tract Infections: Usual adult dosage—1 DS tablet (double strength), 2 tablets (single strength) or 4 teasp. (20 ml) b.i.d. for 10-14 days.

Recommended dosage for children—8 mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses for 10 days. A guide follows:

Children two months of age or older:

Weight		Dose—every 12 hours	
lbs	kgs	Teaspoonfuls	Tablets
20	9	1 teasp. (5 ml)	½ tablet
40	18	2 teasp. (10 ml)	1 tablet
60	27	3 teasp. (15 ml)	1½ tablets
80	36	4 teasp. (20 ml)	2 tablets or 1 DS tablet

For patients with renal impairment:

Creatinine Clearance (ml/min)	Recommended Dosage Regimen
Above 30	Usual standard regimen
15-30	½ the usual regimen
Below 15	Use not recommended

***Pneumocystis carinii* pneumonitis:** Recommended dosage: 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

Supplied: Double Strength (DS) tablets, each containing 160 mg trimethoprim and 800 mg sulfamethoxazole, bottles of 100; Tel-E-Dose® packages of 100. Tablets, each containing 80 mg trimethoprim and 400 mg sulfamethoxazole—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 40, available singly and in trays of 10. Oral suspension, containing in each teaspoonful (5 ml) the equivalent of 40 mg trimethoprim and 200 mg sulfamethoxazole, fruit-licorice flavored—bottles of 16 oz (1 pint).

Roche Laboratories
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

Please see back cover.

Her next attack of cystitis may require

the BactrimTM

3-system counterattack

Bactrim has shown high clinical effectiveness in recurrent cystitis as a result of its wide spectrum and distinctive antimicrobial action in the urinary, vaginal and lower intestinal tracts.

The probability of recurrent urinary tract infection appears to be enhanced by the establishment of large numbers of *E. coli* or other urinary pathogens on the vaginal introitus. The trimethoprim component of

Bactrim diffuses into vaginal fluid in effective concentrations, thus combating migration of pathogens into the urethra.

• Studies have shown that Bactrim acts against *Enterobacteriaceae* in the bowel without the emergence of resistant organisms. Thus, Bactrim reduces the risk of introital colonization by fecal uropathogens. It has *no* significant effect on other normal, necessary intestinal flora.

Bactrim fights uropathogens in the urinary tract/vaginal tract/lower intestinal tract

Please see reverse side for summary of product information,

CHECK IN SERVICE
15 SOUTHWEST PARK
WESTWOOD MA 02090

"Nelson... said to his Captain, 'You know, Foley, I have only one eye. I have a right to be blind sometimes.' He is said to have raised his spyglass to his right eye, the one injured... and announced that he could not see the signal to leave off action..."

in History:

ADMIRAL SIR
HORATIO NELSON

Many physicians are seeking relief from the ever increasing pressures of private practice. If you are a physician, and less than 56 years of age, the United States Air Force Medical Service offers you an alternative and a unique challenge.

The Air Force physician participates in a group practice environment with the entire spectrum of medical specialties available. Air Force hospitals are accredited and are fully equipped. Health care is provided to every patient without regard for his ability to pay.

Benefits provide a secure and satisfying lifestyle, including 30 days of annual

paid vacation, professional pay and recreational opportunities.

Consider the Air Force as an alternative to your present practice. Positions are available in primary health care delivery, and a few major medical specialties.

Starting salaries and rank are commensurate with education and experience. Assignment to a specific Air Force Hospital within the United States or overseas may be arranged.

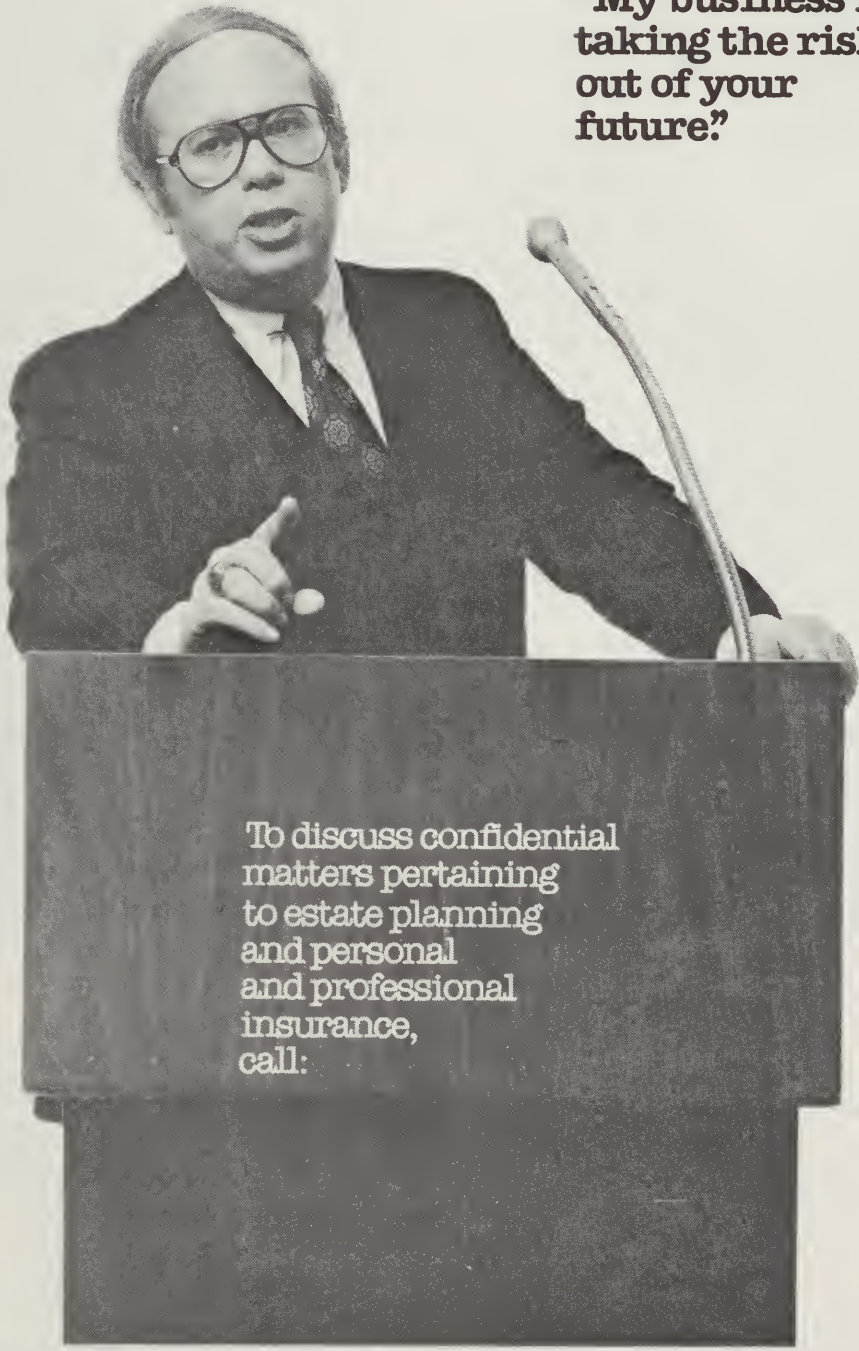

Consider Air Force Medicine. Excellent pay and benefits, professional challenge and educational opportunities make the Air Force Medical Service a viable alternative to private practice.

A character all its own.

Valium (diazepam/Roche)
is a benzodiazepine with a
character all its own.

Pharmacologically, it is a potent skeletal muscle relaxant and anticonvulsant (in adjunctive use), as well as an antianxiety agent. Pharmacokinetically, only Valium provides active *diazepam* as well as the active metabolites 3-hydroxydiazepam, desmethyldiazepam and oxazepam.

But the individual character of Valium is even more apparent clinically than pharmacokinetically. And far more significant. That's because of the patient response obtained with Valium. A response which brings a calmer frame of mind. A response which has a pronounced effect on the somatic symptoms of anxiety, particularly muscular tension. A response which helps the patient feel more like himself again because of the way Valium reduces the overwhelming symptoms of anxiety and psychic tension.

Another important aspect of the clinical character of Valium is safety. Though drowsiness, ataxia and fatigue are possible, these and more serious side effects are rarely a problem. Of course, as with all CNS-acting drugs, patients taking Valium should be cautioned against driving, operating dangerous machinery or the simultaneous ingestion of alcohol.

Unquestionably, many psychotherapeutic agents, including other benzodiazepines, have antianxiety effects. But one fact remains: you get a certain kind of patient response with Valium. It's a response you want. A response you know. A response you trust as part of your overall management of anxiety and psychic tension.

Valium®^{IV}
diazepam/Roche
2-mg, 5-mg, 10-mg scored tablets
a prudent choice in psychic
tension and anxiety

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology; spasticity caused by upper motor neuron disorders; athetosis; stiff-man syndrome; convulsive disorders (not for sole therapy).

The effectiveness of Valium (diazepam/Roche) in long-term use, that is, more than 4 months, has not been assessed by systematic clinical studies. The physician should periodically reassess the usefulness of the drug for the individual patient.

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in trays of 4 reverse-numbered boxes of 25, and in boxes containing 10 strips of 10; Prescription Paks of 50, available singly and in trays of 10.

Roche Laboratories
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

Only Jobst supports are custom made from precise measurements of the individual extremity.

Jobst® Venous Pressure Gradient® Supports

These measured, custom-made therapeutic elastic supports have carried the Jobst name to the four corners of the world. Prescription only, the supports can be engineered with counterpressures of 25, 30, 40 or 50 mm.Hg at the ankle, decreasing proximally along the venous pressure gradient. They are available in knee-length, full-leg, waist-height and lymphedema sleeve styles. The waist-height Jobst Pregnancy Leotard deserves special mention because each one is custom made with an expandable panel according to the patient's own measurements.

Contact your local Jobst Service Center for complete details.

AN EXTENSION OF HOPE FOR THE ALCOHOLIC

HIDDEN BROOK BEL AIR

Established 1968

We are pleased to announce the opening of Hidden Brook at Warwick. This is a major new enlargement of our capacity for the treatment of alcoholics...an expansion of 20 additional beds to the 39 already at Bel Air. Beautifully situated on the waterfront of the Warwick River near Secretary, Maryland in Dorchester County...the total environment is peaceful and ideally conducive to rehabilitation. The program, philosophy and rates of Hidden Brook at Warwick will be identical and interchangeable in every respect with the program at Hidden Brook, Bel Air. Request our brochure. Write or phone for information.

Don't just tell her to quit...

Studies confirm that 9 out of 10 smokers know that smoking is a bad habit. And they'd like to quit. But they don't know how.

The large majority of smokers indicate they would quit if their doctors told them to.

And studies confirm that a large proportion of patients have quit upon advice from their doctors.

However, about two-thirds of smokers report that they've never received advice on quitting from their doctors. It could be their doctors don't want to push them. Or maybe quitting is given a lower priority than other health problem.

But we believe a lot of doctors don't tell their patients to quit smoking for one simple reason: they don't know how to answer the inevitable "how."

The National Cancer Institute has developed a free "Helping Smokers Quit" kit to help you answer the "how" and to help your patients quit the smoking habit. Materials for this kit were pretested with the cooperation of the Harris County (Texas) Medical Society and M.D. Anderson Hospital and Tumor Institute in Houston, Texas.

The National Cancer Institute will provide the "Helping Smokers Quit" kit free of charge to all physicians who want to participate in this important effort. Included in the kit are guidelines for physicians, a self-test to help smoking patients determine why they smoke, pamphlets with tips on quitting, and waiting room posters to introduce the subject. Each kit contains enough materials to help 50 of your smoking patients who want to quit.

Show her how to quit.

Cigarette smoking remains the single greatest preventable cause of death and disability in the US today. In 1977, smoking was a major factor in an estimated 220,000 deaths from heart disease; 78,000 lung cancer deaths, and 22,000 deaths from other cancers, including cancers of the mouth, esophagus, pancreas, kidney and bladder; 40% of all cancers in males, and a rapidly-increasing percentage in females, are caused by smoking. Eighty-five percent of deaths from bronchitis, emphysema and other lung diseases could be prevented if people stopped smoking.

Fortunately, a recent study has shown that nine out of 10 smokers **want** to quit. The larger majority indicate they would quit if their physicians **told** them to, and studies confirm that many smokers **have** quit upon advice from their physicians; however, about two-thirds of smokers report that they have never received advice on quitting from their physicians.

To help physicians encourage quitting by their patients, the National Cancer institute has developed the **Helping Smokers Quit** kit. The kit contains enough materials to assist 50 smokers who want to quit.

The kit can make a major contribution to your efforts to prevent cancer and other chronic diseases among your patients. The kit is being provided free of charge to all physicians who want to participate in this important preventive health effort.

DIAMONDS FOR INVESTMENT

- Is it a good idea?
- Should you get involved?
- How do you invest?
- What are the pitfalls?

The recent increasing awareness of diamonds as a possible investment has developed many questions in the minds of potential investors. Our diamond investment consultant and graduate gemologist, Robert L. Smyth, Jr. has the answers to many of these questions and the experience of working with numerous individuals who have pursued diamonds as an investment. If you are interested in learning more, he can be contacted at 252-6666, Monday through Saturday (except Wednesday).

The Open Forum

Dr. Morris

To the Editor:

The article on **The History of Obstetrics and Gynecology in Maryland, 1770-1976**, published in the September, 1979 edition of the **Journal**, omitted Dr. Frank K. Morris' name.

Dr. Morris was a noble gentleman, a fine physician and an outstanding practitioner of gynecology and obstetrics.

In the article, his name was forgotten. Those who knew him still feel and pay tribute to the homage he deserves for his useful and generous life.

On Sen. Mathias' Comments

To the Editor:

The comments by Senator Charles McC. Mathias, Jr., (R., MD) under Medical Miscellany (September, 1979—ed. note), have accurately defined one of the major causes for not having enough "primary physicians" in Maryland. Perhaps if he would pursue this issue of inequitable reimbursement to family physicians by third-party payors, the people of Maryland would have a lower cost medical system.

I hope others will join Sen. Mathias in his endeavors to accomplish the above task.

Six, Not Two

To the Editor:

Prince George's County has six civilian hospitals, each of which has an Emergency Room. It is quite distressing to us in Prince George's County to see a list of Maryland hospitals which omits four of our hospitals, particularly in a publication such as the **Journal**.

To set the record straight, following is a list of the civilian hospitals in Prince George's County:

Clinton Community Hospital
8910 Woodyard Rd.
Clinton, MD 20735
(301) 868-1500.

Doctors' Hospital of Prince George's County
8118 Good Luck Rd.
Lanham, MD 20801
(301) 552-9400.

Eugene Leland Memorial Hospital
4408 Queensbury Rd.
Riverdale, MD 20840
(301) 864-1200.

Greater Laurel/Beltsville Hospital
7100 Contee Rd.
Laurel, MD 20810
(301) 953-1300.

Prince George's General Hospital and Medical Center
Cheverly, MD 20785
(301) 341-3300.

Southern Maryland Hospital Center
7503 Surratts Rd.
Clinton, MD 20735.

SUSAN B. WATERS
Executive Director
Prince George's County Medical Society
7901 Annapolis Rd., Suite 203
Lanham, MD 20801.

(Managing Editor's Note: The list in question appeared on pp. 80-81 in the **Special Section on Heart Attack** of the September, 1979 issue, and was supplied to the **Journal** by the American Heart Association—Central Maryland Chapter. As a result of Ms. Waters' letter, the list is under revision by the AHA/CMC.—BT.) □

From Dr. Morrison . . .

To the Editor:

Please consider this an open letter by means of which I wish to convey certain information to your readership.

I should be pleased to see an article under my name in the September, 1979 issue of the **Journal (Medical Annals of Maryland, 1899-1925/Nutrition in Maryland 1899-1928—ed. note)**, but, to be frank, I am not altogether enthusiastic about it for reasons which I would like to make clear.

First, this article was brought together so many years ago that I had forgotten about it and, therefore, I would not like anyone to think it was recently written. Furthermore, I was not given the opportunity to read the proof which would have given me a chance to modify the article, although the essential facts are present as it is printed; however, there are certain errors which I know you will appreciate my calling to your attention. First, the major title is **Medical Annals of Maryland, 1899-1925**. The article under my name is **Nutrition in Maryland, 1899-1928**. Only one reference includes the date 1928. This, perhaps, is not important, but the very first sentence which reads, "Great names appear in the 19th Century as well as in the modern history of nutrition until E.V. McCollum came to Baltimore, the contributions of Marylanders to the field of nutrition were sporadic and only a temporary importance." This sentence is incorrect. At best, it should read, "Great names appear in the 19th Century, as well as in the modern history of nutrition. Until E.V. McCollum came to Baltimore, the contributions of Marylanders to the field of nutrition were sporadic and only of temporary importance." In other words, breaking this down into two sentences makes sense, whereas in one sentence it does not sound grammatically correct. Also, my birthdate is wrong and my professorial status is not correct, and then, without going into too much detail, there are errors in sentence structure and punctuation, which I know would have been corrected if I had been given the opportunity to read the proof. As one more example of what prompts me to write this letter, which I would rather not have been called upon to do, is the last paragraph on page 108 where there seems to have been the omission of a sentence or two.

On a brighter side, and in trying to recall those early years when I was asked to join a group to write the **Medical Annals of Maryland**, I also remember the enthusiasm with which we undertook a task which proved to be quite difficult. As mentioned above, the article, as is, conveys some very notable historical facts, and to that end, serves an important purpose and I should, I suppose, commend the **Journal** for deciding to publish it, except that, in my judgment, what is good could have been better if I had an opportunity to read a proof and to have made some additional comments to bridge a gap between then and now.

Finally, the fundamentals are there, but not the cohesiveness I would like.

Written in good faith, I am

SAMUEL MORRISON, MD

11 E. Chase St.,
Balto., MD 21202.

Home-Style Nursing, by Mary Kate House

Here's how to set up your own retirement plan and earn **8%** interest

Individual Retirement Accounts at The Savings Bank allow you to set aside as much as 15% of your annual income up to \$1500 a year and deduct it from your taxable income.

NO TAXES WILL BE REQUIRED ON THIS AMOUNT UNTIL YOU RETIRE —and by then you'll probably be in a lower tax bracket. See how much \$1500 a year can add up to in a Savings Bank I.R.A. Account,* the pension plan for professionals.

Years	Total I.R.A. Deposits	Total Interest Earned	Savings For Retirement
10	\$15,000	\$ 8,909.02	\$ 23,909.02
20	\$30,000	\$ 47,114.85	\$ 77,114.85
30	\$45,000	\$150,516.22	\$195,516.22

For more information or to open your own Individual Retirement Account, contact any office of The Savings Bank today.

Main Office: Charles and Baltimore Sts.
and 20 other convenient locations.

*Based on contributions of \$1500 the first of each year earning 8% interest annually and assuming the rate remains constant.

Consider the advantages of **COMPLETE MEDICAL EQUIPMENT LEASING**

More and more professional men and women are discovering that leasing equipment from Savers Leasing Corp. can be a lot more practical than buying. Here's why:

- A plan tailored to your professional needs
- No initial capital outlay
- Extended terms available
- Complete turnkey leasing
- The ability to acquire the latest in medical equipment

Call 539-0108 for all the details. It might be the most important move you make all day.

SCIENTIFIC EXHIBIT APPLICATION

Scientific exhibits are an integral part of the Annual Meeting. All physicians, medical institutions, and organizations having an appropriate exhibit are urged to complete the application below for consideration by the Exhibit Subcommittee.

PLEASE INDICATE THE CATEGORY OF EXHIBIT:

- ☐ **SCIENTIFIC EXHIBIT:** Result of original scientific research which involved the personal contribution of the exhibitor. Its purpose is to advance medical knowledge. It should not be designed for the personal, financial gain of the exhibitor.
EXHIBIT FEE: Waived. Each Space 8' x 10'.
- ☐ **CLINICAL DISPLAY EXHIBIT:** Must be of a scientific nature, but not necessarily original research. The exhibitor need not be personally involved in the research. The exhibit should contribute to the advancement of knowledge of other members of the profession, but it may also contribute to the personal, financial gain of the exhibitor.
EXHIBIT FEE: \$150 for each 8' by 10' space.
- ☐ **EDUCATIONAL:** Any exhibit of a scientific and non-commercial nature which does not fit into either of the above two categories. Included would be voluntary health organizations and local and State agencies.
EXHIBIT FEE: \$60 for each 8' by 10' space.

PLEASE COMPLETE AND SUBMIT BY JAN. 31, 1980

RULES GOVERNING SCIENTIFIC EXHIBITS

1. U-Neek Display is the official decorator for the 1980 meeting, and, upon request, will transport, set up and dismantle an exhibit.
2. If the exhibitor elects to transport, and/or set up and dismantle his/her own exhibit, he/she is then fully responsible for his/her own exhibit.
3. The exhibitor is fully responsible for the content, arrangement and presentation of exhibit.
4. The Medical and Chirurgical Faculty will provide an 8' x 10' booth, backdrop and siderails, one covered table and two chairs.
5. ALL ELECTRICAL OUTLETS will be billed directly to exhibitor from the Convention Center and should be ordered through U-Neek Display.
6. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS.
7. No reference to, or credit for, financial aid shall be shown on exhibit.
8. Only generic names may be used. No trade names are permissible.
9. Each exhibit should be manned at all times by someone familiar with its content.
10. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.
11. Inquiries should be directed to:
Ms. Mary E. Galeckas at Med-Chi, (301) 539-0872.

**182ND ANNUAL MEETING
MEDICAL AND CHIRURGICAL FACULTY
OF THE STATE OF MARYLAND**

NEW DATES: WEDNESDAY, THURSDAY, FRIDAY,
APR. 23 - 25, 1980

NEW LOCATION: BALTIMORE
CONVENTION CENTER

THEME: UPGRADING YOUR PRACTICE

Among the groups cosponsoring sessions at the Annual Meeting are:

Committee on Alcoholism
Maryland-DC Society of Rehabilitation Medicine
Maryland Orthopedic Society
John Staige Davis Society of Plastic Surgeons of Maryland
Maryland Radiological Society
Maryland Society of Allergy
Maryland Ophthalmological Society/Maryland Academy of Ophthalmology
Maryland Dermatological Society
Public Relations Committee
Committee on Physician Rehabilitation
Occupational Health Committee
Maryland Psychiatric Society
Maryland Society of Gastrointestinal Endoscopy
Maryland Society of Cardiology
American Heart Association, Central Maryland Chapter, Stroke Subcommittee
Maryland-DC Society of Anesthesiology
Maryland Urological Society

•

The above program is subject to change. Watch for further details in upcoming issues of the **Journal**.

Report of Maryland Delegates to the AMA House of Delegates, July 22-26, 1979, Chicago, IL

The Maryland delegation to the AMA Annual House of Delegates Meeting, consisting of the Faculty's two Delegates, three Alternate Delegates, the President and President-Elect, as well as staff, attended the annual session in Chicago from July 22-26, 1979.

The AMA House considered 262 resolutions and reports. Stephen K. Padussis, MD, served on Reference Committee F, and each of the other attendees was assigned to a specific Reference Committee to hear the general discussion that takes place on each resolution or report.

As is customary during this session, the delegation caucussed with the Southeastern Coalition States to interview candidates for various offices in the AMA. In addition, the delegation also caucussed by itself to consider the various items before the House.

It would be impossible to provide a complete run-down on each issue discussed by the Committees and the reports made to the House itself. The more important issues to come before it and the action taken is as follows:

Liaison Committee on Continuing Medical Education—The AMA House approved a recommendation of the Council on Medical Education which recommended the withdrawal of AMA from LCCME and the prompt resumption of AMA's previous responsibility for the voluntary accreditation of CME through the establishment of a Committee on Accreditation of CME of the AMA. This will probably entail the disbanding of the LCCME, whose staff and facilities were provided by AMA. AMA has resumed the responsibility for accreditation of CME which it held prior to 1977. Institutions already accredited for CME will continue to be recognized as such by AMA.

Changes in the Principles of Medical Ethics—The House approved a progress report of the Ad Hoc Committee on the Principles of Medical Ethics and avoided a possible confrontation with the Federal Trade Commission. The FTC has said that no changes in the Principles can be made unless previously approved by the FTC. Further action on any changes in the Principles will be considered by the House of Delegates in December, 1979. The Principles were first adopted in 1847 and have been revised only twice since.

Chiropractic—The House abandoned its blanket condemnation of chiropractic as an "unscientific cult," but said "The AMA knows of no scientific evidence to support manipulation and adjustment as appropriate treatment for human ailments such as essential hypertension, heart disease, stroke, cancer, diabetes and infections." Under the new policy, the AMA would continue to warn the public of the hazards of relying on spinal manipulation to treat such conditions. While the AMA's 1966 policy on chiropractic warned that voluntary association with cultists is unethical, the new policy statement asserts that a physician may refer a patient to a "Licensed limited practitioner whenever he believes that this will benefit the patient."

National Health Insurance—The controversy over NHI which has persisted for over 30 years continues. The House reaffirmed an action taken by the House last December that AMA would introduce a health insurance bill into Congress "only if necessary" and if introduced, to include the following four principles:

1. "Requiring minimum standards of adequate benefits in all health insurance policies sold in the United States with appropriate deductible and co-insurance.

2. "A simple system of uniform benefits provided by the Federal, State and local governments for those individuals who are unfortunate enough (through no fault of their own, i.e., age, disability, financial hardship, etc.) not to be able to provide for their own medical care.

3. "A nationwide program by the private insurance industry of America (and government, if necessary, for reinsurance) to make available catastrophic insurance coverage for those illnesses and individuals where the economic impact of a catastrophic illness could be tragic. All catastrophic coverage should have an appropriate deductible and coinsurance to make it economically feasible and to avoid abuse.

4. "A program developed pursuant to those principles should be administered at the State level with national standardization through Federal guidelines."

Other House Actions—The House endorsed the concept that AMA should strive to become the umbrella organization for all physician organizations. At the same time, it called on AMA's Long-Range Planning and Development Council and the state medical societies to study the concept of changing AMA from an association of individual members to an organization of American medical organizations. In addition, the House authorized the Board to conduct pilot studies in the area of recruiting AMA members directly who may or may not be members of county and state medical societies.

In the areas of Health Planning and HMOs, various actions were taken. In connection with planning, the AMA was urged, "... To work for an increased role in health planning for the medical society and physicians at the local level, and a diminished role for Federal legislative and bureaucratic bodies."

The AMA House adopted a motion that, "... condemn(s) the Department of Health, Education and Welfare for the use of public funds to promote enrollment of Medicare beneficiaries in HMOs over other forms of health care delivery."

Other individual actions taken by the House covered a variety of subjects.

These included:

Physician Extender Programs: Report F of Council on Medical Service **Adopted** with the following clarification, and the Council on Medical Service requested to continue to study and reevaluate its position on physician extender programs:

It shall be AMA policy that the personal presence or participation by the supervising physician in the physician extenders activities where the services are rendered should be the standard of care in the usual practice settings. In unusual practice settings, exceptions to this standard of care should be determined and a specific waiver to this standard may be granted by the state medical board on an individual case-by-case basis.

Payments by insurance carriers for reconstructive surgery of the breast: Resolved, That the AMA adopt the policy that reconstruction of the breast for rehabilitation of the post-mastectomy cancer patient should be considered reconstructive surgery rather than esthetic surgery.

Physician's Role in returning patients to their jobs: Resolved, That the AMA encourage physicians everywhere to advise their patients to return to work at the earliest date compatible with health and safety.

Opposition to reduction in Medicare fees to private and non-salaried physicians whose patients are in teaching hospitals: Report I of the Board of Trustees informed the House of Delegates of AMA efforts opposing reductions in Medicare payments to private and non-salaried physicians whose patients are in teaching hospitals, and recommended adoption of the report in lieu of Resolution 76 (I-78).

Energy policy of the Federal Government with respect to Physicians: Report SS of the Board of Trustees informed the House of the Association's activities regarding proposed gasoline regulation, indicated that the Association will continue to monitor the situation and to work with government and private agencies in this matter, and recommended that the report be adopted in lieu of Resolution 7 (I-78).

Continuing Medical Education:

Resolved, That the AMA deplores excessive charges for CME programs which exploit physicians or distort the real purposes of education programs, and be it further

Resolved, That the AMA encourages state society accrediting agencies to consider the impact of the cost of the accreditation process on program charges, and be it further

Resolved, That the AMA make a concentrated effort to acquaint physicians with programs that will help them meet their particular educational needs at a reasonable cost.

Resolved, That the AMA study the current status of CME in the US, the effectiveness of mandatory CME legislation in assuring professional competence, and comparative charges by organizations conducting CME programs and report to the House of Delegates at the 1980 Annual Meeting.

Medical School Curriculum:

Resolved, That the AMA adopt and help implement the principle that all American medical schools include in the curriculum appropriate instruction in medical economics, designed as preparation for the practice of health care delivery including cost containment, and an understanding of the functions of organized medicine in safeguarding the interests of patients and discharging the obligations of the medical profession and be it further

Resolved, That the AMA adopt and help expedite

the principle that appropriate instruction in medical economics be included in graduate training and continuing medical education programs.

State Medical Licensure Laws:

Resolved, That the AMA is opposed to medical licensing laws that define medical specialty practice and limit a physician's practice by specialty, and that this action be communicated to state medical societies.

Physician well-being:

Resolution 168 asked that the AMA develop and implement a plan to utilize its resources to prevent impairment and promote physician well-being throughout the continuum of medical education and to report to the House at the 1979 Interim Meeting and periodically thereafter as appropriate.

Resolution 168 ADOPTED

FTC Interference:

Resolved, That the AMA seek legislation which would permit constituent medical societies of the AMA to review the reasonableness of physicians' charges to protect the public, and be it further

Resolved, That the AMA seek legislation if necessary to protect the role of the constituent and component medical societies in the discipline of members who charge excessive fees or exploit their patients.

Complete details on any subject may be obtained through the Faculty Office, including copies of any reports considered by the House.

Executive Director's Newsletter

December, 1979

NEWS Russell S. Fisher, MD, Baltimore, has been named "Pathologist of the Year" by the College of American Pathologists. OF Recently designated Fellows of the American College of Surgeons are Drs. Juan M. Pardo, Arnold; Douglas A. Finnegan, Annapolis; NOTE and Myron I. Murdock, Bowie. Tillman D. Johnson, MD, of Elkton, was honored at a recent dinner occasioning his retirement to Punta Gorda, Fla. Many dignitaries attended the event where he was presented with a certificate of recognition from Governor Harry R. Hughes.

GOLF, The Pennsylvania Medical Society is sponsoring three Scientific/Vacation programs in the near future. Skiing and TENNIS, Scientific programs are combined for a week at Snowmass, Colorado, February 17-24; Golf/Tennis are planned for a week SKIING, February 25-March 5 at Orlando, Florida; and strictly a vacation program is set for March 19-26 in Kauai, Hawaii. ANYONE? Details can be obtained from Ms. Mary Galeckas at the Faculty office.

"BOAT PEOPLE" Concern has been expressed over the plight of the "boat people" REFUGEES refugees by the AMA House of Delegates, and the AMA Board has been instructed to develop a program to respond to the medical emergencies of these people.

Physicians who may wish to volunteer their services for this cause should contact the Office of International Medicine at AMA Headquarters in Chicago. Only limited numbers of volunteer physicians are being placed for short-term stays of three months.

In addition, the Center for Disease Control has requested assistance from volunteers to provide immediate relief to Indochinese refugees who may be ill when they arrive at ports of entry—Washington, DC is one port of entry. Physician volunteers might be called upon once every three or four months.

Contact the Faculty office if you are interested in volunteering in this latter category.

NEW In response to increasing inquiries regarding ownership, BOOKLET availability, and rights to review patient medical records, the Faculty has prepared a booklet outlining current legal and ethical requirements in this regard.

Copies may be obtained by contacting the Faculty office, 301-539-0872.

ENERGY

While it is not anticipated that gasoline supplies will be in short supply in the near future, the Faculty still has in effect its arrangement with the Energy Office for special allocation of gasoline for use by physicians.

NEEDS

Storage facilities and adequate control, so that it is used by physicians only and for medical services, must be worked out by component medical societies.

Should shortages develop, this system can be implemented promptly to alleviate such problems. Some medical societies have been obtaining release of supplies from the emergency allotment for this purpose each month, even though a shortage does not exist at this time.

MEMBERSHIP

We are again preparing to randomly survey 20% of our membership to determine your feelings on our work and the benefits offered to you, the members. We cannot urge you strongly enough to complete and return the survey questionnaire, so we can be more responsive to your needs.

SURVEY

RESOLUTIONS

Deadline date for receipt of resolutions for consideration at the 1980 annual House of Delegates session is

DEADLINE

FRIDAY, FEBRUARY 29, 1980.

Receipt in the Faculty office must be by close of business on that date.

All resolutions must be sponsored by a member or component society of the Faculty, the Council or committees of the Faculty, provided, however, that a resolution introduced by an individual member must have the endorsement of either one-third of the membership of his component society or 30 members of his component society, whichever is smaller.

HOT LINE FOR IMPAIRED PHYSICIANS - 301-467-4224

Money isn't everything.

It's knowing what to do with it that really counts.

Where to invest it. How to make it grow. Get income from it. Minimize risk and taxes.

That's why it pays to have people around you who make it their business to know. Who are investment management experts.

Like the people in the Trust Division at Union Trust Bank.

For the past ten years, our professional managers have consistently outperformed other financial institutions. The pension and profit-sharing funds and individual trusts we've handled have consistently earned top dollar. Our records prove it.

And we're ready to do our best for your portfolio. Now. First, by sitting down together and discussing your plans. Your goals. Your objectives.

Next, we come up with a program custom-fitted to your needs. To your company's future. Or to your family's future.

Then we keep you up to date by phone, personal meetings and newsletters. So you're never out of touch. And we're never out of reach.

If that sounds good to you, we've made it easy for you to get more details on our personal or corporate investment services.

Just call Larry Rosenthal, our man in charge of personal trusts, at 301/332-5515. Or Jay Neale, in charge of employee benefit plans, at 301/332-5877.

What you do with your money is their business.

House of Delegates

The House of Delegates met in Semiannual session on Sept. 29, 1979 and took the following actions:

1. Approved the meetings of House sessions on May 2 and 5, 1979.
2. Adopted the Auditor's Statement for the 1979 calendar year.
3. Received various Committee Reports on which members were given an opportunity to ask questions or comment.
4. Adopted Memorial Resolutions for A. Austin Pearre, MD, Frederick; Lila H. Youngquist, Montgomery County and Paul V. Joliet, MD, Hagerstown.
5. Adopted a Congratulatory resolution to J. Roy Guyther, MD, of Mechanicsville, on the occasion of his selection as Family Physician of the Year and his recognition by President Jimmy Carter.
6. Elected various members to the Board of the Maryland Foundation for Health Care.
7. Recommended a bylaws amendment dealing with a change in the manner of establishing dues.
8. Adopted a bylaw amendment dealing with a requirement that members of the Legislative Committee be full voting members of the Faculty.
9. Adopted the following resolution as recommended by the Liaison Committee with the Department of Health and Mental Hygiene:

Resolution 1S/79

Adopted without dissent, Sept. 29, 1979

Discrepancy in Medicaid Fee Payments between those paid to Physicians and those paid for identical services rendered in hospital settings

WHEREAS, When the Federal Government enacted the Medicaid and Medicare law, it was predicated on the principle that all citizens would be treated alike and that physicians and others would be paid as they were for private patients and

WHEREAS, There is currently a major differential between what is paid a physician under the State Medicaid program as compared to that paid hospitals for identical services rendered in these institutions and (Note 1)

WHEREAS, Despite attempts by the Liaison Committee of the Medical and Chirurgical Faculty to correct this discrepancy, no progress has been made and

WHEREAS, This major differential is discrimina-

tory and has caused many physicians to discontinue adding new Medicaid patients to their practices, and has, possibly, influenced some physicians to discontinue seeing Medicaid patients and

WHEREAS, Various public interest groups and governmental agencies have recognized this discrepancy and urged its correction and (Note 2)

WHEREAS, Inappropriate use of hospital facilities by Medicaid patients increases unnecessarily the cost of health services under the Medicaid program and has increased rapidly the total cost of "hospital" payments in the Medicaid budget for the Department of Health and Mental Hygiene and

WHEREAS, Medicaid patients should receive continuity of care from a personal physician, something difficult, if not impossible, for them to receive under the present system and

WHEREAS, the usual, customary and reasonable payment basis for Medicaid services rendered provides the most appropriate levels of reimbursement to physicians, recognizes differences in charging patterns that validly exist and encourages physicians to see such patients, therefore, be it

Resolved, That the Medical and Chirurgical Faculty goes on record as supporting, in principle, any Department of Health and Mental Hygiene proposal to reallocate Medical Assistance Program funds so as to increase physician reimbursement to the usual, customary and reasonable rate of private physicians so the system will be competitive and result in total reimbursement not exceeding the total budgeted dollars.

NOTE 1: Physician office visit fee paid, as of July 1, 1979, was \$9 per visit; (\$6.98 for FY 1978) Hospital visit fee paid ranges from \$25 to \$67, average is \$46.62, FY 1978.

NOTE 2: Health Services Cost Review Commission
Maryland Health Planning and Development Agency
Central Maryland Health Systems Agency
Southern Maryland Health Systems Agency
Montgomery County Health Systems Agency
Maryland Conference for Social Concern

10. Endorsed unanimously, the candidacy of Russell S. Fisher, MD, Baltimore, for a seat on the AMA Board of Trustees.

Executive Committee

The Executive Committee met on Oct. 11, 1979 and took the following actions:

1. Designated Donald M. Spangler, MD, Baltimore, to serve on a Blue Cross Physicians Review Panel as a replacement for a physician who has retired from active practice.

2. Deferred action on a request for financial assistance from a physician's widow.

3. Endorsed the principle of a proposed study by the Maryland Institute for Public Health Research that would deal with identification at an early stage of traits that lead to impaired physicians.

4. Increased the per diem for the Maryland Delegation to the AMA House of Delegates sessions from \$35 to \$55.

5. Referred to the Committee on Drugs a question raised by the Commission on Medical Discipline on the unauthorized dispensing of drugs by physicians and in "public clinics."

6. Approved expending \$1,300 from the Educational Fund for the purpose of continuing the series presented by WBJC-FM radio on health issues.

7. Referred to the Policy and Planning Commission a suggestion the Faculty provide non-voting membership for Physician Assistants, or a Faculty "section" involving this category of health personnel.

8. Approved introduction of legislation dealing with wrongful use of civil proceedings.

9. Authorized legal counsel to speak on an informal basis with the Workmen's Compensation Commission to clarify with insurance carriers the "Guide" published by the Commission.

10. Established a Task Force to review present policy and recommend any changes in providing legal defense for members of Faculty and Component Society committee members.

11. Authorized the Economics Committee to poll all state societies to ascertain the range of financial fringe benefits offered their members.

12. Established a new format for the meeting of Component Society Presidents and Secretaries and Statewide Specialty Society Presidents and Secretaries, and set Wednesday, March 26, 1980 as the date for this meeting.

13. Authorized recommendation of a physician for appointment to the Medical Advisory Board, Motor Vehicle Administration.

14. Approved exploration of the potential involved in reviewing costs of compliance by physicians with various governmental laws and regulations.

15. Authorized the President to designate a nominee to serve on the Advisory Board of Hospital Construction.

16. Approved support of the candidacy of John M. Dennis, MD, Dean of the University of Maryland School of Medicine, for the post of Chancellor, University of Maryland Baltimore City Campus.

17. Designated a Task Force to review proposals being offered for assessment of quality of care for inpatients.

18. Approved a revised wage and salary policy. □

Sen. McGuirk Speaks

BCMS sessions with leading legislators resumed in July, 1979. **Ian R. Anderson, MD**, Chairman of the Legislative Committee, arranged the meeting of Directors and Committee Members with State Senator Harry McGuirk. With our lobbyist, Richard Rombro, present, it was like a reunion. Sen. McGuirk, with a little prodding, reviewed the sources of many anti-physician sentiments in the Legislature. He told again some of the intricacies of our State legislative process and explained how bringing pressure to bear in the wrong place, committee or department never gets anywhere. It might be "McGuirk's Law:" You have to know who's in charge before you can start." It was mentioned that action against physicians hurts the patients.

Directors Meet

The Directors met in August. **Roland T. Smoot, MD**, Chairman of the Policy and Planning Committee, announced that component societies are now expected to appoint their representatives to Med-Chi's three committees: Legislative, Health Planning and Policy and Planning. So far, BCMS has had no policy on the naming of such representation. Dr. Smoot proposed interlocking BCMS and Med-Chi choices. For the Legislative and Health Care Committees, the Chairman of the BCMS Committee should be our representative to the Med-Chi counterpart. If unable to serve, a Vice Chairman can be named. The Med-Chi Policy and Planning Committee involves a three-year term, however. It seemed feasible that our Policy and Planning Committee should name a suitable member who would be appointed by the Directors for the three years.

Bylaws

Agreeing with the Bylaws Committee recommendation given by Chairman **William J. McClafferty, MD**, the Directors voted, in our own elections, that a plurality was preferable to requiring a majority. Our Bylaws need not be changed for this purpose.

Members Nominated

Our Directors responded to a request by **Bernard S. Karpers, Jr., MD**, Med-Chi Secretary, for nominees to the Maryland Foundation for Medical Care. Renomination of our present representatives, whose terms end this year: **Timothy D. Baker, MD**; **Edward J. Kowalewski, MD** and **Nicholas J. Fortuin, MD** will be forwarded.

1980 Physical Fitness Fair

Vincent Fitzpatrick, MD, reported progress of the Physical Fitness Fair for next Spring. The Fair's theme will be "It's fun to be healthy!" Dates are April 12-13 at

the Baltimore Convention Center. Robert Mancke of the BCHD is Chairman of the Board planning the Fair. Incorporation papers are being drawn up and, if approved by our legal counsel, will be signed by BCMS's representative on the Committee. General responses from possible participants have been good, but financial support is not completely firm as yet. Although initiated as a health fair for women, any gender discrimination has disappeared.

A New Annual Meeting...

Something new in BCMS Annual Meetings is coming. Sentiment to both have our meetings in our own city, as well as for a change in format, combined to bring it about. It's timely, too, since this is BCMS's own 175th anniversary as a Society and 75th as a component of Med-Chi.

So, on Thursday, Dec. 6, 1979 at 6:30 PM, we will meet at Center Stage, 700 N. Calvert St., for our Annual Business Meeting and refreshments, to be followed by a stage show of **A Christmas Carol: Scrooge and Marley** as adapted by Israel Horovitz and interpreted by the Center Stage cast. It will be a good idea to get reservations in early. Parking will be ample.

General Meeting

Our regular General Meeting in September, 1979, was sponsored by our Auxiliary, who were present in charming numbers. Routine business was promptly handled by President **Albert M. Antlitz, MD**. **William J. McClafferty, MD**, Chairman of the Bylaws Committee, gave a first reading of the many changes in our Bylaws made necessary by recent changes in our meetings schedule, dues structure and membership requirement. These will be printed and sent to members prior to the vote at the next meeting.

The scientific part of the meeting was **Challenges in the Management of Breast Cancer: Surgical, Radiotherapeutic and Medical Aspects**.

R. Robinson Baker, MD, Surgeon-in-charge at the Oncology Center of Johns Hopkins Hospital, began with a comparison of screening methods. Physical examination, mammography and thermography are decreasingly effective—in that order. Clinical management, though becoming more versatile, lacks long-term controls. Noting that, prior to 1970, radical surgery was done at Hopkins with very few excision-biopsy for controls, he said that since 1971, the reverse is true. Without controls, long-term statistics have little value. Management ranges from biopsy-excision, pre-treatment excision and the use of isotope scans. Seven variations on management were statistically compared as to outcome, both pro and retrospectively.

Martin D. Abeloff, MD, Director of the Johns Hopkins Oncology Center, spoke on the importance of preventing recurrences and non-surgical methods to achieve it. Prognosis of recurrence is related to the presence of neoplastic cells in the lymph glands. They have found survival is better if less than four are involved. He reviewed the three major prongs of attack: 1) cytotoxic, chemotherapeutic; 2) endocrine, additive or ablative; 3) immunosuppressive. Each has its own risks and its own statistical probability of cure. Dr. Abeloff called attention to the European countries that

reported improved results with combined chemotherapy long before the United States did—while we were still involved in single-mode chemotherapy. He attributed this superiority in research to the absence of rules of informed consent in those nations.

Stanley E. Order, MD, Director of Radiation Oncology at Johns Hopkins Hospital, emphasized the need to consider the whole patient, in particular the psychologic impact of having cancer. Dr. Order considered the seven primary treatment schedules further, from 'lumpectomy' without or with radiotherapy pre- or post-operation. The significance of inner and outer quadrant lesions with respect to metastases is different and important. Reserving radiotherapy to treat recurrences had its advocates also.

Dr. Order stressed repeatedly that there are many options in therapy selection and insisted that the patient should have his/her say about it. He found statistics nowhere so firm that unacceptability to the patient can be justified. He showed slides of the improvements in reconstruction surgery available today, even to aureolar transplantation. Anti-estrogen compounds, although dependent on the presence of steroid receptors for effectiveness, do offer improved, i.e., with less side effects, therapeutic pathways to success. With regard to metastases, he said, prevent or treat early. □

Christmas Sherry and Auction for Anne Arundel County Auxiliary

The Auxiliary to the Anne Arundel County Medical Society is planning its fifth Christmas Sherry and Auction. This has become one of our most successful annual events.

The Sherry is held at the home of one of our members. It is beautifully decorated for the Holiday Season, which adds to the festivities. Each member brings a gaily-wrapped gift for the Auction. To help the auctioneer, a note is placed on each gift suggesting a suitable value for the package.

After a social hour and light lunch, the Auction begins. It doesn't take long for everyone to get into the spirit of the occasion, and we soon reach our objective: funds to help the less fortunate to enjoy Christmas.

The first year, the proceeds were used to help two Vietnamese families. The St. Vincent de Paul Society received the money for the next two years. Members of the St. Vincent de Paul Society dispense the money on the basis of need.

Last year, we 'adopted' five families in the country through the Department of Social Services. The Social

Worker gave us the first names, ages and sizes of the children of the families. There were a total of 17 children. In addition to the gift for the Auction, our members brought used clothing and staple food items.

The money from the Auction was used to purchase more food, which included canned hams, fresh fruits and vegetables, canned goods and toilet articles. Along with the food and clothing, each family received a gift certificate for a local shoe store. The remainder of the \$925 proceeds was given to the St. Vincent de Paul Society.

Committee members did the shopping and sorting for the various families. This made the busy Christmas-time even more hectic; however, each agreed that her Christmas was more memorable knowing that five other mothers were able to give their children "A Very Merry Christmas."

Discipline Commission Action

Editor's Note: On instruction of the Council of the Medical and Chirurgical Faculty of the State of Maryland, "Findings of Fact, Conclusions of Law and Order" will be published in the JOURNAL.

IN THE MATTER OF RICHARD TYSON, MD BEFORE THE
COMMISSION ON MEDICAL DISCIPLINE OF MARYLAND

Findings of Fact, Conclusions of Law and Order

Upon certain information coming to its attention pursuant to the provisions of Article 43, §130 of the Annotated Code of Maryland, the Baltimore City Medical Society conducted an investigation of Richard Tyson, MD (the "Respondent"). Thereafter, the Commission on Medical Discipline of Maryland (the "Commission") after considering the report and recommendations submitted, determined to charge the Respondent with violation of the following subsection of Article 43, §130(h):

(4) the physician has been charged with a crime involving moral turpitude, and has entered a nolo contendere or guilty plea or has been convicted of a crime.

Appropriate notice of the charge and the ground from which it arose was given to the Respondent and hearing on said charge was held on Aug. 21, 1979. The following members of the Commission were present at the hearing: John E. Adams, MD; Albert M. Antlitz, MD; Jerome J. Coller, MD; Arthur T. Keefe, MD; Eli M. Lippman, MD; William Pillsbury, Jr., MD and Frank M. Shipley, MD. John E. Adams, MD presided as Chairman of the Commission. Also present were Jack C. Tranter, Assistant Attorney General, to advise the Commission as to rules of evidence and Susan K. Gauvey, Assistant Attorney General to present the case on behalf of the Commission. The Respondent appeared with George L. Russell, Jr., Esquire, his counsel.

Following introductions, Ms. Gauvey presented the Commission's case, which consisted of the following documentary evidence:

State's Exhibit #1—Certified copy of the indictment in **US of America v. Richard F. Tyson**, US District Court for the District of Maryland, Criminal No. H-77-015.

State's Exhibit #2—Certified copy of the judgment and probation/commitment order in **United States of America v. Richard F. Tyson**, US District Court for the District of Maryland, Criminal No. H-77-015.

State's Exhibit #3—Certified copy of various proceedings before the Honorable Alexander Harvey II.

Following introduction of this evidence, Ms. Gauvey rested her case.

Mr. Russell then presented the case on behalf of the Respondent. The following documentary evidence was produced:

Respondent's Exhibit #1(a)—Copy of a memorandum dated May 14, 1979 and attachments from Francis W. Lanasa, US Probation Officer, to the Honorable Alexander Harvey II, US District Judge.

Respondent's Exhibit #1(b)—Copy of a certificate of the American Academy of Family Physicians.

Respondent's Exhibit #1(c)—Copy of a certificate of the University of Maryland School of Medicine Family Practice Program.

Respondent's Exhibit #1(d)—Copy of a letter dated July 10, 1979 from C. Earl Hill, MD to the Respondent.

Respondent's Exhibit #1(e)—Copy of a letter dated October 11, 1977 from Stephen D. Wilson to the Respondent.

Respondent's Exhibit #1(f)—Copy of a letter dated March 10, 1977 from Elliott R. Fishel, MD, Chairman, Peer Review Committee, Baltimore City Medical Society to the Respondent.

Respondent's Exhibit #1(g)—Copy of the American Medical Association's Physician's Recognition Award issued to the Respondent.

Respondent's Exhibit #1(h)—Copy of a certificate of the American Academy of General Practice issued to the Respondent.

Respondent's Exhibit #1(i)—Copy of a letter dated Dec. 10, 1973 from the American Board of Family Practice to the Respondent indicating that he is a diplomate of that board.

After testimony was heard from the Respondent and closing arguments were made by both Ms. Gauvey and Mr. Russell, the hearing was concluded.

Findings of Fact

The Commission finds:

1. That the Respondent pled guilty to one count of 18 USC Sections 1341 and 2, mail fraud, aiding and abetting.
2. That the Respondent was sentenced to a fine of \$1,000 and was placed on probation for a period of three years.
3. That the Respondent is Board certified in his speciality and appears to be a competent practitioner.

Conclusions of Law

From the foregoing Findings of Fact, the Commission concludes that the Respondent has been charged with a crime involving moral turpitude, 18 USC Sections 1341 and 2, mail fraud, aiding and abetting, and has been convicted of one count of such crime. Accordingly, the Commission by an unanimous vote adjudicates the Respondent GUILTY of violating Article 43, Section 130(h)(4) of the Annotated Code of Maryland.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 4th day of September, 1979 by the unanimous vote of those members of the Commission hearing this case

ORDERED that the license to practice medicine and surgery in the State of Maryland heretofore issued to the Respondent Richard F. Tyson, MD by the Board of Medical Examiners of the State of Maryland is REVOKED, and be it further

ORDERED that the foregoing revocation shall be effective three months after the date of this Order, and be it further

ORDERED that six months after the effective date of the foregoing revocation such action shall be STAYED with the Respondent placed on PROBATION for two and a half years subject to the following conditions:

1. That the Respondent shall submit to a quarterly review of his practice by the Peer Review Committee of the state medical society or any other body or individual designated by the Commission.

2. That the Respondent shall not engage in activities of the type that led to his criminal conviction.

3. That the Respondent's practice of medicine shall be in accordance with those standards expected from a competent practitioner of medicine in Maryland.

4. That the Respondent shall not treat any person who is referred to him by an attorney as a result of injuries received in an automobile accident and be it further

ORDERED that if the Respondent violates any of the foregoing conditions of probation, or if the Peer Review Committee submits a report that he is not practicing competently, the Commission may, after notification and a hearing, withdraw the stay of the revocation of his medical license or impose any other disciplinary sanction that deems appropriate, and be it further

ORDERED that a copy of this Order shall be filed with the Board of Medical Examiners in accordance with the Annotated Code of Maryland, Article 43, §130(m).

JOHN E. ADAMS, MD, Chairman
Commission on Medical Discipline

Findings of Fact, Conclusions of Law and Order

Upon certain information coming to its attention pursuant to Article 43, §130 of the Maryland Code, the Peer Review Committees of the Medical and Chirurgical Faculty (the "Med-Chi") and the Prince George's County Medical Society conducted investigations into the medical practice of Magin T. Quiambao, MD (the "Respondent"). Thereafter, the Commission on Medical Discipline (the "Commission") determined to charge Respondent with certain violations of the Code. The violations charged involved the following subsection of Article 43, §130(h):

(18) Professional incompetence.

Appropriate notice of the charge and the grounds from which it arose was given to the Respondent and a hearing on said charge was held before the Commission on Aug. 1, 1978. The hearing convened at 2 PM before the entire Commission. The Respondent appeared represented by Henry R. Lord, Esquire. Stephen J. Sfekas, Assistant Attorney General, presented the case on behalf of the Commission. Jack C. Tranter, Assistant Attorney General, advised the Commission on rules of evidence.

Pursuant to an agreement of counsel and with the concurrence of the Commission, the case was presented out of normal order to accommodate several witnesses. David M. Goldman, MD was first called by Mr. Sfekas as a witness for the Commission. His testimony was followed by that of J. Andrew Armer, MD, who testified on behalf of the Respondent. Following this testimony, opening statements were made by Messrs. Sfekas and Lord. As part of his statement, Mr. Lord made and filed two Motions to Dismiss, or in the Alternative to Disqualify, which motions were denied by the Commission. Mr. Sfekas then continued with the presentation on behalf of the Commission. Testimony was heard from Joseph I. Berman, MD; however, after the completion of Dr. Berman's testimony, because the court reporter was unable to continue, it was necessary to continue the hearing. The following documentary evidence was admitted into evidence at this session.

State's Exhibit #1—Copy of a letter dated February 10, 1978, from David M. Goldman, MD to Joseph I. Berman, MD.

State's Exhibit #2—Curriculum Vitae for Magin T. Quiambao, MD.

State's Exhibit #3—Report on an office visit to Dr. Magin T. Quiambao.

State's Exhibit #4—Curriculum Vitae for Joseph I. Berman, MD.

State's Exhibit #5—Copy of a letter dated Apr. 20, 1978, from Magin T. Quiambao, MD to Joseph I. Berman, MD.

State's Exhibit #6—Copy of a letter dated March 27, 1978, from Leopold Weindelmayer addressed to "To whom it may concern."

Respondent's Exhibit #1—Copy of a letter dated September 13, 1977, to the Peer Review Committee from Robert Ruderman, MD.

Respondent's Exhibit #2—Curriculum Vitae for John Andrew Armer, MD.

Respondent's Exhibit #3—Patient record form used by Respondent.

Respondent's Exhibit #4—Copy of a letter dated June 1, 1978, from J. Andrew Armer, MD to Henry R. Lord, Attorney.

Respondent's Exhibit #5—Copy of a letter dated May 23, 1977, from Joseph I. Berman, MD to Perry Hookman, MD.

Respondent's Exhibit #6—Copy of a letter dated September 22, 1977, from David M. Goldman, MD to Joseph I. Berman, MD.

Respondent's Exhibit #7—Copy of a letter dated June 17, 1977 from Joseph I. Berman, MD to Magin T. Quiambao, MD.

The hearing was reconvened on Sept. 5, 1978 before the entire Commission. The Respondent was present represented by Henry R. Lord, Esquire. Mr. Sfekas presented the case on behalf of the Respondent; Mr. Tranter advised the Commission on rules of evidence. The hearing began with the recall of Joseph I. Berman, MD by Mr. Lord. After the completion of Dr. Berman's testimony and the introduction of the following documentary evidence by Mr. Lord, Mr. Sfekas concluded his case.

Respondent's Exhibit #8(a)-(e)—Copies of the annual reports of the Peer Review Committee of Med-Chi for the years 1974-78.

Respondent's Exhibit #9(a)—Copy of a listing of the current members of the Peer Review Committee of Med-Chi.

Respondent's Exhibit #9(b)—Copy of undated correspondence to the members of Council of Med-Chi from Bernard S. Karpers, MD, Secretary.

Respondent's Exhibit #9(c)—Listing of the officers and Committee Memberships of Med-Chi, Apr. 22, 1977 through the Annual Meeting, 1978.

Respondent's Exhibit #10(a)—Copy of an article written by Joseph I. Berman, MD appearing in the February, 1976 **Maryland State Medical Journal**.

Respondent's Exhibit #10(b)—Pamphlet entitled **A Plan for the Reeducation of the Physician in Need**.

Respondent's Exhibit #10(c)—Guidelines used in Reviewing Physician's Office Practice approved by the Med-Chi Council Jan. 19, 1978.

Respondent's Exhibit #11(a)—Copy of a letter dated March 7, 1978 from Joseph I. Berman, MD to the Commission.

Respondent's Exhibit #11(b)—Copy of a letter dated May 8, 1978 from Joseph I. Berman, MD to John E. Adams, MD.

Respondent's Exhibit #12—Curriculum Vitae for Sidney B. Seidman, MD.

Respondent's Exhibit #13(a)—Copy of a memo dated Aug. 22, 1978 from Mrs. Constance Townsend to Dr. Berman.

Respondent's Exhibit #13(b)—Copy of a letter dated Aug. 22, 1978 from Mrs. Constance Townsend to John E. Adams, MD.

Respondent's Exhibit #14(a)-(m)—Copies and originals of various correspondence of the Peer Review Committee of the Prince George's County Medical Society regarding Respondent.

Mr. Lord then moved for a dismissal of certain grounds upon which the charge of professional incompetence had been made against Respondent as set forth in the charge letter dated May 4, 1978. This motion was denied.

Mr. Lord then presented the balance of the case on behalf of the Respondent. Testimony was heard from the Respondent and Salah H. Hosny, MD. The following documentary evidence was also produced.

Respondent's Exhibit #15—Floor plan of the Respondent's office.

Respondent's Exhibit #16(a)-(s)—Various photographs of the Respondent's office.

Respondent's Exhibit #17—Affidavit dated July 31, 1978 from Louis J. Meyer, RPh.

Respondent's Exhibit #18(a) and (b)—Photographs of specimen bottles.

Respondent's Exhibit #19—Copy of the list of contraindications for the Magnatherm.

Respondent's Exhibit #20—Curriculum Vitae for Salah H. Hosny, MD.

Following closing arguments by Messrs. Sfekas and Lord, the hearing was concluded.

Findings of Fact

The Commission finds:

1. That the evidence presented regarding inadequate medical records and X-rays is not sufficient to sustain those allegations.

2. That at the time of the investigation of his practice, Respondent kept tissue he removed during office surgery in unlabelled bottles in which numerous pathological specimens were mixed.

3. That the retention of specimens in this fashion makes it absolutely impossible to identify specific specimens.

4. That following the date of the investigation of his practice and prior to the conclusion of the hearing, the Respondent altered his storage techniques so that now specimens are placed in separate bottles which are properly labelled.

5. That Respondent's practice of sending less than an entire surgical specimen for pathological study is not medically acceptable.

6. That at the time of the investigation of Respondent's practice there was no means for verification of sterilization procedures.

7. That following the investigation and prior to the conclusion of the hearing, the Respondent began using a strip which verifies adequacy of sterilization procedures.

8. That patients who call Respondent for emergency care are directed by an answering machine to go to an emergency room at a local hospital.

9. That Respondent is contacted by the emergency room when one of his patients arrives for care.

10. That Respondent has coverage by another physician when he is out of the area.

11. That if Respondent is not at home or in the office when he is called, he has a beeper with which he can be contacted.

12. That Respondent's system of coverage, while not ideal, is adequate.

13. That at the time of the investigation of Respondent's practice, it was discovered that vials of testosterone and estrogen used for injections were contaminated with Vitamin B-12.

14. That at the time of the investigation of Respondent's practice the vast majority of the frozen biologicals discovered in Respondent's refrigeration were outdated.

15. That at the time of the investigation of Respondent's practice when questioned about what he would do in the event of anaphylactic reaction, Respondent produced adrenalin which was out-of-date.

16. That following the investigation and prior to the conclusion of the hearing Respondent began to segregate out-of-date vaccines being held for drug company pick-up and reimbursement from the biologicals in current use.

17. That at the time of the investigation of his practice, Respondent gave injections of Vitamin B-12 and testosterone for impotency and fatigue.

18. That Respondent also used injections of Vitamin B-12 for patients who complained of fatigue without performing any laboratory studies to determine if the patients were, in fact, suffering from pernicious anemia which would be an indication for the use of this drug.

19. That there is no medical reason to use Vitamin B-12 alone or in combination with testosterone in the manner Respondent does in his practice.

20. That of the patient records reviewed during the investigation of Respondent's practice, the overwhelming majority reflected that patients were receiving some sort of injection.

21. That many of the records reviewed contained no information which would justify Respondent's use of the particular injectible involved.

22. That Respondent's use of ACTH with antibiotics to treat infections cannot be justified medically.

23. That at the time of the investigation of Respondent's practice, it was determined that when administering penicillin by injection, Respondent simultaneously administered cortisone which he believed would prevent anaphylactic shock.

24. That there is no medical basis for the use of cortisone in connection with penicillin to prevent anaphylactic shock.

25. That following the investigation, but prior to the conclusion of the hearing, Respondent discontinued this use of cortisone.

26. That at the time of the investigation, Respondent demonstrated incomplete knowledge to treat the following conditions:

- (a) Gonococcal urethritis.
- (b) Streptococcal pharyngitis.
- (c) Urinary tract infections.
- (d) Anemia.
- (e) Upper respiratory tract infections.

27. That following the hearing, at the Commission's request, Respondent agreed to submit to a review of his medical knowledge by the Family Practice Program at the University of Maryland, School of Medicine for the purpose of aiding the Commission in its disposition of this case.

28. That the findings and recommendations made by the Family Practice Program have been considered by the Commission only as to the disposition of this matter and not as to the specific factual findings as set forth in paragraphs 1-26 above.

Conclusions of Law

Based upon the foregoing Findings of Fact, the Commission concludes as a matter of law that the charge of professional incompetence has been sustained.

Order

Upon the foregoing Findings of Facts, Conclusions of Law and based upon a review of Respondent's present medical competence and recommendations by Drs. Richard C. Arbogast, Peter M. Hartman and M. William Voss, all of the Family Practice Program, University of Maryland School of Medicine, it is this 9th day of February, 1979 by the unanimous vote of those members of the Commission on Medical Discipline hearing this case.

ORDERED that Respondent is hereby placed on PROBATION subject to the following conditions:

1. That Respondent shall undertake a preceptorship program at his own expense with the program and preceptor to be approved by the Commission.

2. That Respondent shall modify his standards of practice as required by the preceptor.

Parole Professional Center

A unique professional center

Located at corner of Riva Rd. and Holiday Ct., near Woodward & Lothrop across from Parole Shopping Center, the largest shopping center in Annapolis area.

Occupancy • Winter • 1979

Complex of three buildings in colonial town-house style, containing 39 suites, 90% at ground level. Each will have private entrance, recessed lighting, modern energy-saving heat pumps, individually controlled air-conditioning units, double hung insulated windows, carpeting and custom-designed layout. 164 parking spaces. Suite range, 880 to 1300 sq. ft., with multiple combinations, catering especially to the professional.

Leasing and Management by:

3. That Respondent shall submit to quarterly reviews of his practice by the appropriate unit of the Prince George's County Medical Society.

4. That Respondent shall arrange for the preceptor and the unit of the Prince George's County Medical Society reviewing his practice to submit quarterly reports to the Commission evaluating his improvement.

5. That Respondent shall arrange for the preceptor and the Prince George's County Medical Society to submit to the Commission nine months after the date of this Order a report regarding Respondent's medical abilities, and be it further

ORDERED that if Respondent violates any of the foregoing conditions of probation, if the quarterly reports submitted indicate that his medical skills are not improving or if the reports submitted nine months after the date of this Order do not indicate that Respondent has achieved those standards expected from a person engaged in the independent practice of family medicine in Maryland, the Commission may, after notification and a hearing, take any disciplinary action against Respondent's medical license it deems appropriate upon any such showing, and be it further

ORDERED that this Probation shall continue until such time as the Respondent's practice is deemed acceptable by the preceptor, the unit of the Prince George's Medical Society reviewing Respondent's practice and the Commission. In that regard, the Commission shall entertain, one year after the date of this Order, a petition for the termination of the Respondent's probationary status. At that time, should it determine that the termination of probation would not be appropriate, the Commission may alternatively consider a request to modify one or more of the conditions upon which Respondent was placed upon probation; and be it further

ORDERED that a copy of this Order shall be filed with the Board of Medical Examiners in accordance with the Annotated Code of Maryland, Article 43, Section 130(m).

Order

On Feb. 6, 1979, a hearing was held before John E. Adams, MD; John G. Ball, MD; Jerome J. Coller, MD; Vincent Fiocco, MD; Arthur T. Keefe, MD; Francis D. Mayle, Jr., MD; Eli H. Lippman, MD; Karl F. Mech, MD and Frank Shipley, MD, constituting the entire Commission on Medical Discipline. This hearing was convened to consider a petition for reinstatement filed by Paul Schonfeld, MD (The "Petitioner") whose license to practice medicine in Maryland had been revoked on Apr. 26, 1977. Petitioner appeared without counsel. Jack C. Tranter, Assistant Attorney General, was present on behalf of the Commission.

Dr. Adams, Chairman of the Commission, introduced into the record the following documentary evidence that had been forwarded to the Commission by Petitioner.

1. **Exhibit #1**—Packet of letters and other materials forwarded to the Commission.

2. **Exhibit #2(a)**—Copy of a letter dated July 31, 1978 from Edward J. Kowalewski, MD addressed to "My Physician Peers and Medical Institute of the United Kingdom."

3. **Exhibit #2(b)**—Copy of a memorandum dated Aug. 18, 1977 from Edward J. Kowalewski, MD to John E. Adams, MD, Chairman, Commission on Medical Discipline, and Joseph I. Berman, MD, Chairman, Med-Chi Peer Review Committee.

4. **Exhibit #2(c)**—Memorandum dated Apr. 17, 1978 from Edward J. Kowalewski, MD to John Adams, MD, Chairman, Commission on Medical Discipline, and Joseph I. Berman, MD, Chairman, Med-Chi Peer Review Committee.

5. **Exhibit #2(d)**—Copy of a memorandum dated Dec. 4, 1978, from Edward J. Kowalewski, MD to John Adams, MD, Chairman, Commission on Medical Discipline.

Following testimony by Petitioner and questioning by the Commission, the hearing was concluded.

Based on the testimony and documentary evidence the Commission finds:

1. That by Order dated Apr. 26, 1977 Petitioner's license to practice medicine in Maryland was revoked.

2. That the Commission's Apr. 26, 1977 Order indicated that it would entertain a petition for reinstatement of license on or after Jan. 18, 1979 and at such time would consider factors such as Petitioner's efforts to maintain his competence, his involvement in his community and his efforts in the area of Continuing Medical Education.

3. That after the Commission's Apr. 26, 1977 decision revoking his license, Petitioner contacted Edward J. Kowalewski, MD, Professor and Head, Family Practice Program, University of Maryland School of Medicine regarding an educational program that would maintain his competence as a physician.

4. That Dr. Kowalewski recommended a program designed not only to maintain competence, but also to improve Petitioner's practice, attitudes and behavior.

5. That Petitioner has successfully completed the program designed by Dr. Kowalewski.

6. That following the completion of the program designed by Dr. Kowalewski, Petitioner voluntarily continued his educational efforts with the Family Practice Program at the University of Maryland School of Medicine.

7. That Dr. Kowalewski has stated that Petitioner "has achieved a remarkable result in his reeducation effort to the point where, without reservation, we recommend that he be fully reinstituted to the practice of medicine."

Based on the foregoing finding, it is this 6th day of February, 1979 by a majority vote of the entire Commission on Medical Discipline

ORDERED that the license to practice medicine in Maryland issued to Paul Schonfeld, MD which had been revoked by Order dated Apr. 26, 1977 is hereby REINSTATED, and be it further

ORDERED that one year from the date of this Order Dr. Schonfeld shall file a report advising the Commission as to the nature and status of his medical practice, and be it further

ORDERED that a copy of this Order shall be filed with the Board of Medical Examiners in accordance with Article 430, Section 130(m) of the Maryland Code.

JOHN E. ADAMS, MD, Chairman
Commission on Medical Discipline

Hopkins Reports Use of Safer Prenatal Sickle Cell Anemia Test

A new prenatal diagnostic test for sickle cell anemia is now being used at the Prenatal Diagnostic Center of the Johns Hopkins Hospital. The test, a genetic analysis of fetal cells found in amniotic fluid—the liquid that surrounds the fetus—promises to be safer than techniques which require analysis of fetal blood.

Johns Hopkins is the first medical center in the East to use the technique, and only the second in the country. The test, which is based on the restriction enzyme technology for which two Hopkins scientists, Drs. **Daniel Nathans** and **Hamilton Smith**, won the 1978 Nobel Prize in Medicine, was developed at San Francisco General Hospital by Dr. **Y. W. Kan**. The Hopkins experience with the test is described in a recent issue of **The Johns Hopkins Medical Journal** by a group of scientists including Drs. John A. Phillips, III; Alan F. Scott; Haig H. Kazazian, Jr. and Kirby D. Smith.

Until now, the only prenatal test for sickle cell anemia depended on withdrawing blood samples from the fetus. That method involves increased risk to the fetus and often results in difficult diagnosis if the fetal blood samples become contaminated by maternal blood. The fetal blood test is based on the discovery by Dr. Kazazian, Professor of Pediatrics, that the second trimester fetus makes a small amount of adult hemoglobin.

The new restriction enzyme techniques requires only an amniocentesis, the extraction of amniotic fluid from the mother's womb, a procedure already routine in other types of prenatal diagnosis. The DNA of fetal cells in the amniotic fluid is then mixed with a specific restriction enzyme, a "chemical knife" that cleaves DNA at specific sites. The restriction enzyme "recognizes" a site on DNA near the gene for normal hemoglobin, but this site is absent in the DNA near the gene for abnormal sickle cell hemoglobin. Thus, the length of DNA containing the sickle cell gene is different from the length of DNA containing the normal hemoglobin gene. Since DNA containing most, but not all, sickle cell genes has this different length, couples at risk for sickle cell anemia should consult the Center prior to 14 weeks of pregnancy.

The restriction enzyme technique is also being used to diagnose other types of hemoglobin disorders and, hopefully, in the future these techniques will be used to diagnose other types of genetic disorders as well.

Sickle cell anemia is an inherited disease of hemoglobin, the red coloring matter in blood cells which carries oxygen throughout the body. The disease mostly affects Blacks and some people of Mediterranean origin. The blood cells of people with sickle cell anemia become distorted and form "log jams" in tiny blood vessels, causing painful "sickle cell crises" and organ damage from lack of oxygen.

The disease is a recessive trait, which means that if both parents carry a gene for sickle cell anemia, each

child has a 25% chance of inheriting the disease. About one in every 400 Black babies born in this country has sickle cell anemia. Many face severe complications and shortened lifespans.

Other authors of the article were Drs. Gail Stetten and George H. Thomas. □

Taylor Manor Psychiatric Hospital offers a Prize and Trip for Essay on Psychiatric Emergencies

Award Details

This award is being offered to the medical student, intern or resident under 35 years of age who authors the best manuscript on any aspect of Psychiatric Emergencies (acute functional/organic psychoses, acute confusional states, panic reactions, drug overdoses, etc.). Winner will receive a cash prize of \$250 plus travel expenses to attend and to read the essay at the 12th Annual Taylor Manor Hospital Psychiatric Symposium in Ellicott City, MD on **Psychiatric Emergencies: Diagnostic and Management Challenges**, on Apr. 12, 1980.

Manuscript already submitted for publication or published is ineligible. Abbreviations should be kept to a minimum; their use is acceptable in lieu of lengthy terms. Medical abbreviations are acceptable if listed in **Dorland's Medical Dictionary** and the **AMA Style Book and Editorial Manual**. References should be cited in a consecutive manner in the text and not alphabetically by author. They should be listed in numerical order at the end of the paper. Their number is limited to 20.

An original and one copy of the double-spaced, typed manuscript (maximum 3,000 words) must be submitted by Feb. 15, 1980 to Frank J. Ayd, Jr., MD, Symposium Director, Taylor Manor Hospital, Ellicott City, MD 21043. Further details on the competition may be obtained from Dr. Ayd at (301) 465-3322.

This award is being offered in conjunction with the 1979-80 Taylor Manor Hospital Psychiatric Symposia Series.

IRVING J. TAYLOR, MD, Medical Director
EDITH L. TAYLOR, Executive Director
FRANK J. AYD, JR., MD, Symposium Director
FRANCES C. CARD, Symposium Secretary □

Adams Lecture

The University of Maryland School of Medicine recently announced the endowment of an annual lecture in memory of **Thurston R. Adams, MD**, an alumnus of the School of Medicine and former Professor in the Department of Surgery.

The Dr. Thurston R. Adams Memorial Lecture in Surgery is being made possible by an endowment fund sponsored by the University of Maryland School of Medicine and the immediate family of the late Dr. Adams in recognition of his many contributions to the educational and service programs of the medical school and the University of Maryland Hospital. Tribute fund gifts received by the Medical School in memory of Dr. Adams accounted for two-thirds of the endowment, and, one-third of the fund was contributed by Mrs. Thurston R. Adams, Mr. and Mrs. Thurston R. Adams, Jr. and Mr. and Mrs. Gordon L. Adams.

A prominent alumnus of the School of Medicine (1934), Dr. Adams was Associate Professor of Surgery at the school until his retirement in January, 1978, serving more than 43 years as a member of the Faculty. He was also Chief consulting surgeon for the Baltimore and Ohio Railroad for 35 years.

A sports enthusiast, Dr. Adams was a founder and charter member of the University of Maryland Terapin Club. He also served for long periods as head of the medical school's Admissions Committee and its Credentials Committee.

Dr. Adams was a Fellow of the American College of Surgeons, a Diplomate of the American Board of Surgery and a member of the

Baltimore City Medical Society, the Medical and Chirurgical Faculty of Maryland and the University of Maryland Surgical Society.

Franklin Square

Franklin Square Hospital in Essex, MD recently opened a new, short-term, 20-bed inpatient Psychiatric Treatment Center for the care of adults and older adolescents in crisis.

Joseph English, MD, a prominent, national figure in the field of psychiatry, was the hospital's guest for the entire day. Dr. English is the Director of Psychiatry at St. Vincent's Hospital in New York City.

He spent the day with Dr. **M. Lawrence Spoot**, Chairman of the newly-created Department of Psychiatry at Franklin Square, touring the Hospital and the Unit.

He also delivered a scientific lecture on the development of general hospital psychiatry to the medical and house staffs of Franklin Square.

The medical director of Sheppard and Enoch Pratt Hospital, Dr. **Robert Gibson**, was the guest speaker at the dedication, discussing the role of the general hospital in American psychiatry.

Dr. Gibson was joined in the program by psychiatrists from the Baltimore community. An open house and tour of the unit followed.

The Psychiatric Inpatient Unit is an open, unlocked unit, designed for short-term psychiatric care. Patients spend anywhere from a few days to four weeks on the acute unit.

The self-contained unit is equipped with its own kitchen, laundry room and dining area.

According to Dr. Spoot, the treatment program emphasizes

development and maintenance of an individual's coping skills in relation to personal, family, occupational and community adjustment.

"Treatment will be provided by a highly trained staff, including psychiatrists, a psychologist, social workers, psychiatric nurses and a recreation therapist," noted Dr. Spoot.

Individual, family, group and recreational therapies are available in the treatment program. Therapeutic plans are personalized, said Dr. Spoot, and include arrangements for follow-up care within the community.

The full range of medical services provided by Franklin Square are available to individuals on the Psychiatric Inpatient Unit when needed for comprehensive diagnosis and treatment.

In addition, members of the Department of Psychiatry provide consultation-liaison services to patients on all other units in the hospital who need psychiatric evaluation or help.

Dr. Spoot said working relationships have been established with the Eastern Community Mental Health Center in Baltimore County and such relationships will be extended to other mental health clinics and appropriate agencies.

"Our goal in the Department is to work cooperatively with the ECMHC and other mental health centers to make the Psychiatric Unit readily accessible to patients from those centers." □

Cover Story: Health in History

Britain's Admiral Lord Horatio Nelson

By BLAINE TAYLOR

Contact Mr. Taylor, **Journal** Managing Editor, for reprint and further information c/o the **Journal**, 1211 Cathedral St., Balto., MD 21201.

Introduction

Since September, 1975, the **Journal** has been publishing a series of articles describing how health—or the lack of it—has played a significant part in the shaping of international political events and history.

This installment marks the fourth such piece culled from the rich period of the Napoleonic Wars era of 1795-1815, the prior articles being **A Bicentennial Special: England's King George III — The Mad King/A Medical Casefile** (July, 1976); **A Medical View of Napoleon I** (September, 1976) and **Some Medical-Historic Aspects of the Later Napoleonic Wars, 1812-15** (December, 1978.)

Nelson's Place in History

Since its defeat of the mighty Spanish Armada in 1588—and until it was superceded by the US Navy at the end of the Second World War in the Pacific in August, 1945—the British Navy was the globe's greatest. It was confirmed in this preeminent maritime position by a series of brilliant naval victories by the British Empire's most renowned seaman of all time, Admiral Sir Horatio Nelson, a Viscount and Knight of the Bath.¹

These stunning, spectacular victories included the Battles of the Nile, 1798; of Copenhagen, 1801 and the most famous, Trafalgar, off the southwest coast of Spain, in 1805. From that date until the building of the Imperial German battlefleet a century later, Britannia's dominion over the waves wasn't seriously challenged. The major credit for these naval triumphs has been universally given by historians of the period to Nelson himself, while he, in his day,

"Gave his men credit...He believed the boldest measures were the safest. Nelson was a fearless leader and patriot."²

Alongwith his contemporary and military peer on land, the Duke of Wellington, Admiral Nelson proved to be the undoing of their

ADMIRAL SIR HORATIO NELSON in 1801, the year of his victory over the Danish fleet and shore batteries at Copenhagen. (Portrait by John Hoppner.)

greatest mutual enemy; revolutionary (and later Imperial) France, as personified by General Napoleon Bonaparte, who became Napoleon I as Emperor of the French in May, 1804. Nelson's victory at sea at Trafalgar the following year both crushed the French Navy and prevented—once and for all—the long-threatened Napoleonic invasion of the British Isles, while Wellington's triumph a decade later at Waterloo in Belgium wrote finis to Napoleon's military power, as well as sending him, personally, to his last, fatal exile on the Island of St. Helena.

Oddly enough, these two greatest figures in the history of British arms chanced to meet only once, in the British Colonial Office, when Nelson was already world-renowned, and Wellington was merely a rather obscure British Army officer.

As Wellington later told the tale:

"He could not know who I was," recalled Wellington, "but he entered at once into conversation with me, if I can call it conversation, for it was almost all on his side and all about himself, and in, really, a style so vain and silly as to surprise and almost disgust me.

"I suppose something I happened to say may have made him guess that I was **somebody**, and he went out of the room for a moment, I have no doubt to ask the door-keeper who I was, for when he came back he was altogether a different man, both in manner and matter. All that I had thought a charlatan style had vanished, and he talked of the state of the country and of the aspect and probabilities of affairs on the Continent with a good sense, and a knowledge of subjects both at home and abroad, that surprised me equally and more agreeably than the first part of our interview had done; in fact, he talked like an officer and a states-

man . . . I don't know that I ever had a conversation that interested me more."³

This illuminating passage well points out "The exhibitionism which had first become apparent in an insecure Rear Admiral . . ."⁴ and this despite the fact that, at the time of the meeting, Nelson was acclaimed, far and wide, as "The Hero" of the nation⁵ and **this** despite the Admiral's long-standing, scandalous, extramarital love affair with the Lady Emma Hamilton, whose husband was one of Nelson's best friends!

The Physical Horatio Nelson

A slim, frail, enigmatic figure, Nelson was an unlikely naval paragon. He . . . "was so puny as a child that his uncle, Capt. Maurice Suckling, once exclaimed, 'What has poor Horatio done . . . that he should be sent to rough it at sea?'"⁶

Moreover, to state it mildly, "Nelson had physical problems: loss of an eye, arm amputation and, finally, he was felled by a bullet in his spine. Nelson twice suffered tropical diseases and went to Canada to recover."⁷ Nelson's self-deprecating wit in later years led him once to compose a limerick on his various afflictions:

"Wounds received by Lord Nelson:
His Eye in Corsica
His Belly off Cape St. Vincent
His Arm at Teneriffe
His Head in Egypt
Tolerable for one War."⁸

One of Nelson's many biographers—A.B.C. Whipple—described him thus as he prepared to put to sea on Sept. 13, 1805 to

find Napoleon's invasion fleet: " . . . a lone, frail figure of a man bracing himself with his left arm as the carriage lurched . . . The man wore the uniform of a Vice Admiral in the Royal Navy. His empty right sleeve was pinned to his coat. His right eye was blind . . . that slight, straight figure . . . half-blind, one-armed man . . ."⁹ The many years spent at sea took their toll on Nelson's never very hardy constitution; by 1797—when he was 39—"His body was shrunk into his uniform. His once-blond hair was white. A livid scar creased the right side of his forehead."¹⁰

Like the young Teddy Roosevelt (who also was a puny, sickly child) later, Nelson strove to overcome his frailties by rising above them through sheer willpower and force of determination—and succeeded. His demanding physical lifestyle, however, wasn't conducive to his overall health, but **did** allow him to accomplish the tasks he set himself: to live a life of glory and to destroy the French fleet.

"Nelson usually rose with the daylight . . . had breakfast with some of his officers and aides in his dining cabin at 6 AM. By 7:02, he had taken a quick walk about the deck and was back in his cabin, going through all the paperwork required to keep his fleet afloat . . . the **Victory's** Chaplain, Dr. Scott . . . had to do most of the reading for Nelson, whose one eye had become so weak that the **Victory's** doctors would not let him use it for more than short periods . . . At noon . . . Nelson usually emerged from his quarters. For three hours, he would pace the deck . . . he kept it up until dinner-time, which, aboard the **Victory**, was 3 PM . . . the Admiral's dinner usually included three courses, a dessert and even wines, but Nelson ate little of it. Too much food upset his stomach or made him seasick . . . After dinner, he would hold conferences with captains of the fleet . . . or go over more reports and letters. Then, he would return to the deck, to continue his ceaseless pacing. Before nightfall, he would walk the deck for five or six hours, covering more than 15 miles every day. By 7 PM, he was back in his cabin for tea and a bit of supper with his officers. The officers usually had a 'nightcap'—a glass of punch and a piece of cake or biscuit—at about 8. Nelson often joined them . . . He was always in his cot by 9. Always, that is, when things were going well.

"But on many of those cold, blustery nights off Toulon, when the crew had had their second tot of grog and their supper and the hammocks had been slung again, the men on the upper gun deck, swinging in their hammocks and trying to sleep, could hear the steady footfalls on the planks only a few inches above their heads. As the green seas broke over the bows, water dripped

A Nelsonian Chronology, 1758-1806

- 1758 — Sept. 29th, born
- 1771 — Joins Royal Navy at age 12
- 1775 — Fever in India
- 1780 — Fever recurs in Nicaragua
- 1781 — August, back at sea after recovery
- 1782 — Ill with scurvy in Canada
- 1787 — March 11th, marries Frances Nisbet
- 1793 — Opposes Napoleon for first time at Toulon
- 1794 — July 12th, blinded in right eye at Corsica
- 1797 — Feb. 14th, Battle of Cape St. Vincent
July 25th, loses right arm at Teneriffe
- 1798 — Aug. 1st, Battle of the Nile; headwound
- 1801 — Daughter Horatia born;
Promoted Vice Admiral of the Blue;
Apr. 2nd, Battle of Copenhagen
- 1802 — April, Nelson ill
- 1804 — June, Attains highest rank
- 1805 — Sept. 29th, 47th and last birthday
Oct. 21st, Battle of Trafalgar and death of Nelson
- 1806 — Jan. 8th, funeral and burial, London. —Table by Blaine Taylor

through the planks into their hammocks. Waves washed through the anchor hawseholes, swishing across the deck and floating the debris of the livestock pens under the sailors' hammocks. The **Victory** groaned and creaked as she worked her way through the heavy seas, but in the pauses between the groaning and the swishing and the pounding, the men could hear it again, sometimes all night long—the steady thud, thud, thud as Lord Nelson paced his lonely way back and forth on the deck of the **Victory**.

The **Victory's** doctors would sometimes wake and worry too. They knew that Nelson was out there on the sea-swept deck in near-freezing temperatures, wearing only a light coat which would soon be soaking wet, and when he returned to his cabin in the early hours of the morning, he would kick off his shoes and walk about his cabin in wet stockings rather than rouse his manservant to take them off. Officer's stockings in those days were tightly fitted and rose to the knee, and Nelson couldn't remove them with his one hand, but the doctors knew that it did no good to argue with the Admiral about how he was endangering his health; they had tried that too many times before, with no success... Nelson developed a racking cough (this was in December, 1804—ed. note.) It weakened him and made him lose weight, and he could not get rid of it."¹

Hazards of the Sea

Life at sea and maritime warfare during the late 18th and early 19th Centuries—as you may have already deduced from the foregoing passages—was no picnic. Essentially unchanged from the days of the Spanish Armada centuries before (and until the American Civil War decades later), the milieu in which Nelson lived most of his life was harsh and unrelenting. He entered it as a midshipman at age 12.

As author Whipple relates:

"As a midshipman, Horatio was crowded into a tiny cabin area with so many others that there was barely room to swing a hammock. On the first windy night, many of the other new boys were seasick. So was Nelson. The ship was battened down, with every opening closed to keep out the flying spray. As everyone grew sicker, the air itself became nauseating.

Through the ship's thick sides could be heard the pounding of the sea, the crash of the waves and the howling of the wind. Inside the cabin, there was the moaning and the retching of seasick sailors. Young Horatio Nelson learned what it took to be a sailor on that first stormy night at sea.

In the next few days and weeks, he learned a great deal more. He learned his way about the floating world of his warship. He learned how hard it was to climb out on a wet yardarm high over the roaring sea on a stormy night. He learned how the British Navy recruited and treated its men. He learned how the men sometimes rebelled, and what happened to them when they did. Above all, he learned to be a naval officer in the finest tradition of the best navy in the world...

To a boy going to sea for the first time, she was a huge ship, with masts so high they made him dizzy and sails that seemed to cover the sky. She carried row on row of big guns along her sides—64 of them, almost enough for a boy to lose count; yet the big ship always seemed crowded below. In the quarters Nelson shared with other young midshipmen, there was space only for his hammock and scarcely any room for stowing his gear, but he was far better off than the seamen in the lower decks. Down below the waterline, there were no portholes and the only light came from lanterns—even in the middle of the day. The men quartered there were so crowded that they could lie in their hammocks and not even swing to the roll of the ship, so closely were they packed.

In fact, a warship in those days did not have enough room for the entire crew to sling hammocks at any one time. The crew was divided into watches, with half the men working while the other half rested or slept...

Much of the work was done aloft, on yardarms higher than a housetop. From the deck he was forced to climb up the rigging until the sailors below looked like midgits. There he could stand on a tiny platform until he got used to the fact that he was swinging far out over the water with every roll of the ship. Then he had to crawl out along the yardarm, hanging on as he tried to keep from missing the footrope and falling while the ship plunged under him. At first, like all new hands, he tried to work with one arm, using the other to hang on for dear life, as he furled sail, but soon an officer was shouting at him, or swinging a knotted rope at him, to make him work with both hands.

Sometimes, when the breeze was light and the ship ran along on an even keel, it was pleasant to stand on the footrope and lean over the yardarm, looking down at the blue sea swishing by and daydreaming as the wind sang softly in the rigging, but then there were nights when all was black and the gale screamed and the sails thundered and the ship plunged so that the masts seemed to keep going right on over into the water. On nights like this, Nelson had to work harder and faster than ever. If he did not, the ship might sink in the storm, taking all hands down with her.

Often the footropes and yards were covered with ice. If a sailor's fingers, numb with cold, fumbled and let go, he could pitch from the swaying footrope into the empty blackness below. If the ship were at that moment swinging out over the sea, he would drop like a cannonball and sink so deep that he could not hold his breath long enough to struggle back to the surface. Even if he did, there was little chance that the ship could come about and find him in the dark stormy waters. His cries would not be heard above the shrieking of the storm, but the sailor who fell into the sea and drowned died a less painful death than the one who plunged onto the deck. A fall like this was enough to break nearly every bone in a man's body, and the ship's surgeon could do little but try to comfort him through his hours of agony until he died. It was a very lucky sailor who happened to fall into a sail. If his comrades worked fast, they could haul him back onto the footrope, still alive but scared within an inch of his life.

for more than 50 years.

Sometimes it was just as dangerous on deck. In a pitching sea, one of the huge guns could break loose from the ropes that held it to the gun port at the ship's side. Each gun weighed hundreds of pounds and was set on wheels so it could be rolled back and forth at its port. When one broke loose and slewed around, the iron monster could roll the length or width of the deck, crushing anything in its way. The only way to stop it was to get a long iron bar under the gun and heave it over on its side. Only a brave man would try that on a slippery, rolling deck.

When the weather grew rough and cold, there was always the chance of being struck by a shipmate falling from above, and when the seas rose higher and the ship plunged her bow under the towering waves, the hissing green water poured aboard and swept the length of the deck. Any sailor who was not ready to grab hold of something could be picked up like a cork in this boarding sea and carried over the rail.

There were plenty of men aboard Nelson's ship who had not joined up willingly. If the Navy had waited for volunteers, it would never have been able to complete a crew for any of its warships. In those days, a man could be walking the streets of a port town like Chatham or Liverpool one minute and, the next thing he knew, wake up in a hammock aboard a ship—after being knocked unconscious and kidnapped by a 'press gang.' These press gangs were roving bands authorized to capture men for service as sailors...

It was a rough and rebellious crew that manned most ships of the British Navy in those days, and the officers used rough methods to keep them working. The seaman's 'on watch' usually started with the shriek of the boatswain's whistle and the bellow of the mate: 'All hands ahoy!' and 'Up all hammocks ahoy!' Every man moved fast; if he did not, the mate 'started' him with the flick of a knotted rope's end. When the work was not dangerous, it was long and dreary: scrubbing decks, tarring ropes, painting the ship's sides, shifting sail to make the most of every slant of wind.

For their labor, the men were paid what amounted to a few dollars a month, and they did not receive that until they were released, sometimes after years of service. The food was often spoiled and there was usually not enough of it. Many of the officers believed that the only thing that could make good seamen was the harshest form of discipline. Any sailor who moved too slowly or grumbled over the work or the food was 'corrected' by the whistling end of the knotted rope or the heavy end of a marlinspike. There were even Navy regulations against swearing. An ordinary seaman caught using profanity was forced to wear a heavy wooden collar and pace up and down the deck until he was ready to drop. One captain added two 32-pound shots to the collar and nearly broke the man's neck.

If a sailor made the mistake of talking back to a superior or falling asleep on watch, he received far sterner punishment. Taken below and chained, he was given a length of rope and ordered to make his own cat-o-nine-tails. Then he was taken on deck, because in the crowded quarters below decks there was 'not enough room to swing a cat.' On deck, the sailor was stripped to the waist.

His wrists were tied and hoisted. Then he was lashed with the cat he had made, until his back was a bloody pulp. The bleeding back was doused with salt water, partly to add to the punishment, but mostly to clean the wounds. Aboard British naval ships in the days when Nelson went to sea, this was an almost everyday occurrence.

Often the men rebelled, in hidden ways and in the dark of the night. An officer would fall down a companionway because someone had left a bucket on the steps. A marlinspike would drop from aloft and knock an unpopular mate unconscious. A 32-pound cannonball would roll the length of the deck, thundering down on an officer and crushing him against the rail if he did not jump quickly out of its path. Rarely were the seamen who tried such tricks of revenge found out. Woe to them when they were.

Some sailors who could not take the abuse and punishment tried to desert. It was not easy. Whenever a naval ship was in port or near land, a marine sentry was constantly on duty, patrolling the special 'marine walk' to watch for any attempted desertion. If a man did get away, he was hunted down by the Navy. If he was caught, his punishment was far worse than he had had before. A 'run man' was taken back to his ship and sometimes 'flogged through the fleet,' as an example to others who might be planning to jump ship, he was taken in a boat and flogged before every vessel in the fleet. His punishment was usually stopped before he died, and he was put back to work as soon as he could walk again.

With conditions like these—press gangs kidnapping the worst waterfront riff-raff and naval officers trying to beat them into submission—it was no wonder that there was sometimes open mutiny...

And yet it was the greatest Navy in the world. It was the Navy that beat France, the Navy that captured or sank all but one ship in the American Navy in the Revolutionary War. It was the Navy that made England a great power...that kept Napoleon from conquering most of the world.

How could England's sailors be so poorly treated, so rebellious and such good sailors, and fighters all at the same time? One good reason was Englishmen like Nelson... English sailors were great patriots. Every man was more than ready to die for his country. None could think of greater glory than bravery in battle for England. Even during the famous mutiny at Spithead, which happened while England was at war with France, the mutinous sailors announced that if the French Fleet should put to sea, the mutiny would be postponed.

A more important reason was that the British Navy was the first in the world to train its officers professionally instead of simply letting a wealthy or titled man, with no experience or training, purchase his officer's commission. British naval officers, schooled by harsh discipline, were proud of their competence, and this competence was recognized by their subordinates.

Most of the officers saw to it that discipline was maintained, but with fairness to all, and these officers won the affection as well as the respect of their men...¹²

Maritime combat in those days was—as on land during the

Napoleonic Wars¹³—a brutal, savage affair. For instance, Nelson's famed flagship, HMS **Victory** (still on view today at Portsmouth, England), launched in 1765 (making her 40 years old in 1805 at the time of Trafalgar), carried 104 cannons (some even in Nelson's own sleeping cabin!) that hurled balls in weight ranging from 12-68 pounds.¹⁴ The damage that these could—and **did**—do to men and wooden ships was fearful, indeed, as described by author Whipple:

"Bulkheads were . . . taken down, so that each deck was one clear space with no interrupting walls. Tables, chairs and all other movable objects were carried down to the hold or made ready to tow astern in boats during battle. This was because a cannonball could split a table or chair into huge flying splinters that could drive through a man like so many spears . . .¹⁵ sand . . . had been spread on the decks to keep them from getting slippery when covered with blood. On the gun decks, he studied the short caronades, the guns that were called 'smashers.' They were being loaded with round shot and musketballs, which would spray like gigantic buckshot across the enemy decks. Other guns would fire chain shot, which would whip around anything it hit. Others would fire fagot shot, pieces of iron that would slice enemy sails and cut away rigging . . . '32-pounders' could throw a great, 32-pound cannonball with enough force to drive it through a hull a mile and a half away. Around these guns stood the gunners, stripped to the waist and wearing handkerchiefs around their heads. When the firing started, they would slip the handkerchiefs over their ears so they would not be deafened by the roar . . .¹⁶ Others filled buckets and doused the decks, hammock nettings and sails to avoid fire . . . the men . . . noticed that the smooth water around the ship was cut by the fins of sharks, circling and waiting . . .¹⁷ The **Victory** rocked as her broadsides went off. Hundreds of pounds of iron, chain and musketballs screamed . . . and swept the length of the French ship. French guns were knocked over. Gunners were mown down. As the **Victory's** gunners raced to reload and fire again, they could hear the wild screams of the enemy wounded. Through their gunports, they could see the French lying in piles all over the deck; 300 men aboard the **Bucentaure** were killed in one broadside from the **Victory** . . .¹⁸

In addition to the above hazards of sea warfare, there was fierce hand-to-hand combat once enemy ships became entangled from rigging and wrought-iron grappling hooks designed especially for the purpose (and as seen in numerous Errol Flynn pirate movies of the 1930s.) Nelson, himself led several boarding parties (as we shall see), and the weapons used

during these ferocious *mélees* included dirks, daggers, officers' swords, cutlasses, pikes, pistols,

axes and the blunderbuss (a short, shotgun-like weapon with a wide muzzle.) From the riggings,

OUR ONLY BUSINESS

"EVERYTHING FOR THE WOODBURNING PUBLIC"

OUR PROFESSIONAL SALES STAFF
RALPH BAUMGARDNER, MARY MCGREGOR, PAUL WILLIAMS

Woodburning - Energy Independence for America

When you consider energy costs today, it's easy to understand why thousands of Maryland homeowners have turned to Fisher® Woodstoves. Fisher Stoves can save up to 75% on your heating bills and will burn 18 to 24 hours on one fueling of coal or wood. Fisher Stoves are firebrick lined, guaranteed for five years, virtually airtight, and have patented Spin Draft Air Controls. These features make Fisher the highest quality, American-made woodstove; the original, not a copy.

At **BAUMGARDNERS'**, you can choose from sixteen models and ten eye-pleasing colors of Fisher® Woodstoves in both stove and fireplace models. The new Fireplace Insert model can make your existing fireplace ten times more efficient. We can answer any questions you may have regarding heating with wood. Keep in mind that we also sell custom-fitted Glass Fireplace Doors, Chimney Systems, fireplace toolsets and more... everything you need for your fireplace or woodstove to warm and beautify your home.

Fisher® Stoves - An idea America is warming up to.

marines of the opposing vessels fired down onto enemy decks with long-barreled muskets (and it was to a French marine, as we shall also see, that Admiral Nelson ultimately fell victim.)

Military Medicine at Sea

The practitioners of military medicine of the period did what they could to deal with such wholesale bloody carnage as resulted from the battles described above. States author Whipple:

"And on the lowest (orlop) deck, the ship's surgeon and his helpers prepared their instruments for the bloody work they would have to do when the wounded were brought below. Alongside the surgeon's operating table stood large wooden tubs. These would measure the grisly price of heroism—in the numbers of arms and legs the surgeon would have to amputate...¹⁹ Nelson's secretary...walked up to make a report...and suddenly fell to the deck, cut almost in two by a shot. The marines quickly picked up the body and tossed it overboard before the blood made the deck dangerously slippery...²⁰ In the dim cockpit, there were the groans of the wounded, the cries of the young midshipmen unable to fight back tears, and the sudden piercing shriek of a man whose arm had to be cut off without any pain-killer except a gulp of rum...²¹

Author John Terraine, a

chronicler of the Battle of Trafalgar, has recorded some eyewitness accounts of the carnage:

"For the ordinary seaman, surgery was on a first-come, first-served basis..."

"Mr. Chivers, surgeon of the *Tennant*, told me a man who was working one of the quarter-deck guns was shot through the great toe; he looked at his toe, which hung by a fragment of skin, and then at his gun, and then at his toe again; at last he took out his pocket knife, gave it to his comrade and said, 'Jack, cut that bit of skin through for me.' 'No,' says the other, 'go down to the Doctor, man.' 'Damn it, I'm ashamed of going down to him for this trifle, just whip it off for me, it's only a bit of skin.' In this way, they were going on, when the carronade near him took a cant accidentally, from a roll of the ship, and crushed the whole of that part of his foot; he was then obliged to leave the deck, but is now on board, and doing well."

Another anecdote came from the captain of the *Leviathan*. Like many others of the wounded, including the Spanish Admiral Gravina, the sailor described in this letter later died from gangrene...a shot took off the arm of Thomas Main, when at his gun on the forecabin; his messmates kindly offered to assist him in going to the surgeon, but he bluntly said, 'I thank you, stay where you are; you will do more good there.' He then went down by himself to the cockpit. The surgeon (who respected him) would willingly have attended him in preference to others, whose wounds were less alarming, but Main would not admit of it, saying, 'Not until it comes to my turn, if you please.'

The surgeon soon after amputated the shattered part of the arm, near the shoulder; during which, with great composure, smiling, and with a steady clear voice, he sang the whole of 'Rule Britannia!'

Even when the wounded were taken below, they were not safe from further injury, as the following account makes clear. The writer of this letter was an Army officer serving aboard the French ship *Pluton*:

'A cannonball, penetrating the main gun deck, killed two men and wounded several others, including myself. I fell, bathed in the blood of myself and of the dead. I was unconscious for some time. When I came to, I recognized the voice of one of my soldiers, whom I asked to take me to the surgeon's post. He told me that he would already have done so, but had thought I was dead. I was wounded in three places. In the left eye, which I thought I had lost, but which has been open for four days now. In the left hand, which will be the longest to heal; and the one which has caused me the greatest pain was the blow I received on my weak chest, near the collar bone and from one shoulder to the other. It was swollen by four or five inches for five days.

After this, when I was stretched out on a mattress, I was again wounded in two places on my head by splinters thrown by a cannonball which passed through the orlop deck and which killed a surgeon—this shows the poor quality of our ship, even though it is new. What makes things worse was that at first I could not see, and later a dozen wounded fell on to my body, making me suffer considerably. They had to dress my wounds again.'"²²

Disease A Greater Foe Than Battle . . .

As with Napoleonic warfare on land,²³ "Even during wartime in the 18th Century, more sailors were killed by disease than by the enemy. Aboard a crowded, badly ventilated warship, the men suffered from rheumatism, pneumonia and tuberculosis. The worst killer aboard ship was scurvy, a disease caused by lack of fresh fruits and vegetables. British doctors had found that it could be cured by lime juice (which led to the slang name 'limey' for Englishmen.) . . . The most dreaded shipboard killers in these years, especially in the tropics, were the fevers—typhoid fever, yellow fever and malaria. There were no known cures, and about the only treatment was quinine, which lowered the stricken men's temperature, but did nothing to fight the disease itself. . . ."²⁴

Nelson's own, personal early experiences as a young midshipman led him to have a lifelong compassion for his sailors that later came to be called "the Nelson touch."²⁵ A strong believer in preventive medicine for his sailors, "Nelson tried to ease their life. He saw to it that fresh provisions were brought out . . . There were oranges and lemons to prevent scurvy. Nelson liked to remind the Admiralty that 'It is easier for an officer to keep men healthy than for a physician to cure them . . .' He even demanded flannel shirts with longer shirrtails, because the men had to lean over so far while out on the yardarms taking in sail during snowstorms . . ."²⁶

A Meteoric Career

"Nelson was born on Sept. 29, 1758, at Burnham Thorpe, in Norfolk, where his father, the Reverend Edmund Nelson, was rector. His mother died when he was nine. He was known as Horace by his 11 brothers and sisters. He grew up within sound of the sea, and is said to have learnt to sail on the local tidal creeks before he joined the Royal Navy in 1771 . . ."²⁷

" . . . his ship rolled gently through the brilliant blue waters of the Caribbean. He watched dazzling white islands rise out of the sea. He walked along pink beaches and listened to the wind sigh through palm trees and the water suck in and out of coral caves. He turned brown under the hot, dry sun of the West Indies . . . He tasted West Indian

rum, smelled tobacco drying and listened to the chatter of parakeets and the crooning song of the natives in the soft evening air. He came home to England a sun-bronzed, muscular young man . . ."²⁸

It is a tenet of Nelsonian lore that he possessed courage bordering on the foolhardy, which made itself apparent early in his career: "At 14, he went in the **Carcass** on a voyage to discover the North Pole. It was on this trip that he nearly lost his life to a polar bear which he was trying to capture single-handed in the dark, on the ice. His musket misfired and he escaped being mauled only by the firing of a gun of the **Carcass**."²⁹

Like his enemy and contemporary Napoleon . . . and, later, Erwin Rommel and George Patton—Nelson was absolutely fearless in battle and generally in the van of the thickest fray. Nor was he modest about his bravery, as this personal account of one such engagement reveals:

" . . . perhaps my personal courage was more conspicuous than at any other period of my life. In an attack of the Spanish gunboats, I was boarded in my barge with its common crew of 10 men, Cockswain, Captain Fremantle and myself, by the Commander of the gunboats. The Spanish barge rowed 26 oars, besides officers, 36 in the whole; this was a service hand-to-hand with swords, in which my Cockswain, John Sykes (now no more) twice saved my life; 18 of the Spaniards being killed and several wounded, we succeeded in taking their Commander."³⁰

Indeed, Nelson's propensity for personally leading boarding parties aboard enemy ships had him once using one opponent's vessel (already captured) to take a second,

leading one wit to call the device "Nelson's patent bridge for boarding first-rates."³¹

By the year 1801, he'd fought 105 naval battles (and called Copenhagen "The most terrible of all")³² and, in most of these—particularly in the major engagements such as the Nile—his fleet was heavily outnumbered by the enemy (as at Trafalgar, where the combined French/Spanish fleet numbered 40 vessels to his 34),³³ but his credo was—like Napoleon—always to attack first.³⁴ He would fight rather than not, and preferred being at sea to being idle.³⁵

A very religious man by nature, Nelson was, nonetheless, a believer in destiny. He was obsessed with the belief that he was destined to be England's greatest naval hero—and was, Custer-like, bent on achieving glory for himself, the Royal Navy and his country. As he once wrote to his mistress in the third person (a device later affected also by Gen. Douglas MacArthur, among others), "Nelson must stand among the first or he must fall."³⁶ Writes author Terraine, "Westminster Abbey was his objective,"³⁷ (although he was, in fact, buried at St. Paul's in a coffin fashioned from a mast of the enemy flagship at the Battle of the Nile.³⁸

His courage and his fatalistic view of death were rooted in his religious beliefs:

"When I lay me down to sleep, I recommend myself to the care of Almighty God, when I awake I give myself up to His direction, amidst all the evils that threaten me, I will look up to Him for help, and question not but that He will either avert them or turn them to my advantage, though I know neither the time nor the manner of

my death, I am not at all solicitous about it because I am sure that He knows them both, and that He will not fail to support and comfort me."

Such faith, combined with professionalism, ambition and a conviction of high destiny, was a battle-winning weapon."³⁹

Despite a lifelong tendency to disobey orders with which he did not agree (as we shall see),⁴⁰ Nelson was as popular with his superiors as with his junior officers (whom he called his "band of brothers"),⁴¹ and won rapid promotion: he was a Captain at 21, an Admiral at 39.⁴² So popular was he with his sailors that, once, "Nelson was presented with an extraordinary petition. If he was taking command of another ship, . . . his crew would gladly give up shore leave in order to transfer with him . . ."⁴³

The young officer was described in these early days of his career by Prince William Henry (his friend who, in 1830, as William IV, became King of England) as "The merest boy of a Captain I ever beheld, dressed in an antique, full-laced uniform, unpowdered, straw-colored hair and a pigtail a foot long."⁴⁴

Nelson's Love Life

During recuperation from scurvy at a hospital in Quebec, Canada in 1781, Nelson fell in love with a girl 16 years old, while he was 23, and nearly resigned from the Navy in order to marry her, but was talked out of his impulsiveness by his colleagues.⁴⁵ (This incident presaged his later reckless love affair with Emma Hamilton.) After some other brief encounters, Nelson met his then-widowed future wife, Frances Nisbet (nicknamed Fanny), and married her on March 11, 1787, at age 29.⁴⁶ He was faithful to her until he met the already-married Mrs. Hamilton during a recuperative shore leave at Naples in Italy in 1798 after the Battle of the Nile.⁴⁷ Their illegitimate daughter (and his only child), Horatia, was born in 1801.⁴⁸ The affair scandalized all Europe (leading King George III to snub Nelson and Emma at court.)⁴⁹ Fanny left him (but never gave Nelson a divorce)⁵⁰ and the Admiral remained passionately⁵¹ true to the fat⁵² Emma (who was also a heavy drinker⁵³) until his death.

Early Nelsonian Illnesses

The earliest known Nelsonian illness was his contraction of a fever (some feel it was malaria) during a voyage to Bombay, India in late 1775.⁵⁴ Writes A.B.C. Whipple of this incident:

"The fever, added to India's sweltering heat, quickly took the weight and muscle off the figure that had been so robust in the West Indies and the Arctic. Then came paralysis. The squadron's chief surgeon could do nothing; all he could recommend was that the patient be put aboard the first ship returning to England. That was the **Dolphin**, a new frigate with comfortable quarters that must have been welcome to the desperately sick young man. He was carried aboard, 'almost a skeleton,' as he remembered it later, and the **Dolphin** made ready to sail for England and home.

The voyage took six months. The cool air seemed to have no effect on the fever. Nelson wasted away even more, and few of those who were caring for him thought he could last much longer, but, with agonizing slowness, he began to grow a little better. The **Dolphin's** captain . . . took pity on the suffering midshipman and spent hours trying to cheer him up. Finally, as the **Dolphin** rounded the Cape of Good Hope and made her slow way into northern waters, the young midshipman started to recover.

Nelson's near-death in India had an effect that lasted throughout his life. Never again was he the sturdy, strong, muscular young man who had returned from the

West Indies and the Arctic. Always he would look short, slight and frail. Whenever he touched at tropical ports again, there was a recurrence of the old fever, but the experience had an even more profound effect on him mentally than physically. During the weary, six-month voyage home, he had more time for thinking than ever before. At first, when he was unable to throw off the gloom left by the fever, he 'almost wished myself overboard.'

Nelson's mental recovery finally came about in an odd way. One hot afternoon, as the *Dolphin's* sails slatted back and forth on an almost airless sea, the fallow-cheeked young man lay on his bunk and tried to think of his future. He might never be completely healthy again. He had been struck down in the prime of his youth, before he had even started the long climb of promotion in the Royal Navy. He could see nothing ahead but the bleak prospect of a sickly, useless life, but then, for no reason at all, as he described it later, the world and his outlook on it were transformed.

'A sudden glow of patriotism was kindled within me, and presented my King and Country as my patron,' he later wrote. As this emotion surged through him, the young midshipman made a vow that would shape the course of his life—and of England's history. 'Well then,' I exclaimed. 'I will be a hero... I will brave every danger.'⁵⁵

Back in England, Nelson was posted to another vessel in September, 1776, and was sent in 1780 on an infantry expedition against the Spanish in far-off Nicaragua in Central America, capturing Ft. San Juan, but suffered a recurrence of his fever that buried 180 of his 200 men⁵⁶ (although the numbers who died vary from one book to another in the Nelsonian literature.) He was forced to return to England, where he... was an invalid for some months.⁵⁷ His recall from Ft. San Juan by the Admiralty is credited with saving his life,⁵⁸ and the convalescent was well enough to return to sea by August, 1781,⁵⁹ but he'd had a difficult recovery, as he wrote on May 17th: "I have entirely lost the use of my left arm, and very near of my left leg and thigh, and am at present under the care of an emi-

nent surgeon in London, but he gives me hopes of a few weeks will move my disorder... When you write to my father, do not mention my complaints, for I know it will make him very uneasy..."⁶⁰

In October, 1782, he wrote that he'd put in at Quebec on Sept. 17th after a bout with scurvy... "having, for eight weeks, myself and all the officers lived upon salt beef; nor had the ship's company had a fresh meal since the 7th of April."⁶¹

During 1787-93, England was at peace, so Nelson wasn't needed by the Navy, but he returned to active duty in the year 1793, which marked his first clash with then-Colonel Bonaparte, a young artilleryman stationed at the French Channel port of Toulon, which Nelson's ship was helping bombard, while the following year witnessed his first serious wounding.

1794: Loss of Right Eye

British Dr. William Gooddy wrote in 1970, concerning Nelson's duties besieging the French-held city of Calvi, on Corsica (the island of Napoleon's birth):

"In 1794, we come to one of the three best-known of Nelson's disabilities, the damage to his vision. Though he is commonly supposed to have lost the sight only of his right eye, from direct injury, he may have had damage to both eyes, worse in the right than the left."⁶²

On Aug. 8th, he wrote Fanny: "...on the 10th of July last, a shot having struck our battery, the splinters of stones from it struck me most severely in the face and breast. Although the blow was so severe as to occasion a great flow of blood from my head, yet I most fortunately escaped by only having my right eye nearly deprived of its sight. It was cut down, but is as far recovered as to be able to distinguish light from darkness, but as to

all the purpose of its use, it is gone; however, the blemish is nothing, not to be perceived unless told. The pupil is nearly the size of the blue part, I don't know the name. At Bastia, I got a sharp cut in the back... You must not think that my hurt confines me. No—nothing but the loss of a limb should have kept me from my duty..."

Some evidence as to the nature of the eye injury is given in the medical certificate: 'Wound of the iris of the right eye, which has occasioned an unnatural dilatation of the pupil, and a material defect of sight.'

'Wounded in the face and right eye, much injured by stones or splinters, struck by shot from the enemy. There were several small lacerations about the face; and his eye so materially injured that in my opinion he will never recover the perfect use of it again.'

W. Chambers
Surgeon to the Forces
in the Mediterranean.

Though it is usually supposed that Nelson's sight was ruined by a foreign body, it is possible, on this evidence, that he had a detached retina, especially as little comment was ever made on the appearance of his right eye, and no traumatic changes are seen in his portraits. If there had been much derangement of the eye, it would have been likely to have been obvious. It is true that he often wore a green shade over his eye, but this was on account of pain. Later, the sight of his left eye became less good, and Nelson himself said in 1804: 'My eyesight fails me dreadfully: I firmly believe that in a very few years I shall be stone blind.'⁶⁴

1797: Battle of Cape St. Vincent and Loss of Right Arm

The year 1797 was a milestone in Nelson's career, for three main reasons: on Feb. 3rd, he was promoted Admiral,⁶⁵ on Valentine's Day (Feb. 14th), he disobeyed orders and thereby helped defeat the Spanish at the Battle of Cape St. Vincent⁶⁶ and, finally, lost his right arm on July 25th during an unsuccessful landing at Teneriffe in the

Spanish Canary Islands.⁶⁷

The night before the landing, Nelson had made out his will,⁶⁸ and tried to persuade his stepson, (by Fanny) not to go on the mission. Luckily for Nelson, as it turned out, the stepson insisted on going.⁶⁹

During the landing, everyone hit the beach and dashed for cover from the bullets and shells that were sweeping the water's edge.

Most of the shot covering the beach was grape—spraying volleys of musketballs that swept the area like buckshot. As Nelson stepped out of the boat and drew his sword, a shower of grapeshot struck him in the right elbow. The blow spun him around and knocked him to the ground. His first reaction was to grab with his good left hand for the sword that had fallen into the sand. It had belonged to his famous uncle, Capt. Suckling, and Nelson considered it a good-luck token, but he was unable to get back on his feet, and the gush of blood from his wound rapidly weakened him until he scarcely knew what was happening.

The men in his boat had plunged on across the beach, searching for shelter from the defenders' fire. Nelson might have lain there and bled to death if it had not been for his stepson. Josiah Nisbet quickly noticed that Nelson was not with those who had crossed the beach, and he returned, looking for him. He found Nelson, lying in a pool of blood near the boat. Calling for help, Josiah collected five men and lifted his stepfather back into the boat...

Josiah took a neckerchief and tied it

tightly around Nelson's arm just above the wound, slowing the flow of blood. The boat started away from the beach, pitching high over the breakers and out toward the ship.

At that point, the cutter **Fox**, which had left the ship at the same time as Nelson's boat, was struck and holed below the waterline. She started to sink, amid the screams of men floundering about in the storm-whipped water. As if at the sound of their cries, Nelson regained consciousness and sat up. Josiah was directing their course for the nearest ship, but Nelson looked across at the sinking **Fox** and ordered the rowers to go over and save the swimming sailors. Josiah argued with him, pointing out that if Nelson's bleeding were not tended by a doctor right away he might die. Nelson refused to listen. While he lay bleeding in the bottom of the boat, the oarsmen turned the boat and rowed over to the sinking cutter. It took almost half an hour to complete the rescue, but many of the **Fox's** men were saved.

By the time the boat reached Nelson's ship, the **Theseus**, the seas were running so high that it looked impossible for anyone to climb aboard. Someone heard the Admiral hail the ship and, realizing that he must be wounded, prepared to lower a chair from the main yardarm. Nelson called for a rope and shouted, 'Let me alone! I've got my legs left and one arm.' He grabbed the rope and hauled himself aboard ship. Then, he said, 'Tell the surgeon to get his instruments ready, for I know that I must lose my arm, and the sooner it is off the better.'

There was nothing to kill the pain of the operation, for anesthetics had not yet been discovered. While the ship's surgeon cut

through the flesh and what was left of the bone, Nelson could only close his eyes and grit his teeth. The surgeon worked fast, because he knew that his patient was weak from loss of blood and chilled by his long ride back to the ship from the beach. He cut off Nelson's right arm high above the elbow, tied off the blood vessels and hoped for the best.

The full shock of the injury did not strike Nelson until much later. Within 15 minutes of the operation, he was calling for his flag captain to ask how the battle was going...

The defeated fleet put out to sea and returned to its base. Then Nelson slowly began to realize how great a personal loss he had suffered. His report of the battle had to be written with his left hand, and it was all he could do to read his own writing. He could not dress himself, and his coat had to be sliced open so the stump of his right arm could fit through. His aides had to cut his food for him when he ate, but, most of all, he suffered from the never-ending pain. He could still feel the breath-taking agony of the cold steel knife. Nelson's wound healed slowly, and one of the ligatures that had tied off a blood vessel would not come loose. All day and night the wound throbbed. Finally he had no choice but to return to England for recuperation.... He had been at sea more than four years....⁷⁰

When Nelson, lying in the sand, recognized Josiah Nisbet, he stated, "I am a dead man,"⁷¹ but, as we have seen, he revived sufficiently to

clamber aboard the **Theseus**. The ship's surgeon noted in his medical journal: "1797 July 25. Admiral Nelson. Compound fracture of right arm by musketball passing through a little above the elbow, an artery divided: the arm was immediately amputated and opium afterwards given.' Four days later, 'The stump looked well. No bad symptoms whatever occurred. The sore reduced to the size of a shilling. In perfect health. One of the ligatures did not come away.'"⁷²

States author Tom Pocock, "Nelson bore the agony with courage, but the shock of the cold knife was such that he ordered his surgeons henceforth to heat amputation instruments. He was resilient and, next day, the surgeon recorded that he had 'rested pretty well and quite easy.' Tea, soup and sago. Lemonade and Tamarind drink." ⁷³

Author Oliver Warner (one of whose ancestors later examined Nelson's stump),⁷⁴ states that the surgeon who did the amputation was "Thomas Eshelby, who had the help of Louis Remonier, a royalist refugee from Toulon."⁷⁵ (Both Nelson's first left-handwritten letter⁷⁶ and the amputation saw⁷⁷ have been preserved, as has his special "three-tined fork, to which the blade of a knife has been affixed"⁷⁸—and which enabled him later to eat his food with his remaining hand—plus the ball that killed him in 1805⁷⁹ and a death-mask cast afterwards.)⁸⁰

Of the amputation, another source states:

"He did the usual circular amputation at the site of election through the middle third of the arm just below the deltoid insertion where the median nerve crosses the brachial artery. The latter vessel was undoubtedly severed at the time of the injury. The soft tissues must have been very forcibly retracted from the humerus as the ultimate

stump was much shorter than one would expect from the above anatomical description of the site of amputation. Only two ligatures were applied. These were silk and left long, with the ends hanging out of the wound.

After the operation, Nelson was given Pil. Opii grs. ii, and that was repeated during the day and nightly afterwards for some weeks."⁸¹

A Difficult Recovery

The Admiral's initial reaction to his amputation was acute depression, and he even thought of retiring from the Navy. His first letter following the incident was on July 27th (a mere two days later!) to his commanding officer, Sir John Jervis: "I am become a burden to my friends, and useless to my country... When I leave your command, I become dead to the world; I go hence, and am no more seen... I hope you will be able to give me a frigate, to convey the remains of my carcass to England..."⁸² On Aug. 16th, he wrote again: "A left-handed Admiral will never again be considered as useful, therefore the sooner I get to a very humble cottage the better, and make room for a better man to serve the state..."⁸³ and "...a hut to put my mutilated carcass in."⁸⁴

He arrived at Spithead in England in this self-pitying mood on Sept. 1, 1797, where he was acclaimed both in the press and by the public. The stump, however, was **not** healing properly, as recounted by Dr. Gooddy:

"The stump of his arm remained very painful, so that he had to take opium each night. The main cause of the pain was a ligature which had not separated from the wound. The practice of the time was to seal off the blood vessels by tying waxed threads (or silk) round them, leaving the long ends loosely emerging through the stump itself. Eventually, the ligatures were withdrawn by pulling them through the wound and there was the dreadful business of pulling on the ligatures when the wound was dressed, to see if they were yet free or not. This proce-

dures brought with it the risk of secondary hemorrhage, and, naturally enough, from the hazards of amputation done in a few minutes, almost in the dark, in a rolling ship, ligatures must have been inexactly placed, including tissues other than arteries or veins. It seems almost certain that a main nerve of the arm was ligated, either with an artery or separately.

Nelson had a phantom limb, as almost all amputees do; but there are not many allusions to it. He is supposed to have believed in the immortality of the soul because of the persistence of the limb's presence. A letter from his brother states:

'I did this day meet... a surgeon, and esteemed a good one. I mentioned particularly the apparent pain in your right hand. He said it was a sure sign of a nerve being taken up with the artery, indeed he says it is hardly possible to avoid it as there are so many and such small ones: that you must now have patience and all will do well, but he thinks the ligature had better not be forced too much; he thinks you are very safe with Cruikshanks (William Cruikshanks, d. 1800), who certainly is very eminent.'

Nelson's wound was not healing properly and was giving him more pain rather than less as the days went by. The Nelsons therefore went to London, to see if specialists there might be more helpful than the sea physicians of Bath...

I now quote from Oman again:

'At the Admiralty, Nelson learnt, amongst other things, the very welcome news that he was to get a pension of 1,000 a year. Custom decreed that he must first make a formal statement of his services to his sovereign. The document, when accomplished, was impressive. He could claim to have assisted at four fleet actions, three with frigates, six engagements against batteries, 10 cutting-out expeditions, and the capture of three towns, in which service, humbly submitted for His Majesty's consideration, he had lost his right eye and arm.'

There was a standard procedure for uniforms after loss of an arm. The sleeve of the coat was slit to allow an assistant to insert the painful stump into the sleeve, the slit being secured with three bows of black or blue ribbon. All portraits of Nelson showing these bows belong to the four-months period before the stump healed.

Because of the pain, the failure of the wound to heal, and the retention of the ligature, the possibility of reamputation or 'cutting down on the nervebulk' was discussed. The wound became hot and swollen, and was poulticed. Thomas Keate, Surgeon-General to the Army and Surgeon to the

Prince of Wales, was called in, and advised against 'violent methods.'

On Dec. 3, 1797:

'Nelson went to bed as usual. Outside, the streets were quiet, for it was Sunday night, and there had been three days of intermittent snow. What was unusual was that he slept the night through, waking almost free of pain. He had returned to a sane world, nothing resembling the distorted scene through which he had been forcing his way, almost a soul dragging a corpse, from the moment when he had felt himself hit in the right elbow. The reason might easily be guessed, and when the surgeon (hastily summoned) undid the bandages, the ligature came away at the slightest touch. The knotted thread, attended by evil odors, fell into the dressing like a spent snake, to trouble no more. Within a few days, his stump was fast healing...' ⁸⁵

He returned to sea duty on March 29, 1798.⁸⁶ "...Nelson had some difficulty in settling into his new ship. His luggage was badly packed; he lived at first in great discomfort, and he soon realized the handicap which wounds brought with them. He left England in less high spirits than when he arrived, and it was clear that his servant, Tom Allen, had much to learn if he wished to make his master comfortable."⁸⁷

When he returned to Britain on Nov. 6, 1800, he was even able to joke about the missing limb. A land-lord asked permission to rename his inn **The Nelson Arms**, to which the Admiral replied: "That would be absurd, seeing that I have but one!"⁸⁸

1798: Battle of the Nile (Aboukir Bay) and Head Wound

On Aug. 1, 1798, Nelson at length tracked down Napoleon's fleet to Aboukir Bay off Alexandria, where Gen. Bonaparte had begun his famed Egyptian expedition. The Admiral failed to capture the French commander himself (which would have thus ended Napoleon's career 17 years before Waterloo!), but he came very close. In any event, he defeated the French fleet at the Battle of the Nile, Britain's greatest naval victory since 1588. French Adm. Francis De Brueys was killed ("De Brueys, his legs shot away, had tourniquets tied to the stumps and had himself seated in an armchair on deck until a cannon shot tore him in half")^{88a} and his flagship, **Orient**, blew up,

while "Nelson estimated that 1,400 Frenchmen were killed and 600 wounded; 218 British died and 677 were wounded. More than 3,000 French...were taken prisoner, most of whom Nelson sent ashore so Napoleon's forces in Egypt could care for the wounded. Of the 13 French ships of the line, nine had surrendered and two had burned. Only two had managed to slip out...carrying French Rear Adm. Pierre Villeneuve..."⁸⁹ (whom Nelson would oppose again, at Trafalgar, seven years later.)

As for Nelson, himself during the battle, "...he was 'working his fin,—twitching and stump of his right arm—and angrily giving orders..."⁹⁰

"He was standing on the quarterdeck of the **Vanguard**...when he was hit.

Among the types of ammunition used by gun crews in those days was langridge, a bundle of jagged scrap metal which flew through the air like so many knives when fired from a ship's cannon. It was particularly useful for cutting up sails and rigging, and the French were employing it to good effect. It was a piece of langridge which caught Nelson in the head.

The metal struck him on the forehead and cut through to the bone. Blood poured down his face and chest. The torn flesh fell over his good eye and blinded him. He fell to the deck, but was quickly caught up in the arms of Capt. (Edward) Berry, who summoned help to carry him...deep in the ship below the waterline, the surgeon was at work tending the more than 70 men who had been wounded. Immediately, he turned his attention to the Admiral, but Nelson refused. 'No,' he said, 'I will take my turn...'

When the surgeon finally got to Nelson, he announced happily that the injury was nothing more than a deep flesh wound. The good eye did not seem to be affected, but both eyes had to be covered up by the bandage. The blindfolded Admiral was then led to a cot in the room where the ship's bread was stored, and told to rest.

Nelson promptly called for his secretary, to dictate the news of the victory which he could now send to England. The secretary, who had been wounded himself, took one look at the pale, bandaged Admiral and became so flustered that he could not take down the message. Nelson called for another aide. The new one found that the Admiral had pushed the bandage up off his good eye and was himself scrawling with his left hand: 'Almighty God has blessed His Majesty's arms in the late battle...' ⁹¹

Oliver Warner reports that "The wound temporarily blinded him altogether, and seemed at first so grave that he thought he was dying... Nelson later wrote that, but for his own wound...not

a French ship would have escaped...he was still suffering from the concussion..."⁹² Author Hattersley states that the wound was "...three inches long"⁹³ and that the surgeon's name was Dr. Jefferson.⁹⁴ Nelson arrived at Naples, in Italy, on Sept. 22, 1798 "...with a head which was 'splitting.'" ⁹⁵ "It was more than a year before Nelson recovered fully...and returned to England."⁹⁶

1801: Battle of Copenhagen—"I Have Only One Eye..."

On Apr. 2, 1801, Nelson attacked the Danish fleet, anchored off the port of Copenhagen (the name of Wellington's horse at Waterloo⁹⁷), as well as that city's shore batteries, and won yet another victory. There occurred during the thick of the fighting the most famous incident in all of Nelsonian lore: the blind eye caper (as portrayed on this month's cover). The Admiral's superior—thinking success was beyond British means—signalled Nelson to break off the combat and withdraw.

"Nelson, in the **Elephant**, said to his Captain, Foley: 'You know, Foley, I have only one eye. I have a right to be blind sometimes.' He is said to have raised his spyglass to his right eye, the one injured at Calvi, and announced that he could not see the signal to leave off action. Curiously enough, there was serving in this battle...in the **Glatton**, Capt. (later Adm.) William Bligh, well-known for his association with the **Bounty**, and less well-known, unfortunately, for his having been the master of Capt. Cook's third voyage in 1776."⁹⁸

During the cold, icy voyage to Copenhagen, "One after another, the men came down with colds and pneumonia. Half the crew was sick by the time...the fleet anchored..."⁹⁹—but, reportedly, no one had died. During the battle, however, "More than 250 British had been killed and nearly 700 wounded...the Danes...paid a higher price...nearly 800 killed...900 wounded...2,000 taken prisoner..."¹⁰⁰ Upon returning to England, Nelson's "...first act...was to call at the hospital at Yarmouth, to visit the men who'd been wounded at Copenhagen."¹⁰¹

Interlude, 1801-5

England was at peace until war was declared again on May 18,

1803, when at 4 AM, Nelson left his country estate at Merton to report back for sea duty.¹⁰² Until the Battle of Trafalgar, more than two years later, the Admiral's forces shadowed Napoleon's fleet to prevent the long-dreaded French invasion of the British Isles. "His remaining eye began to grow dim from the strain of the hours on deck... the **Victory's** doctors tried to make him wear a green eyeshade, but it was little help..."¹⁰³

As Whipple reports,

"Then came a wild and agonizing race through Atlantic storms and frustrating calms. By the time the combined French/Spanish fleet reached the French West Indian island of Martinique, nearly 1,000 crewmen had to be sent ashore for hospitalization. Another 1,000 died before Villeneuve was ready to start back to Europe. In contrast, Nelson lost not a single man during the entire chase..."

Nelson ordered the course set eastward, and on July 20, 1805, the British fleet dropped anchor at Gibraltar and Nelson went ashore to see if there were news of the Combined Fleet. It was the first time he had set foot off the **Victory** in two years...

Nelson was exhausted. He was weak and sick from too much tension and too little sleep. He knew that he had probably saved the British West Indies, but that was not enough. He was utterly discouraged by the two years he had spent trying to catch Vil-

leneuve and make him fight. Nelson took the **Victory** into Portsmouth for a much-needed overhaul. He was rowed ashore in his barge. He made his courtesy call on the commander of the port. Then, in a pouring rain, he climbed into a carriage and set out for home. All night, cramped in the carriage and trying to sleep on the hard, bouncy seat, he rode through the dark to Merton. It was 6 AM, and a gray and cheerless dawn, when he arrived...

At Merton, Nelson could sleep as late as he wanted, while away the lazy hours wandering about the grounds of the estate and forget all the cares of the war at sea, but he was unable to make such a complete change. He still rose in the morning before dawn, and he spent most of his time pacing back and forth at the summerhouse he called 'the poop.' As he paced, he made his plans for attacking the Combined Fleet...

He was wasted and thin from his long service in the Mediterranean. His unseeing right eye and the green shade over the other made it difficult for him to see, and he had to walk slowly and with great care, sometimes stumbling over a curb or barely missing a lamppost. Still, he walked as erect as any officer in the Royal Navy, and one clerk at the Admiralty noticed that in the courtyard Nelson strode straight across the difficult cobblestones to the doorway instead of following the smoother path. In fact, the clerk said, this was what told him right away that the newcomer must be Nelson himself."¹⁰⁴

1805: Battle of Trafalgar— and Death

News came that the Combined

French/Spanish Fleet had been discovered leaving the Spanish port of Cadiz to meet Nelson's in battle.

"The news that Villeneuve 'had come out' reawoke in Nelson all the old prophetic premonitions of death. He discounted the possibility of losing a leg, but contemplated the prospect of losing his life. He would, he announced over dinner, prefer to be buried in St. Paul's rather than Westminster Abbey. The Abbey's foundations lay in marshy ground and his body would soon rot. In the drier soil of St. Paul's, it would last forever."¹⁰⁵

He was right, for the Battle of Trafalgar, Oct. 21, 1805, was to be his last—and his greatest victory. Simply stated, "Nelson was killed by a bullet which traversed his shoulder, lung, pulmonary artery and spinal cord."¹⁰⁶ As stated earlier, the bullet was fired by a French marine from the rigging of the ship **Redoutable**, which was locked in combat with Nelson's flagship, the **Victory**.

There are several detailed accounts of the fatal wounding. States Author Pocock:

"Nelson and Hardy paced, side by side, on the quarterdeck, concealed from the enemy only by gunsmoke. For half an hour, they had walked thus, when, at their usual

Cardinal Yacht Charters invites you to cruise the Caribbean in a manner that suits your style. Choose from the brand new Morgan Out Island 41 with its three cabin/two head layout, crewed or bareboat, or the popular Out Island 33 for smaller parties or a family of six. Cardinal has a charter cruise to fit any requirement such as **scuba** diving qualifications from basic to instructor. Scheduled and

escorted **Down Island** cruises to the Leeward Islands and our **Basic Cruising Course** for first time charterers. And of course the favored **Do It Yourself Bareboat**. Don't be left out of the fun this season... Cruise the Caribbean **The Cardinal Way!** Total yacht ownership with potential-substantial tax benefits on sale/lease back sailboat plan available.

turning point, Hardy noticed Nelson was not beside him, turned and saw the Admiral on his knees, the fingers of his left hand touching the deck. Then he slipped on to his side. "They have done for me at last, Hardy. My backbone is shot through."

As Nelson was carried below to the surgeon on the orlop deck, he covered his face with his handkerchief so that he would not be recognized. Once below, his clothes were cut off him and Surgeon Beatty quickly saw that nothing could save his life.

A musketball from a French sniper, fired from above, had penetrated Nelson's shoulder and chest and lodged in his spine. Pain and internal bleeding convinced Nelson that he was dying fast. "Remember me to Lady Hamilton! Remember me to Horatia!" He then became calmer and said he would live another half hour. While Beatty and his assistants brought cooling drinks, fanned his face and rubbed his chest to ease the pain, Nelson could hear cheers from the gun decks above, as enemy ships struck their colors, and the whole ship jarred at each broadside.

Hardy visited him with the news that victory was complete and that at least 15 of the enemy had surrendered. "That is well," Nelson muttered, "but I had bargained for 20." He then reminded Hardy to anchor after the battle, and renewed his pleas for the care of Emma. He asked Hardy to kiss him farewell. "Now I am satisfied," he said. "Thank God I have done my duty."

To the Chaplain, he now said, "Doctor, I have not been a great sinner." And "Re-

member, I leave Lady Hamilton and my daughter Horatia as a legacy to my country, and never forget Horatia." (Ed. note—previously, he'd not admitted his paternity of Horatia by Emma Hamilton.—BT.)

As he sank into unconsciousness, he would mutter, "Fan, fan" and "Rub, rub," then was silent. At half-past four on Oct. 21, 1805, nearly three hours after he had been hit, Nelson died.¹⁰⁷

Says Oliver Warner:

"Nelson was carried below to the cockpit by Sgt. Seeker and two seamen. 'They have done for me at last,' he said to his Flag-Captain. 'I hope not,' said Hardy, remembering Nelson's wound at the Nile, which he had thought at first to be mortal. 'Yes,' answered the Admiral, 'my backbone is shot through.' He lived for several hours more, but in great pain, and with the certainty that nothing could be done to save him. Even the conduct of the battle was out of his hands. It was every captain for himself; but Nelson knew well enough he could rely on their success."¹⁰⁸

Dr. Gooddy writes in more strictly medical detail of the wound:

"Penetrating wound of the left shoulder; fracture of two left upper ribs; penetration of left lung; division of branch of left pulmonary artery; fractures of sixth and

seventh dorsal vertebrae; contusion of the spinal cord; Metallic foreign body retained..."

Nelson was carried below to the Surgeon's quarters, which were painted all in red. "It was like a butcher's shambles," said the Rev. Dr. Scott, who stayed with Nelson 'till he died.

Though there have been numerous accounts of the death of Nelson, none has equalled the description of one of the chief eyewitnesses, Dr. William Beatty. He wrote, in 1807, "The Authentic Narrative of the Death of Lord Nelson." This work contains perhaps the best illustration of the fatal bullet, together with the cloth of the uniform and some of the gold bullion of the epaulette which it penetrated.

Dr. Beatty took a history, asking his patient to give him a full account of the occurrence, with all his sensations. Nelson answered that he had no sensation in the lower part of his body, and that he felt 'a gush of blood' every minute within his breast. Respiration was short and difficult, and he felt very acute pain about that part of the spine which he thought had been struck by the ball. 'I felt it break my back,' he said, but his pain was not due to an external injury to the back as was at that time supposed (until Beatty's examination had shown no superficial wound in the back). It was later shown that the bullet had passed into the chest through the left epaulette. In its course, it broke two ribs and severed a main branch of the left pulmonary artery. It then passed on to fracture the sixth and seventh dorsal vertebrae, before ending in the paravertebral muscles. Nelson was complaining of mid-dorsal root pain, from spinal cord damage at that level. The effect of the bullet upon the spine was to cause a transection of the cord. Nelson, therefore, had, and complained of, mid-dorsal root pain, combined with total motor and sensory paraplegia. It was because of spinal cord damage that he had subsided to the deck after wounding. It must be considered a most dramatic symptom of pulmonary artery damage for the patient to describe the gushing of blood within his chest. This severe hemorrhage caused great pallor, a barely perceptible pulse and air hunger. Nelson complained also of great thirst, and was constantly plied with lemonade. A small fan was constructed from paper, and used to fan Nelson in the cramped and crowded lower deck.

The Surgeon already knew, from 'the gush of blood' which his Lordship complained of, together with the state of his pulse, the hopeless situation of his patient.

Nelson kept repeating 'fan, fan,' and 'drink, drink.' This he continued to repeat when he wished for drink or the refreshment of cool air, till a very few minutes before he expired. Lemonade, and wine and water, were given to him occasionally. Mr. Burke told him: 'The enemy were decisively defeated, and that he hoped his Lordship would still live to be himself the bearer of the joyful tidings to his country.'

He replied: 'It is nonsense, Mr. Burke, to suppose that I can live: my sufferings are great, but they will soon be over...'

His Lordship now requested the Surgeon, who had been previously absent a short time attending Mr. Rivers (a midshipman who lost a leg), to return to the

"THE DEATH OF NELSON," from a painting by A. W. Devis, depicts the dying Admiral below decks of his flagship, HMS *Victory*, surrounded by physicians and other officers. His bemedalled uniform jacket—which attracted the fatal rifle-fire of the French marines—lies crumpled at his feet.

wounded and give his assistance to such of them as he could be useful to, 'for', said he, 'you can do nothing for me.'

After the Surgeon had been absent a few minutes, he was called by Dr. Scott to his Lordship, who said: 'Ah, Mr. Beatty! I have sent for you to say, what I forgot to tell you before, that all power of motion and feeling below my breast are gone: and you,' continued he, 'very well know that I can live but a short time.'

The emphatic manner in which he pronounced these last words left no doubt in the Surgeon's mind that he adverted to the case of a man who had some months before received a mortal injury of the spine on board the **Victory**, and had labored under similar privations of sense and muscular motion. The case had made a great impression on Lord Nelson; and he was anxious to know the cause of such symptoms, which was accordingly explained to him and he now appeared to apply the situation and fate of this man to himself.

The Surgeon answered: 'My Lord, you told me so before,' but he now examined the extremities, to ascertain the fact, when his Lordship said: 'Ah, Beatty! I am too certain of it; Scott and Burke have tried it already. You know I am gone.'

The Surgeon replied: 'My Lord, unhappily for our country, nothing can be done for you.' Having made this declaration, he was so much affected that he turned round and withdrew a few steps to conceal his emotion.

His Lordship said: 'I know it. I feel something rising in my breast,' putting his hand on his left side, 'which tells me I am gone.'

Drink was recommended liberally, and Dr. Scott and Mr. Burke fanned him with paper. He often exclaimed: 'God be praised, I have done my duty'; and upon the Surgeon's enquiring whether his pain was still very great, he declared it continued so very severe, that he wished he was dead. 'Yet,' said he in a lower voice, 'one would like to live a little longer, too.'

Capt. Hardy now came to the cockpit to see his Lordship a second time. Lord Nelson and Capt. Hardy shook hands again and while the Capt. retained his Lordship's hand, he congratulated him, even in the arms of death, on his brilliant victory.

He then told Capt. Hardy, he 'felt that in a few minutes he should be no more,' adding in a low tone: 'Don't throw me overboard, Hardy.'

The Captain answered: 'Oh no, certainly not...!'

Lord Nelson died at half-past four in the afternoon, about three hours after the fatal wound was received...¹⁰⁹

Author Terraine points out (in an excellent schematic cutaway diagram of the **Victory**) that Nelson died in the Midshipmen's Berth¹¹⁰ (where, ironically, he'd begun his naval career.)

Whipple relates how, prior to the shooting,

"As Nelson stood watching them, Dr. Beatty approached Capt. Hardy, the **Victory's** Master. Dr. Beatty was worried about

Nelson's safety. The Admiral was wearing the uniform coat he had worn ever since coming aboard the **Victory**. The coat had embroidered decorations on its left breast, and Beatty thought they made too good a target. There were sure to be sharpshooters in the enemy's tops. Beatty asked Hardy if the Admiral shouldn't be asked to change his coat for one that would attract less attention. Hardy answered that he did not think the Admiral would like being told to change his coat, even for a reason like this, but he promised that he would mention it if he got a chance'¹¹¹ Characteristically, Nelson refused.¹¹²

Another such characteristic action, adds Whipple, also helped kill the Admiral; he ordered his own protective squad of British marines, when the enemy fire became intense, to disperse. "Later, the marines could have helped protect him from the sharpshooters in the enemy tops."¹¹³

While Nelson lay, "...drowning in his own blood" (from the punctured lung),¹¹⁴ his marines helped avenge his wounding. As one of them recalled later, in reference to the French marines, "I remained firing till there was not a man to be seen in the top."¹¹⁵

And that was not all. French Rear Adm. Charles Magon was

killed,¹¹⁶ as were "4,530 sailors and nine ships' captains." The wounded numbered 3,573, among them Rear Adms. Cisneros, Alava and Gravina and 10 ships' captains. Villeneuve was captured, together with several hundreds of the men who served under him. By comparison, British casualties were light—449 men killed and 1,214 wounded. The death toll throughout Nelson's entire fleet was less than the tally of dead in the **Redoutable** alone."¹¹⁷

The Combined Fleet surrendered 18 ships, while the British lost none.¹¹⁸

Epilogue

Nelson's demise soured the news in England of his great victory. "'When Nelson died,' wrote the poet Coleridge, 'it seemed as if no man was a stranger to another: for all were made acquaintance in the rights of common anguish.'"¹¹⁹ His body was taken to Gibraltar and then to England, where his funeral procession left Greenwich Hospital Jan. 8, 1806 (more than **two months** after his death!) to float down the Thames River in London.¹²⁰

The final irony of his career occurred almost a full decade later, in 1815. Napoleon, defeated at last, was carried to his final exile on the island of St. Helena aboard the British warship **Bellerophon**—which had been under Lord Nelson's command at Trafalgar.

a SmithKline company

IT'S HIGHLY RECOMMENDED... AND FOR GOOD REASONS

Polymyxin B

Neomycin

Bacitracin

Gram-negative
Pseudomonas
Hemophilus
Klebsiella
Aerobacter
Escherichia
Proteus
Gram-positive
Corynebacterium
Staphylococcus
Streptococcus
Pneumococcus

1. provides broad-spectrum, overlapping antibacterial effectiveness against common susceptible pathogens, including staph and strep
2. helps prevent topical infections, and treats those that have already started
3. it's good medicine for abrasions, lacerations, open wounds, primary pyodermas, secondarily infected dermatoses; and it's painless and cosmetically pleasing
4. contains three antibiotics that are rarely used systemically, so the risk of sensitization is minimal
5. you can recommend it in any of the three convenient package sizes: 1 oz tube, 1/2 oz tube, or the versatile, single-use foil packet

NEOSPORIN® Ointment

(polymyxin B-bacitracin-neomycin)

selected
by NASA for
the Apollo and
Skylab missions

Each gram contains: Aerosporin® (Polymyxin B Sulfate) 5,000 units, bacitracin zinc 400 units, neomycin sulfate 5 mg (equivalent to 3.5 mg neomycin base); special white petrolatum qs; in tubes of 1 oz and 1/2 oz and 1/32 oz (approx.) foil packets.

WARNING: Because of the potential hazard of nephrotoxicity and ototoxicity due to neomycin, care should be exercised when using this product in treating extensive burns, trophic ulceration and other extensive conditions where absorption of neomycin is possible. In burns where more than 20 percent of the body surface is affected, especially if the patient has impaired renal function or is receiving other aminoglycoside antibiotics concurrently, not more than one application a day is recommended.

When using neomycin-containing products to control secondary infection in the chronic dermatoses, it should be borne in mind that the skin is more liable to become sensitized to many substances, including neomycin. The manifestation of sensitization to neomycin is usually a low grade reddening with swelling, dry scaling and itching; it may be manifest simply as a failure to heal. During long-term use of neomycin-containing products, periodic examination for such signs is advisable and the patient should be told to discontinue the product if they are observed. These symptoms regress quickly on withdrawing the medication. Neomycin-containing applications should be avoided for that patient thereafter.

PRECAUTIONS: As with other antibacterial preparations,

prolonged use may result in overgrowth of nonsusceptible organisms, including fungi. Appropriate measures should be taken if this occurs.

ADVERSE REACTIONS: Neomycin is a not uncommon cutaneous sensitizer. Articles in the current literature indicate an increase in the prevalence of persons allergic to neomycin. Ototoxicity and nephrotoxicity have been reported (see Warning section).

Do Reindeer Really Fly?

By RICHARD F. CIOFFI, MD and JOLLY OLD ST. NICK, PhD

From the Department of Aerospace Medicine, North Pole Hospital and Medical School.

Introduction

For a number of years, there has been a great deal of controversy regarding the possibility of the reindeer's ability to fly. Some¹⁻² believe that reindeer indeed **can** fly. Direct observation, as well as circumstantial evidence, such as hoof prints in strange places, appears to indicate that at certain times during the winter season, reindeer, usually in groups, have been known to pull a vehicle through the sky and have been known to land on rooftops. Others, however,³ have denied that this is possible and have argued to the contrary, sometimes bitterly.

Because of this controversy, a study was undertaken to determine whether reindeer indeed **can** fly. The purpose of this paper is to present the results of such a study.

Materials and Methods

Seventeen male Canadian reindeer ranging in age from seven to nine years and weighing between 300 and 500 kg. were studied. All were kept in my backyard and attended to by children ranging in ages from three to 11 years. These reindeer were arbitrarily separated into three groups. Group One consisted of eight reindeer maintained on a diet of candy canes and sugar plums. Group Two consisted of eight reindeer fed a standard reindeer chow. Group Three consisted of one reindeer younger than the rest who had the dubious distinction of having a red nose.

Each reindeer, singly, or in a group, was brought to the top of my garage roof and either voluntarily or forcibly jumped from the roof. In another study, the reindeer were paired in groups of two, four, and eight, with and without harnesses and, on more than one

occasion, a sled-like vehicle was attached to the harness. In a separate set of experiments, the reindeer from Group Three was placed at the lead of each group of eight. One of the authors (SC) guided the sled-like vehicle at various times during the study period and would further add weight and stability to the team. On occasion, words such as "Ho, ho!" were uttered by the author arbitrarily.

Results

All the reindeer from Group Two demonstrated an inability to maintain themselves in a flying position either singly or in mixed groups. This was especially likely to occur when the group was harnessed together. During the study period, the reindeer from Group Three, who was asked to lead this team, became so disgusted at their inability to fly that his nose ceased glowing. Even my coauthor became so depressed at their inability to fly

that he was heard to mutter such phrases as "Oh, hell, Christmas will never come."

On the contrary, each reindeer in Group One demonstrated a unique ability to fly. Left on their own, each reindeer was able to fly approximately 12 miles and land gingerly again on top of the roof of my house. There was a strange predilection to land as close to the chimney as possible and this cannot be explained. When the reindeer were paired in groups of two, four, six and, finally, eight, not only flight time but flight distance was increased. Furthermore, their landing pattern was quite unique in that they would land in unison and quite smoothly on the roof. At no time did any reindeer slip or tend to veer from his designated course. When all eight reindeer were together, and when leading the sled-like vehicle with the coauthor in control, a distance of some 120 miles was covered during one flight. Indeed, during one of the night flights in the midst of a dense fog, the reindeer from Group Three demonstrated the uncanny ability to lead the group up to 240 miles. When this had been ac-

complished, my coauthor was heard to exclaim a phrase which ended "...and to all a good night!"

Conclusion

This study demonstrates that under the right set of circumstances, there is a group of reindeer that has clearly demonstrated the ability to fly for rather long distances and, further, has demonstrated the ability to pull a sled-like vehicle with a passenger. For reasons not entirely explained, the reindeer had to be fed a special diet and, further, demonstrated the uncanny tendency to land as close to a chimney as possible; however, it was further apparent during this study that a certain combination of reindeer had to fly together in order to achieve the most distance. For example, a reindeer by the name of Dasher had to fly next to a reindeer named Dancer, so also Cupid and Comet and Donner and Blitzen had to fly in pairs. Another unanswered question is why the single reindeer in Group Three, while rejected by the other reindeer at ground level, seemed to be accepted by the group as leader when he flew in the lead position.

Other unanswered questions from the study are what's to be done with 20 pounds of deer dung and what to do with the 17 scrawny reindeer that are still in my back yard?

Drinking and Driving in Maryland: A Special Report, 1979

By CAROL BENNER, BA; DEL. TORREY C. BROWN, MD and R ADAMS COWLEY, MD

Ms. Benner is affiliated with the Maryland Institute for Emergency Medical Services Systems of the University of Maryland, 22 S. Greene St., Balto., MD 21201, where she can be contacted for reprint and other data. Dr. Brown is Associate Professor of Medicine at the Johns Hopkins University School of Medicine and is a member of the Maryland House of Delegates in the State Legislature. Dr. Cowley is Director of MIEMSS.

ABSTRACT

Drinking alcohol and driving is a critical problem in Maryland. One half of all traffic fatalities, serious injury highway accidents and unknown numbers of minor accidents and traffic violations are directly attributable to drinking and driving. Driving is a privilege granted to the citizen by the State. As a condition of maintaining the privilege, the driver must abide by certain conditions legislated and enforced by the State. A major dilemma in Maryland has been how to identify the drinking driver, rehabilitate him/her and ultimately make the highways as safe as possible.

This paper examines the problem in Maryland. Basic principles of blood alcohol content and risk of accident, serious injury and death due to vehicular cause are presented with pertinent Maryland data. A description of the present law is provided with discussion of the strengths and weaknesses. A final section discusses the alternatives and the salient issues that the State needs to address.

Blood Alcohol Content (BAC)

The Blood Alcohol Content (BAC) is the universal legal standard for determining intoxication. It is defined as the percentage (weight by volume) of ethyl alcohol in the blood. Various factors affect the BAC and include a) the number and strength of drinks consumed, b) the interval of drinking, c) the amount of food consumed and d) body weight. Because of the variability of these factors and the variability of the metabolism of alcohol in individuals, it is not possible to compare amounts of alcohol consumed when discussing effects of impairment or intoxication.

For example, a 200-pound person will metabolize alcohol quicker than a 150-pound person; an "old topper" or experienced drinker will metabolize alcohol quicker than the uninitiated or inexperienced drinker.

There is, however, only a very small difference in the response of individuals to a given level of alcohol circulating in the blood. Muehlberger states that "All men with the same blood alcohol level (BAC) are approximately equally intoxicated within an error plus or minus of 10 or 15%."¹ Thus, even though it may take significantly different amounts of alcohol to reach a BAC of .10%, all persons at this level are about equally affected.

Table 1 indicates approximate amounts of alcohol for individuals at two different body weights needed to attain specific blood alcohol levels.²⁻⁴

The BAC and Risk of Accident, Serious Injury and Death on the Highway

The physiological effects of alcohol on the body are well documented. Alcohol is a depressant and causes decrease of inhibitions, lack of muscular coordination, resistance to stimuli, confusion, slurring speech, staggering and so forth.

Sufficient dysfunction to impede careful operation of an automobile occurs at the .10% blood alcohol level. If, at a BAC of 0.0% the risk factor is one, the probability of crash increases four times at .08%, seven times at .10%, 25 times at .15%, 60 times at .18% and 100 times at .20%.⁵⁻⁶

Actual data that demonstrates the correlation between BAC and death or serious injury due to vehicular accident is more striking. The Maryland State Medical Examiner's Office reports that in 1977, 693 persons died on Maryland highways. Of the 509 pedestrians and drivers, 319 (63%) had detectable alcohol levels with the average well above .10%. A special unreleased report shows that 80% of the drivers who were considered at-fault had been drinking.⁷

Information concerning BAC and serious injury accident is also available. The Maryland Institute for Emergency Medical Services (Shock Trauma Unit) is a specialty referral unit for seriously injured victims. The Institute provides information concerning blood alcohol levels on 598 automobile accident victims admitted in 1977 and 1978 (See Table 2). Comparison of the MIEMSS population to a national roadside survey of all drivers⁵ shows a gross over-representation in the high BAC classification: 39% of admissions above .10% compared to up to 2.0% of all drivers and 24% above .15% compared to 1.0%. The average BAC of the victims was .144%.⁸ (In a national roadside survey, drivers are randomly stopped and examined for blood alcohol content. During the daytime hours, about 10% of all drivers have been drinking; in the evening and nighttime hours, about 20% of all drivers have been drinking.)

Thus, it appears that the available Maryland data confirms national statistics: that alcohol is contributory to serious injury accidents and highway related death, and the majority of these tragedies occur at a BAC of .10% and higher.

Table 1:
Approximate Blood Alcohol as a Function of Body Weight and Alcohol Consumed

Body Weight	Number of Drinks* To Reach .10%	Number of Drinks To Reach .15%
120 lbs.	3	5
150 lbs.	4.5	6.5
180 lbs.	6	8

*One drink is equivalent to one 12-ounce beer, one five ounce glass of wine or one and one-half ounce of 86 proof distilled spirits.

The Maryland Law for Drinking and Driving

In 1969, the Maryland General Assembly changed the drinking and driving laws to include 1) an express consent statute relating to the chemical test for alcohol content, and 2) a two-step system for prosecuting offenders for driving while under the influence of alcohol.

The express consent provision is consistent with laws in other states. The Transportation Article (MD Transp. Code Ann. § 16.205.1) attempts to insure that a chemical test (breath or blood) is administered to an individual if he/she is detained by a police officer for suspicion of operating or attempting to operate an automobile while under the influence of alcohol. As a condition of receiving a license to drive, the individual must sign a pledge consenting to the test if requested. Notwithstanding this pledge, however, the individual cannot be compelled to take the test; however, refusal can lead to loss of driving privileges for a period of up to 60 days.

Although refusal to take the test cannot lead to an inference of guilt or innocence, results from the test are admissible as evidence, **Schmerber v. CA, 384 US 757 (1966); Major v. MD, 31 MD App. 590 (1976)**. At a BAC between .05% and .10%, no presumption of intoxication or impairment can be made. At a blood alcohol level of .10% and above, there is evidence of impairment; and at .15% and above, there is prima facie evidence of intoxication (MD Cts. and Jud. Proc. Code Ann. §§ 10.302 to 10.309).

The second provision of the law (MD Transp. Code Ann. §§ 21-902) provides a two-standard system for prosecution: a) driving while intoxicated at .15% and above, and b) driving while impaired at .10% and above; 48 other states have a single standard system for driving while intoxicated at a minimum of .10% blood alcohol level. (New Jersey changed its statute in 1977 to .10%. Mississippi has a statute similar to Maryland. Utah and Idaho have driving while intoxicated levels at .08%). It is interesting to note that the US Department of Transportation recommends a driving while intoxicated statute at .10% BAC.⁶

The law carries both judicial and administrative sanctions. The judicial penalties include jail terms and fines; the administrative sanctions are imposed after a hearing by the Motor Vehicle Administration (MVA) and include suspension or revocation of the privilege to

drive.

One conviction of driving while intoxicated or three convictions in three years for driving while impaired can lead to revocation (formal termination of a person's license to drive). One conviction for driving while impaired can lead to a 60-day suspension (temporary withdrawal of the driver's license) and two convictions for driving while impaired in three years can lead to a 120-day suspension (MD Transp. Code Ann. § 16.205).

There are other recommendations that either the Court or MVA can suggest. These are primarily concerned with rehabilitation and education of the drinking driver and include referral to a driver's rehabilitation clinic, alcohol education program or to the MVA's Medical Advisory Board. These final sanctions are not exclusive of the administrative sanctions and can be imposed simultaneously with them.

With the inception of the chemical test for alcohol content in 1969, the numbers of arrests and convictions for drinking and driving increased dramatically.⁹ No doubt both the police and judicial system felt the strong and powerful effect of the blood alcohol test as supportive and conclusive evidence; however, review of police statistics demonstrates the complexity and difficulty with the express consent statute. The MVA licenses about two million drivers in Maryland. The Maryland city, county and state police forces arrested about 13,000 persons for driving under the influence of alcohol in 1977 and in 1978 or approximately six drivers per thousand. In 1973, the Alcohol Safety Action Program, a Federally-funded safe driving effort, reported six drinking and driving arrests per thousand drivers in the Baltimore area with some areas of the country as high as 35 per thousand.¹⁰ Thus, although there may have been an immediate impact of the new law felt in 1970, the arrest rate has remained low when compared to other areas of the nation.

Furthermore, of the 13,000 persons arrested for driving under the influence, 39% refused to take the chemical test. (See Table 3.) Although this group is subject to license suspension, the probability of conviction for driving while intoxicated or impaired is lessened without the presumptive or prima facie evidence.

It has been suggested that some drinking drivers refuse to take the test as a ploy to avoid conviction. Refusal cannot be used as evidence against the defendant, nor can it count as an alcohol related vehicle of-

Table 2:
Comparison of Blood Alcohol Content in Serious Injury Accident Victims in MIEMSS Population (1977-78)
to the Blood Alcohol Content in a National Roadside Survey of the Total Driving Population

	Negative	.001-.049%	.050-.099%	.100-.149%	≥.150%

Total Driving Population	80%-90%	5%-10%	5%	2%	up to 1.0%

Table 3:
Blood Alcohol Content in Persons Arrested for Driving Under the Influence in 1977-78

	Number Arrested	Refused Test	.001-.049%	.050-.099%	.100-.149%	≥.150%
1977	13,223 (100%)	5031 (38%)	424 (3%)	398 (3%)	1370 (10%)	5781 (44%)
1978	13,129 (100%)	4976 (38%)	362 (3%)	400 (3%)	1307 (10%)	5860 (45%)

fense. (Refusal with administrative sanction, is however, noted on the driving record).

Even so, the use of the PBJ (probation before judgment) rather than an explicit finding of guilt or innocence is common. (A PBJ is a disposition by the court. The PBJ carries an implication, of guilt, but is **not** a guilty finding. The number of PBJs in Maryland is unknown.) A frequent condition of the PBJ is successful completion of an alcohol rehabilitation program. This allows the offender to maintain his driving license while resolving his drinking problem. Again, the ambivalence of judges and/or prosecutors emerges concerning suspension or revocation, the ultimate consequence of conviction. Unfortunately, there has been no effective evaluation of the rehabilitation efforts to indicate success or failure. A national study of community alcohol related programs indicated that, in fact, the programs may have no deterring effect for future violations and may cause adverse effects.¹¹ Evaluation of the programs is difficult because offenders undergoing rehabilitation usually keep their licenses, whereas convicted persons usually have their licenses suspended.

When discussing the Maryland law, a question always arises concerning the leniency of penalty compared to other states. If consideration is given to the .10% conviction and subsequent sanction, the following is observed:

1) About 60% of the states have at least a minimum license suspension for 30 days at the .10% level. Some of the states have a minimum one-year revocation.

2) About 30% of the states have a minimum sanction of license suspension, but will substitute a restricted or limited license if appropriate.

3) Only four states (Maryland, Mississippi, Nevada, Washington) have no minimum sanction.

4) The maximum penalty in Maryland at the .15% level (revocation) seems to compare equivocally with the maximum penalties of other states at the .10% (in most states, suspension from six months to revocation).¹²

Analysis of enforcement of laws is another matter. Numbers of convictions for driving while intoxicated or driving while impaired are unknown in Maryland, much less in other states. It is difficult to compare effectiveness and outcomes of laws without these data.

Alternatives, Conclusion

Alternatives that have been suggested for Maryland include 1) mandatory administration sanctions for driving while impaired or intoxicated, and 2) lowering the limits of BAC from .10% and .15% to .08% and .10% for driving while impaired and driving while intoxicated. The mandatory penalties remove discretionary power from the judicial system, and the lowering of legal limits changes the Maryland law from what superficially appears to be very liberal to very strict. Both alternatives have met with opposition in the Maryland General Assembly (HB 747, 1979; SB 74, 1979). A more effective attempt may be to eliminate the two standard system and adopt the .10% BAC limit for driving while intoxicated similar to 46 other states.

A third alternative takes a different approach and targets the offender who refuses to take the chemical test and hence provide conclusive evidence for prosecution. This solution suggests increasing the time of

license suspension for refusal to take the test. It is interesting to note that the California statute (CA Veh. Code § 13353 (West)) suspends licenses for six months for refusal to take the test¹³ and the New York statute (NY Veh. and Traf. Law § 1194 (McKinney)) revokes licenses for a similar offense.¹⁴ (Both of these laws include hearings if requested by the offender before a motor vehicle administration.) The rationale behind this suggests that police officers will identify more drinking drivers if the presumptive or prima facie evidence is available for possible conviction.

In summary, it seems that, in Maryland, there is substantial evidence to support the presence of a drinking and driving problem, but insufficient evidence to evaluate the present legal process. Four salient issues need to be addressed in the state:

1) The lower number of arrests for driving under the influence as compared to other states;

2) The high proportion of persons who refuse to take the blood alcohol test when requested;

3) The high legal limit for driving while intoxicated (.15%) compared to recommendations by the Department of Transportation (.10%) and

4) The effectiveness of rehabilitation measures.

More importantly, the issue of whether the drunken driver should or should not be taken off the highway needs to be resolved. Then an effective system of identification of offenders can be developed and rehabilitative programs and the enforcement of laws can be active programs in this state.

Acknowledgments

I thank the following for their support and assistance: State Sen. Rosalie S. Abrams and Del. Joseph Owens from the Maryland Legislature, William Clark from the Maryland State Police, Judge Robert Sweeney from the Maryland District Court, Dennis Evans from the State Highway Coordinating Committee, Dr. Geoffrey Gibson and Dr. Carl Schramm from the Johns Hopkins University School of Hygiene and Public Health, Ms. Marianna Herschel and Dr. Roy Myers from the Maryland Institute for Emergency Medical Services System and Ms. Dottie McCaleb and Ms. Yvonne Summers for their technical assistance.

Medical Miscellany

A Note From the Telephone Co....

Most people at one time or another have taken a First Aid course, but, to paraphrase the late Vince Lombardi, "...Everyone can use a little more instruction in the basics."

To help with the "basics" in saving a person's life, residents of Baltimore can now turn to their **Yellow Pages** directories. Contained in the front of the new directory is an eight-page Emergency Medical Guide, prepared as a public service by the C and P Telephone Co. of Maryland in cooperation with the Maryland Institute for Emergency Medical Services.

The guide begins with instructions on how to call for professional

help and how to check for breathing. Subsequent information is arranged alphabetically according to the type of medical emergency.

Some of the topics covered include allergic reactions, amputations, poisoning, burns, broken bones, drowning, electric shock and seizures.

C and P is the second Bell System company to carry medical information in a directory. Pacific Telephone was the first, with a section in its San Francisco directory.

While the guide is not intended to take the place of formal training or professional assistance, it does provide concise information about the "basics" of First Aid.

Psychiatric Admission

Effective July 1, 1979, all private psychiatric hospitals in Maryland are approved for Blue Cross 30 days psychiatric admission on an 80% coverage. □

Endometrial Extension of Cervical Tumor: A New Technique for Definitive Detection

By HERBERT L. KOTZ, MD

Dr. Kotz is from the Department of Obstetrics and Gynecology of the Division of Gynecologic Oncology of the George Washington University School of Medicine at Wash., DC. Contact him for reprint and other data at Suite 303, 10215 Fernwood Rd., Bethesda, MD 20034.

Abstract

A new technique is described which permits accurate information on the presence or absence of endometrial extension from cervical cancer. The clinical importance of the technique is noted.

Introduction

While endometrial extension of cervical cancer is well recognized,¹⁻³ such cases are included under current FIGO staging as a cervical primary.⁴⁻⁵ A recent paper by Perez, et al⁶ revealed a poorer prognosis as well as a significantly greater incidence of distant metastases in patients with Stage 1 and 2 cervical cancer with endometrial extension. Because of their findings, these authors suggested a modification of therapy may be indicated when endometrial extension has been proven.

Perez, et al⁶ described the difficulty in accurately identifying those cases in which extension occurred and the problems involved in separating these cases from those where the curettings may have been contaminated by the cervical tumor.

They had to separate their cases into four categories: 1) Definite endometrial extension (24 cases—8%). Endometrial stroma and glands were present in the curettings and there was clear evidence of invasion of endometrial stroma by tumor cells. 2) Tumor only (32 cases—10.6%). The curettings contained only epidermoid carcinoma and its supporting stroma. No endometrial glands were present. 3) Admixture of carcinoma and endometrium (46 cases—15.2%). The curettings showed fragments of tumor, with or without supporting stroma, scattered among other fragments of endometrial glands and stroma. No actual tumor invasion of the endometrial fragments could be demonstrated. 4) Negative D and C (200 cases 66.6%).

Since a significant difference in absolute five-year cure rate in Stage 1 between those with proven endometrial extension (50%) and those with negative D and Cs (85%) was found, it would seem that a diagnostic method capable of placing the 25.8% of patients in the second and third categories (inconclusive as to endometrial involvement) would be of value.

The difficulty in accurate determination of endometrial extension from cervical tumors has been well described in the article by Perez, et al.⁶ It is very difficult for the surgeon to be certain that the uterine curettings are not contaminated by the cervical cancer, particularly if there is a significant endocervical component. If it is difficult for the surgeon, the determination of the source of the malignant curettings is **impossible** for the pathologist unless there is clear invasion of the endometrial glands and stroma by the tumor.

The purpose of this communication is to present a simple technique that will accurately identify endometrial extension.

Technique

After cervical biopsies have been obtained and an endocervical curettage performed (if indicated), a small graduated (four or six mm.) plastic, smooth-tipped curette (Vacutage, Warner Chilcott) is introduced into the endometrial cavity, the depth of which is noted. The curette is then attached to suction and curettage of the fundus performed without withdrawing the opening of the curette to the level of the cervix. The suction apparatus is then separated from the cannula and its contents sent for pathologic examination. The cannula is then removed.

Comments

This technique avoids contamination of the curettage specimen with cervical and endocervical tumor making it possible to include almost all patients with Stage 1 and 2 cervical cancers in one of two categories—those with and those without endometrial extension. A third indeterminate category (25.8% in Perez et al's series) is thereby avoided. If additional studies substantiate the clinical significance of endometrial extension, then the use of the technique herein described will permit not only the exact delineation of extent of disease, but a more accurate application of optimum therapy.

A Family Cluster of Tuberculosis

By J.P.G. FLYNN, MD, MPH; C. R. LAYTON, JR., MD and W. H. MITCHELL, BA

Dr. Flynn is Chief of the Division of Respiratory Diseases and Patient Care Consultant in the Administration for Services to the Chronically-Ill and Aged of the State of Maryland Department of Health and Mental Hygiene at 201 W. Preston St., Balto., MD, 21201, where he can be contacted for reprint and other data. Dr. Layton is Chief of Pulmonary Medicine at Peninsula General Hospital, Salisbury, MD, while Mr. Mitchell is Public Health Advisor of the Division of Respiratory Diseases of the Administration for Services to the Chronically-Ill and Aged of the State of Maryland Department of Health and Mental Hygiene.

A 27-year-old white male presented to a community hospital in rural Maryland in June, 1978 with right upper and right mid-chest pain.

His illness started approximately six weeks earlier with symptoms of easy fatigueability, minimal cough, productive of yellowish sputum and increasing shortness of breath with normal exertion. His weight decreased from 150 to 137 pounds.

Pertinent clinical findings were a pale, asthenic male, with soft, non-tender quarter centimeter lymph nodes palpable bilaterally in the anterior cervical chain. Late inspiratory crackles were detected over the right upper chest and the supra-scapular region. Blood pressure was 100/60 and was 20/20 vision.

Sputum smears were positive for acid fast organisms on four occasions. He was initially treated with INH 300 mgs. a day, Ethambutol 15 milligrams per kilogram, and Streptomycin one gram a day intramuscularly. The use of Streptomycin was to insure close contact and supervision of the patient during the first three months of therapy.

Following eight weeks of therapy, his sputum was free of acid-fast organisms; however, cultures sent in September were still found to be positive and did not clear until December, 1978.

In September, Streptomycin was discontinued and Rifampin at 600 milligrams a day started.

Contact investigation was initiated immediately after the case was identified. His 22-year-old wife was found to have a positive PPD, and an elliptical 15 by 15 millimeter-shaped density in the periphery of the right upper lung field. She had a cough of five days' duration productive of greenish sputum. Her smear was negative for acid-fast organisms. She was started on INH 300 milligrams and Ethambutol 15 milligrams per kilogram daily.

Cultures obtained at this time grew out *Mycobacterium tuberculosis*.

Their eight month-old son had been admitted to a community hospital three months previously with a history of a cough, poor fluid intake, tachypnea, vomiting and loose stools, and was found to have a right-sided broncho-pneumonia that cleared with Ampicillin.

When evaluated on the same day as his mother, he was found to have a cough of five days, and diminished nutritional intake. PPD (Mantoux Test) carried out more than 72 hours previously showed no reaction.

Chest X-ray showed right hilar adenopathy and alveolar infiltrates in both lung fields.

Despite the findings of the negative tuberculin test, the family history and clinical findings combined with the chest X-ray pointed directly to a diagnosis of pulmonary tuberculosis in the infant.

He was admitted to a hospital in Baltimore and underwent extensive evaluation that included a negative tracheal aspiration and lumbar puncture.

Repeated tuberculin skin tests were negative. He was started on INH 35 milligrams b.i.d. Streptomycin 140 milligrams injected into the anterior compartment of his thigh by tuberculin syringe and PAS 300 milligrams t.i.d. orally. The patient was subsequently discharged after making excellent progress and gaining 12 ounces during a two-week period. Following discharge, a gastric aspirate grew out *Mycobacterium tuberculosis*.

Ninety persons were identified as contacts in the community or workplace, and after careful tuberculin testing, only nine were found to be positive.

The clinical and epidemiological situations described here raise a number of important points that are worthwhile discussing in more detail.

1) While tuberculosis is predominately a disease of older persons, it is not confined exclusively to any one age group.¹

2) Household contacts to smear positive TB cases are at high risk of infection and development of disease.² Non-household contacts are at a lower risk, particularly to smear negative cases. Priorities for conducting the evaluation of contacts are well-established;³ they are often not adhered to, because of the anxiety TB still provokes within a community.

3) Negative tuberculin tests have been demonstrated in the presence of TB Disease in the past⁴ and, therefore, it is important to obtain a chest X-ray as well as performing a Mantoux Test when close contacts are identified.⁴

4) The major emphasis in TB control is to establish a diagnosis as rapidly as possible, initiate appropriate therapy and insure contact investigation is carried out. The outcome of these efforts are not always as satisfactory as one would desire. Particular attention must be paid to the social needs of the patient and family.

Anxiety still exists concerning the use of INH preventive therapy; however, reports from a number of sources indicate side effects can be prevented with careful patient selection appropriate monitoring,⁶⁻⁷ and protection from TB disease is again confirmed.⁸

The following is a list in order of priority of individuals that should be considered for Isoniazid preventive therapy.

1. Close contacts of a case of TB, particularly smear positive TB cases, (irrespective of tuberculin status).
2. Persons with positive tuberculin tests with ab-

normal chest X-ray findings consistent with non-progressive TB lesions. It is important to exclude bacteriologically positive disease and a prior course of adequate therapy in these persons.

3. Newly infected persons, particularly recent converters, i.e., those that have increased their tuberculin reaction by six millimeters of induration from under 10 millimeters to cover 10 millimeters of induration within a two-year period.

4. Individuals with positive tuberculin skin tests with associated special clinical situations. Particular attention should be paid to those on prolonged therapy with adreno-corticosteroids, immunosuppressive therapy and such conditions as Hodgkins Disease and other reticuloendothelial diseases, silicosis, diabetes mellitus and persons with a history of gastrectomy.

5. Other positive skin test reactors. The risk of TB is highest in infancy, high again in adolescence and early adult life and continues at a lower rate for life time.⁹

Individuals over the age of 35 years should not be considered for INH preventive therapy unless one of the first four risk factors enumerated above are present, notwithstanding the fact that the individual is at lifelong risk of developing TB; however, the risk of hepatitis after the age of 35 is greater and INH should not be used routinely in this group.⁹

At the present moment, the only effective drug we use in preventive therapy is INH (Isoniazid). The standard adult dose is 300 milligrams orally in a single tablet daily. For children, a dose of 10 milligrams per kilogram up to a total of 300 milligrams a day is recommended. The duration of therapy is 12 months.⁹

Therapy should be individualized, carefully reviewed and evaluated by the health care delivery team. It should be stressed to persons that they are embarking on a course of preventive therapy, and they should be part of the decision-making process. From the moment of initial contact with the health care delivery team, the respective recipient must be made to feel at ease, be motivated and encouraged to question each therapeutic step. It is most important to rule out bacteriologically positive or progressive TB disease, prior adequate course of the drug and contraindications to the administration of INH preventive therapy, such as INH-associated liver disease, severe adverse reactions to INH and acute liver disease.⁹

Preventive therapy is not contraindicated, but special attention is indicated by the following:

- a) concurrent use of any other medication on a long-term basis, to exclude drug interaction,
- b) use of diphenylhydantoin (this may have to be reduced to avoid toxicity),
- c) daily use of alcohol which may be associated with a higher incidence of INH hepatitis,
- d) prior use of INH which was discontinued because of side effects,
- e) possibility of current chronic liver disease,
- f) the pregnant patient.⁹

In the latter individual, it is prudent to prescribe only therapeutically necessary medications during pregnancy. It is worthwhile emphasizing that the increased risk of developing TB for a new mother is

during the post-partum period.⁹

It is most important to have a system for maintaining records and for monitoring and motivating the patient. Only one month's supply of drug should be provided to the patient at a time. The patient should be aware of and encouraged to communicate any untoward effects or any apprehensions they may have while taking INH.⁹

The Division of Respiratory Diseases in the State of Maryland Department of Health and Mental Hygiene developed a uniform document for use throughout the State to screen patients prior to initiation of preventive therapy and monitor at monthly intervals for adverse reactions and side-effects. Analysis of data generated from the standard chemoprophylaxis record indicates an increase since 1972 in the number of individuals taking Isoniazid for preventive therapy; however, there is still concern that infected persons at greatest risk are not starting on preventive therapy and those who are starting may be discontinuing the drug prematurely. On an encouraging note, it should be emphasized that in recent years in Maryland there were fewer individuals with serious liver problems compared to that observed in other study populations.¹⁰

Medical Miscellany

Annual Prize in Honor of Dr. Wendell Muncie

The Maryland Association of Private Practicing Psychiatrists and The Maryland Psychiatric Society jointly announce a contest for the awarding of a \$300 Prize, which will be made to the author who submits the best paper pertaining to a psychiatric subject. Eligible to enter are physicians who reside or practice within the bounds of the Maryland District Branch of The American Psychiatric Association, (i.e., all of Maryland except Prince George's and Montgomery Counties), who, as of the deadline for submission of the paper, are no more than 10 years beyond graduation from medical school, have completed at least one year of an approved psychiatric residency and are currently active in the profession of psychiatry.

The subject matter is broadly any topic pertaining to psychiatry or allied fields, and may be of clinical, research, theoretical or other aspects of the subject. The paper must be unpublished and there are no restrictions as to length.

All manuscripts must be received by Dec. 15, 1979. They should be mailed to Douglas A. Puryear, MD, Committee Chairperson, The Wendell Muncie Annual Prize Award, 1204 Maryland Ave., Balto., MD 21201.

The winner will be asked to read the paper personally at the joint meeting of the two societies scheduled for March 6, 1980.

1980 Achievement Award Competition

The American Psychiatric Association Hospital and Community Psychiatry Service advises that each year the Achievement Awards Board of the American Psychiatric Association solicits applications for awards by psychiatric programs of original quality or exceptional merit. With the support of the District Branches, the winners are selected annually. Appropriately-incrased plaques are awarded to the winners at the APA Institute on Hospital and Community Psychiatry.

While national recognition goes to the winners, psychiatry in general also benefits. New ideas and techniques are publicized, shared and retested under other conditions until many of them become standard practice.

The Board has always been concerned that some project of great potential value may be missed because no application is made. We are therefore appealing to every District Branch and to every State Mental Health Director to encourage worthy applicants from their areas. Any legitimate program benefiting the mentally-ill or retarded is eligible, whether it is based in a school, clinic or the community.

A special section of the October, 1979 issue of Hospital and Community Psychiatry is devoted to the 1980 award winning programs, and it is hoped you will be stimulated to think about new programs and develop-

ments in your local mental health facilities and be able to persuade them to enter the 1980 competition.

Applications must be postmarked before January 15, 1980. Applications and instructions for entering the 1980 competition are available through the Maryland Psychiatric Society's office at (301) 752-8292.

AMA Publishes New Register

Over 2,600 practice opportunities for physicians are listed in the August, 1979 edition of the **Opportunity Placement Register** published quarterly by the American Medical Association Physician's Placement Service.

A new "Placement Resources" section has been added with this register, says Leanne P. Irish, Director of the Placement Service.

This new section will list the many formal and informal organizations involved in regular and recurring physician recruitment activities, such as state medical societies, medical specialty societies, State and Federal government organizations, hospital and clinic management corporations, HMOs, large medical facilities and others.

The AMA's Physicians' Placement Service has been working since 1947 to assist physicians in locating new professional positions. The new quarterly placement register has increased the Placement Service's capability to assist the medical community and thereby improve accessibility of health care in the US.

For a copy of the current **Opportunity Placement Register** and registration information, write to: Physicians' Placement Service, AMA, 535 Dearborn St., Chicago, IL 60610.

Physicians from the People's Republic of China Tour Franklin Square Hospital

An eight-member delegation of physicians from the People's Republic of China toured Franklin Square Hospital recently as part of a 20-day visit to the United States in which they will exchange scientific knowledge of the diseases of the elderly.

William Reichel, MD, President of the American Geriatrics Society and Chairman of the Department of Family Practice at Franklin Square, and **Sanford Kotzen**, Executive Director and **D. Thomas Crawford**, MD, Director of Medical Education, hosted the visitors at Franklin Square, the only community hospital the study group will tour.

Presentations were made by **Gerald Glowacki**, MD, Chairman of the Department of Obstetrics and Gynecology; **Kenneth Lewis**, MD, Chairman of the Department of Medicine; Dr. Reichel, Chairman of the Department of Family Practice and **Philip Ferris**, MD, Chairman of the Department of Surgery.

The delegation was invited by the American Geriatric Society, the Gerontological Society and the American Psychiatric Association.

At Franklin Square, the Chinese leaders in gerontology met with the Clinical Chiefs and toured the various laboratories, the Intensive Care Unit, Coronary Care Unit, the Anesthesiology Department, the Psychiatric Unit, Surgical Suites and the Nursery.

They also toured the Dietary Department and Plant Engineering, areas in which they have a great interest. □

In therapy of skin and skin structure infections
due to susceptible strains of staphylococci and/or streptococci...

THE FIRST ORAL CEPHALOSPORIN THAT WORKS NIGHT AND DAY ON A SINGLE DOSE

DURICEF[®]

(CEFADROXIL MONOHYDRATE)

DURICEF®

(CEFADROXIL MONOHYDRATE)

References:

1. Data on file, Mead Johnson Pharmaceutical Division.
2. Gatley MS: To be taken as directed. *J Roy Coll Gen Pract* 16:39, 1968.

DESCRIPTION: DURICEF® (cefadroxil monohydrate) is a semisynthetic cephalosporin antibiotic intended for oral administration. It is a white to yellowish-white crystalline powder. It is soluble in water and it is acid-stable. It is chemically designated as 7-[(D-2-amino-2-(4-hydroxyphenyl)acetyl)amino]-3-methyl-8-oxo-5-thia-1-azabicyclo [4.2.0]oct-2-ene-2-carboxylic acid monohydrate. It has the following structural formula:

Clinical Pharmacology—DURICEF (cefadroxil monohydrate) is rapidly absorbed after oral administration. Following single doses of 500 and 1000 mg., average peak serum concentrations were approximately 16 and 28 mcg./ml., respectively. Measurable levels were present 12 hours after administration. Over 90 percent of the drug is excreted unchanged in the urine within eight hours. Peak urine concentrations are approximately 1800 mcg./ml. during the period following a single 500 mg. oral dose. Increases in dosage generally produce a proportionate increase in DURICEF urinary concentration. The urine antibiotic concentration, following a 1 gm. dose, was maintained well above the MIC of susceptible urinary pathogens for 20 to 22 hours.

MICROBIOLOGY: *In vitro* tests demonstrate that the cephalosporins are bactericidal because of their inhibition of cell-wall synthesis. DURICEF is active against the following organisms *in vitro*:

Beta-hemolytic streptococci
Staphylococci, including coagulase-positive, coagulase-negative, and penicillinase-producing strains
Streptococcus (Diplococcus) pneumoniae
Escherichia coli
Proteus mirabilis
Klebsiella species

Note—Most strains of *Enterococci* (*Streptococcus faecalis* and *S. faecium*) are resistant to DURICEF. It is not active against most strains of *enterobacter species*, *P. morganii*, and *P. vulgaris*. It has no activity against *Pseudomonas* or *Herella* species.

Disc Susceptibility Tests—Quantitative methods that require measurement of zone diameters give the most precise estimates of antibiotic susceptibility. One recommended procedure (CFR Section 460.1) uses cephalosporin class disc for testing susceptibility; interpretations correlate zone diameters of the disc test with MIC values for DURICEF. With this procedure, a report from the laboratory of "resistant" indicates that the infecting organism is not likely to respond to therapy. A report of "intermediate susceptibility" suggests that the organism would be susceptible if the infection is confined to the urinary tract, as DURICEF produces high antibiotic levels in the urine.

INDICATIONS: DURICEF (cefadroxil monohydrate) is indicated for the treatment of the following infections when caused by susceptible strains of the designated microorganisms:

Urinary tract infections caused by *E. coli*, *P. mirabilis*, and *Klebsiella* species
 Skin and skin structure infections caused by staphylococci and/or streptococci

Note—Culture and susceptibility tests should be initiated prior to and during therapy. Renal function studies should be performed when indicated.

CONTRAINDICATION: DURICEF (cefadroxil monohydrate) is contraindicated in patients with known allergy to the cephalosporin group of antibiotics.

WARNING: IN PENICILLIN-ALLERGIC PATIENTS, CEPHALOSPORIN ANTIBIOTICS SHOULD BE USED WITH GREAT CAUTION. THERE IS CLINICAL AND LABORATORY EVIDENCE OF PARTIAL CROSS-ALLERGENICITY OF THE PENICILLINS AND THE CEPHALOSPORINS, AND THERE ARE INSTANCES OF PATIENTS WHO HAVE HAD REACTIONS TO BOTH DRUGS (INCLUDING FATAL ANAPHYLAXIS AFTER PARENTERAL USE.)

Any patient who has demonstrated a history of some form of allergy, particularly to drugs, should receive antibiotics cautiously and then only when absolutely necessary. No exception should be made with regard to DURICEF (cefadroxil monohydrate).

PRECAUTIONS: Patients should be followed carefully so that any side-effects or unusual manifestations of drug idiosyncrasy may be detected. If a hypersensitivity reaction occurs, the drug should be discontinued and the patient treated with the usual agents (e.g., epinephrine or other pressor amines, antihistamines, or corticosteroids).

DURICEF (cefadroxil monohydrate) should be used with caution in the presence of markedly impaired renal function (creatinine clearance rate of less than 10 ml/min/1.73M²). (See Dosage and Administration.) In patients with known or suspected renal impairment, careful clinical observation and appropriate laboratory studies should be made prior to and during therapy.

Prolonged use of DURICEF may result in the overgrowth of nonsusceptible organisms. Careful observation of the patient is essential. If superinfection occurs during therapy, appropriate measures should be taken.

Positive direct Coombs tests have been reported during treatment with cephalosporin antibiotics. In hematologic studies or in transfusion cross-matching procedures when antiglobulin tests are performed on the minor side on Coombs testing of newborns whose mothers have received cephalosporin antibiotics before parturition, it should be recognized that a positive Coombs test may be due to the drug.

USAGE IN PREGNANCY: Although no teratogenic or anti-fertility effects were seen in reproductive studies in mice and rats receiving dosages greater than a normal human dose, the safety of this drug for use in human pregnancy has not been established. The benefits of the drug in pregnant women should be weighed against a possible risk to the fetus.

ADVERSE REACTIONS: Gastrointestinal—The most frequent side-effect has been nausea. It was infrequently severe enough to warrant cessation of therapy. Administration with food decreases nausea and does not decrease absorption. Diarrhea and dysuria have also occurred.

Hypersensitivity—Allergies (in the form of rash, urticaria, and angioedema) have been observed. These reactions usually subsided upon discontinuation of drug.

Other reactions have included genital pruritus, genital moniliasis, vaginitis, and moderate transient neutropenia.

DOSAGE AND ADMINISTRATION: DURICEF (cefadroxil monohydrate) is a stable and may be administered orally without regard to meals. Administration with food may be helpful in diminishing potential gastrointestinal complaints occasionally associated with oral cephalosporin therapy.

Adults—For urinary tract infections the usual adult dosage is one gm. (two 500 mg. capsules) two times per day. For skin and skin structure infections the usual dose is 500 mg. two times per day or 1 gm. once a day.

In patients with renal impairment, the dosage of cefadroxil should be adjusted according to creatinine clearance rates to prevent drug accumulation. The following schedule is suggested. In adults, the initial dose is 1 gm. of DURICEF (cefadroxil monohydrate) and the maintenance dose (based on the creatinine clearance rate [ml/min/1.73M²]) is 500 mg. at the time intervals listed below:

Creatinine Clearances	Dosage Interval
0-10 ml/min	36 hours
10-25 ml/min	24 hours
25-50 ml/min	12 hours

Patients with creatinine clearance rates over 50 ml/min may be treated as if they were patients having normal renal function.

Children—Dosage and safety have not yet been established in children.

HOW SUPPLIED: DURICEF® (cefadroxil monohydrate) capsules 500 mg. for oral administration in an opaque maroon cap and opaque white body No. 0 has gelatin capsule. On each half capsule printed in black is "MJ" and "500." Available in bottles of 24 capsules (NDC 0087-0784-41) and 100 capsules (NDC 0087-0784-42).

Case History

A 54-year-old white male was admitted for evaluation of bloating and weight-loss. In the six months prior to his admission, the patient lost 35 pounds, which he attributed to his bloating and early satiety. After eating, he experienced minimal epigastric pain without nausea or vomiting.

Physical examination was normal. There was no succussion splash. Abdominal radiographs were normal. Upper GI radiographs (Figures 1 and 2) demonstrate a narrowing of the second portion of the duodenum which appeared well epithelialized. There was no evidence of peptic disease; there was retained material in the stomach. Endoscopy revealed an area of narrowing, but no intrinsic bowel disease.

What is the differential diagnosis? What is your diagnosis?

Radiological Case of the Month

Case history on preceding page.

Diagnosis: Annular Pancreas

Discussion

At laparotomy, the impression of annular pancreas constricting the duodenum was confirmed. The lesion was bypassed and the patient had an excellent post-operative result.

Annular pancreas is a rare congenital anomaly apparently caused by a failure of fusion of the ventral and dorsal buds of the developing pancreas. The ventral bud develops independently and surrounds the second portion of the duodenum. A study of 20,000 autopsies at Johns Hopkins Hospital revealed only three cases of annular pancreas.¹

The degree of mechanical obstruction to the duodenum is variable, but, in the usual case, the duodenum is completely surrounded by a band of pancreatic tissue. Pancreatic tissue may sometimes infiltrate the muscularis propria of the duodenum. This is one of the few congenital anomalies of the gastrointestinal tract that often does not become apparent until adult life.² Diagnosis is made when significant symptoms are produced by a significant partial obstruction.

Annular pancreas first seen in the neonatal period is commonly associated with duodenal atresia and the radiographic findings are usually typical. Later in childhood, cases are detected because of a partial intermittent obstruction. Over 50% of cases are detected in the adult with a peak incidence in the fourth or fifth decades. It is twice as commonly found in the adult male than female.³ Concomitant peptic ulcer disease is reported in 30-40% of cases and pancreatitis in as many as 15-25%.⁴ The reason for the high incidence of pancreatitis is unknown, but may be related either to minor trauma or inadequate drainage of the ring of pancreatic tissue.⁵

The obstruction produced is often non-specific; however, there frequently will be a typical bandlike deformity of the second duodenum which is often somewhat eccentric. Differential diagnosis includes obstruction from duodenal ulcer alone, obstruction from pancreatitis, postoperative adhesions or duodenal carcinoma (usually has an "apple-core" appearance). Peritoneal or mucosal bands usually produce short constrictions. Extrinsic compression of the second portion of the duodenum has been reported in children by hyperplastic lymph nodes.

Doctors in the News

Dr. Posner Named

Dr. David B. Posner has been appointed head of Mercy Hospital's Division of Gastroenterology, according to an announcement by Sister Mary Thomas, RSM, President of the Hospital.

A graduate of the California Institute of Technology with a bachelor of science degree in chemistry, Dr. Posner received his Medical Degree from the University of Maryland School of Medicine and served his internship at Harbor General Hospital in Torrance, CA. He was a resident at the University of Maryland Hospital, where he earned a fellowship in gastroenterology.

An Assistant Professor of Medicine at the University of Maryland School of Medicine, Dr. Posner is certified by the American Board of Internal Medicine. He became eligible for certification by the American Board of Internal Medicine in Gastroenterology in 1978. He holds membership in the American Medical Association, American College of Physicians, American Gastroenterological Association, American Society for Gastrointestinal Endoscopy and

DR. POSNER

(Photo by Tadder, Baltimore.)

the American Association for the study of Liver Disease.

Locally, Dr. Posner belongs to the Baltimore City Medical Society and is a member of the Faculty. He and his family reside in Reisterstown.

Dr. Drucker Presents Stewart Memorial Lecture

William R. Drucker, MD, Professor and Chairman of the Department of Surgery at the University of Rochester, was the guest speaker at the St. Agnes Hospital Department of Surgery's eighth annual "Day of Surgery" Nov. 30th, and presented the **George A. Stewart Memorial Lecture** at St. Agnes in the Residence Building Auditorium on **Metabolic Basis for Therapy of Septic and Hemorrhagic Shock**.

Joining Dr. Drucker in an open forum panel discussion following the lecture were **Sheldon E. Greisman, MD**, Professor of Medicine and Physiology at the University of Maryland School of Medicine; **Andrew M. Munster, MD**, Associate Professor of Surgery at the Johns Hopkins Hospital School of Medicine and **Clayton G. Shatney, MD**, Chief of Surgery and Traumatology at the Maryland Institute for Emergency Medical Services of the University of Maryland.

In addition to his current position at the University of Rochester, Dr. Drucker has served as Professor of Surgery and Dean of the School of Medicine, as well as Chief of Staff at the University of Vir-

ginia Hospital, and Professor and Chairman of the Department of Surgery at the University of Toronto. At the Western Reserve University School of Medicine, Dr. Drucker was Instructor and Professor of Surgery.

Dr. Drucker received his Medical Degree from the Johns Hopkins Hospital, and completed his undergraduate work at Harvard College. □

Black Physicians and the Faculty:

Two Fine Portraits Added to the Faculty's Collection

At its meeting on Sept. 29, 1979, the Faculty Council formally accepted portraits of Daniel Coit Gilman and Reverdy M. Hall, MD. These two fine oil paintings join the Faculty's very valuable collection of portraits of individuals who were prominent in the history of the Faculty.

Daniel Coit Gilman (1831-1908) was an educator, not a physician. He is generally remembered as the creator of the American type of university because of his efforts in laying the foundation for the present University of California, and for his roles as the first President of the Johns Hopkins University. It is easily overlooked or forgotten that Gilman, in establishing the Medical School at Johns Hopkins, set the model which most then-existing medical schools tried to follow, and after which later medical schools were patterned. Through Dr. Gilman, Dr. William Welch was made the first Professor of Pathology at the Hopkins Medical School, followed by Dr. William Osler as Professor of Medicine, Dr. Howard Kelly as Professor of Gynecology and William Halsted as Professor of Surgery. The Medical and Chirurgical Faculty might be a different organization today were it not for the influence of these great physicians.

Dr. Gilman was a close friend of the Faculty. The **Transactions** of the Faculty during the late 1800s and early 1900s are full of references to him as he made meeting rooms available to the Faculty, gave testimony before various Faculty committees, etc. Dr. Gilman was a speaker at the Faculty's centennial anniversary in 1899 at the Hotel Rennett. He was also involved in many of the behind-the-scenes activities to raise funds for the present Faculty Building and meeting hall.

The portrait of Dr. Gilman was painted in 1900 by the prominent Baltimore artist Paul Hullwig. It hung for many years in the home of Dr. Curtis Burnam, who passed it on to his son-in-law, Dr. Howard C. Smith; it came to the Faculty through Dr. Smith's daughter, Mrs. Sally Miller.

Reverdy M. Hall, MD, was born in Baltimore in 1846. His parents were freed blacks who owned and farmed land in Anne Arundel County. He was sent to Bridgewater, MA for his early education and received his MD degree from Howard University in Washington, DC in 1872. He returned to Baltimore and set up practice. He was attending physician at Provident Hospital in Baltimore and later became Director of the Hospital. He was also the attending physician at the Industrial Home for Colored Girls in Melvale, MD. He was admitted to the Faculty in 1884 on the recommendation of Dr. Thomas Opie, becoming the second black physician to be so admitted. Dr. Hall died in 1917.

The portrait of Dr. Hall comes to the Faculty through the generosity of his granddaughter, Miss Edna Brown. It is the first portrait of a black physician to grace the halls of the Faculty Building.

The donation of the portrait of Reverdy M. Hall, MD to the Faculty raised a question in my mind about the history of the Faculty and black physicians.

The first source for answers to any question regarding the Faculty, at least before the year 1900, is always Dr. Eugene Cordell's **Medical Annals of Maryland, 1799-1899**. In the index of that book, under the term "Colored Physicians," there are two references. The first is to the chronology, which for the year 1882 has the following paragraph:

"The first colored physician was admitted this year, Whitfield Winsey, MD, of Baltimore, a graduate of Harvard University, having that honor. Dr. Winsey had been previously rejected by a local society in East Baltimore, where he resided, and he must have felt fully compensated for his previous disappointment in the unanimous recommendation of the Board of Examiners and the unanimous election of the Faculty. Two other physicians of color have since been added to the membership. In a society such as this, representing the entire State and designed for purely scientific and ethical purposes, there should be no requirements other than those of character and attainment."

•

These words are especially significant because they referred to a time less than 20 years after the end of the American Civil War and the abolition of slavery, and because these events occurred in a society consisting of a large number of members who had served as soldiers in the Confederate Army. Dr. Cordell, himself, had been a Confederate soldier.

Cordell's index also refers to the biographical section about Whitfield Winsey, MD. No other information on the topic is given in Cordell, nor does the book identify the additional two black physicians admitted during this period.

During my seven years of acquaintance with the Faculty, I had come across the above passage in Cordell several times, making me curious as to who the additional physicians were. I had also long suspected that there was more to the story. Additional light on the subject came in 1978 from Ms. Una Corbett, who was doing research on black physicians in Maryland and used the Faculty Library. From Ms. Corbett came the name of Reverdy M. Hall, MD as the second black physician admitted to the Faculty. Having the name, I could easily check Cordell to determine that Dr. Hall was indeed a member of the Faculty, but there is nothing there to indicate positively that he was the second black physician admitted. The third physician mentioned by Cordell remained nameless.

The last piece of this puzzle fell into place when, a couple of months ago, I was reading through the **Transactions** of the Faculty, searching for information

about the Anne Arundel County Medical Society, and came across the Trimble lecture for the year 1927, given by Randolph Winslow, MD. Entitled **Recollections of 50 Years of the Medical and Chirurgical Faculty**, Dr. Winslow's talk contained several interesting tidbits of Faculty history, and there was one paragraph specifically about Negro physicians:

"In 10 years the membership remained almost stationary. Three physicians of negro extraction were elected members, which caused such dissatisfaction that some of our valued associates handed in their resignations. Dr. Whitfield Winsey was a very blond man, whom no one would suspect of having negro blood, but he never claimed to be otherwise. He was a graduate of Harvard Medical School and was a very reputable man. Dr. Reverdy M. Hall would also have passed for a white man, while Dr. William H. Thompson was an unmistakable negro. The arrangement was not satisfactory, and no others of the colored race have been elected since."

Dr. Winslow's lecture, while providing the name of the third black physician admitted to the Faculty in the 1880s, raised more questions than it answered. I was left curious, wondering about the debate that must have accompanied the admission of these black physicians to the Faculty, and also what the role was of these black physicians in the activities of the Faculty. I was also curious as to whether no other black physicians applied for membership in the Faculty after this time or there were applications that were turned down. Answers to all these questions are slow in coming; however, I have uncovered several items by studying the Faculty's **Transactions** and other records. Dr. Whitfield Winsey was presented for membership by the unanimous recommendation of the Board of Examiners for the Western Shore on Apr. 11, 1882, and he was admitted to membership by unanimous vote of the Faculty on the next day. Dr. Winsey immediately became very active in Faculty affairs, serving on many committees and regularly presenting papers at the Annual Meetings of the Faculty.

Dr. Reverdy M. Hall was proposed for membership in the Faculty by Dr. Thomas Opie in 1884 and was elected that same year. Dr. Hall served on the Faculty Council as a delegate from the Clinical Society, a smaller medical society in Baltimore.

Dr. William H. Thompson was proposed for membership by the Western Shore Examining Board in 1887 and was unanimously elected.

The actual discussions about the admissions of these three black physicians to the Faculty and the resignations by prominent members because of their admission are matters that require further study, but several events briefly mentioned in the **Transactions** may be clues.

In 1881, it was pointed out that the Faculty's bylaws included no provision for resignations; this matter was studied and changed. At the 1882 Annual Meeting, several physicians resigned from the Faculty, but this occurred before Dr. Whitfield Winsey's name was proposed for membership. In 1884, shortly after Dr. Reverdy M. Hall's admission to the Faculty, J. Edwin Michael, MD announced his intention to propose a motion at the next Annual Meeting to change the Faculty's constitution and bylaws so that the words "gentleman"

Count on Kelly Health Care for exactly the nurse you need.

For staff supplement or in-home patient care, Kelly Health Care should be your choice for the exacting assignments. Tell us about the ideal RN, LPN, Aide or Home Health Aide for high-skills duty or special patient problems. We'll get her for your patient—or decline the assignment. and "gentlemen" would be replaced by "person" and "persons." This resolution was presented and adopted at the 1885 meeting. I am curious as to whether Dr. Michael proposed this resolution because the Faculty was now admitting black physicians or whether it was to open the way for the admission in 1886 of Amanda Taylor Norris, MD, to the Faculty. I believe she was the first female physician admitted by the Faculty.

My research seems to confirm Cordell's statement in his *Annals* that these three black physicians were the only blacks admitted to the Faculty prior to 1900; however, there seems to be some discrepancy with Dr. Winslow's statement in his 1927 Trimble address that "No others of the colored race have been admitted since."

John Ruhräh, MD spent much of his later life editing and compiling a second volume to Cordell's *Annals* that was to cover the history of the Faculty between the years 1900-25. As yet, this volume has not been published, except for some segments that have appeared recently in the *Journal*. As part of his research, Ruhräh compiled biographical information about all Faculty members who practiced in Maryland during this period. An initial examination of the more than 2,000 biographies in Ruhräh's work shows that approximately 40 of the biographies are of black physicians. Since Ruhräh was doing his work during the early 1930s, and Randolph Winslow's speech was in 1927, it seems unlikely that all these black physicians would have been admitted to the Faculty during the short time between those years. One suspects that Ruhräh attempted to include all physicians, not just Faculty members. This interpretation is further strengthened by a comment made by Dr. Winslow at a 1932 meeting of the Faculty Council. The body was discussing a request for admission received from a black physician in Silver Spring when Dr. Winslow stated that it was not the policy of the Faculty to admit colored physicians. The membership application was sent to the Montgomery County Medical Society for action.

By the late 1930s, the question of black membership in the Faculty had reached significant proportions. The American Medical Association readily admitted blacks, but maintained their rule that admission to the national association depended on admission to a state society, which, in turn, depended upon admission to county or local societies. There were, in fact, black members of the AMA from as far back as 1900.

In 1939, the AMA as a result of negotiations with the National Medical Association, reaffirmed its willingness to admit black physicians and also agreed to remove the discriminatory term "colored" after the names of black physicians listed in the AMA *Directory*.

That same year, George McDonald, MD, President of the Maryland Medical, Dental and Pharmaceutical Association's Medical Section—which represented black physicians in Maryland—addressed a letter to the Faculty Council. This letter first of all addressed generally the health problems of the Negro citizens of Baltimore and the state, who comprised one-seventh of the population. The letter went on to point out that the Negro physician, after graduating from an approved medical school, serving an approved internship and, in many instances, an approved residency, entered into

private practice and then found the avenues to further professional advancement closed to him. In Maryland the doors to postgraduate instruction, clinics, hospitals and—to quote Dr. McDonald, "worst of all"—the official medical library of the state were not open to him. Black physicians were not even allowed to listen in on the discussion of current medical problems by those people who had the advantage of using all the medical facilities of the city and state.

The letter further commented on the AMA's reaffirmation that there was no official barrier to Negro physicians in that organization, provided they were accepted into membership in their respective local societies. It was further pointed out that in many northern states there was no problem, and that several southern states, especially Texas, were seriously working on the dilemma. The letter concluded by asking the Council to consider the admission of fully qualified Negro physicians to scientific membership in the society or an arrangement of affiliation between the two societies that would give fully qualified Negro physicians membership in the AMA, and also to appoint a committee from the Faculty to meet with a similar committee from the black society to work out means to solve the problems.

As a result of Dr. McDonald's letter, a committee was formed under the chairmanship of George Finney, MD. In 1940, this committee submitted two recommendations to the House of Delegates: first, to allow members in good standing with the "Negro State Medical Society" to use the Faculty Library and, secondly, to allow them to attend scientific sessions in Osler Hall. The House of Delegates of the Faculty adopted these two provisions on Apr. 23, 1940. Shortly thereafter, the Baltimore City Medical Society passed a resolution extending to the members of the Monumental Medical Society (the Baltimore City society for black physicians) "The privilege of attending any medical or scientific session of the Baltimore City Medical Society which may be held in Osler Hall;" however, the resolution went on to state that "This motion is not to be construed as inferring any other privileges of membership either active or associate than those extended by the House of Delegates of the Medical and Chirurgical Faculty."

As a result of this action, about 40 or 50 black physicians were sent copies of the Faculty's *Bulletin* and given Library privileges. Most of these physicians were from Baltimore City, though a few came from the counties. A fee of \$3 per year was charged to these physicians to cover the cost of library privileges. A letter went out to the black physicians in the counties reminding them that they were entitled to request and borrow Library materials through the mail, with the Library paying the cost. In looking through the records and the names of the black physicians who year after year paid their \$3, I found that there was active use of the Faculty Library by this group.

The coming of World War II seems to have intervened in any further progress on the problem, but following the coming of peace, the issue was promptly revived. It is interesting that although only seven to eight years had passed, much effort had to be devoted to "reinventing the wheel," that is, to redetermining that which had already been determined.

This time, the impetus came from Anne Arundel County. In 1947, Dr. Theodore H. Johnson, a black Annapolis physician, requested admission to the Anne Arundel County Medical Society. Dr. Johnson had applied for hospital privileges on the staff of the Annapolis Emergency Hospital (now the Anne Arundel General Hospital), but these privileges were refused on the grounds that Dr. Johnson was not a member of the state medical society. In response, Dr. Johnson applied for membership in the Faculty.

The problem had deeper roots and presented the Faculty with an almost impossible dilemma. Dr. Johnson was running a small obstetrics hospital in Annapolis for black patients. The Maryland State Health Department recognized that Dr. Johnson's hospital was very fine, in spite of having only limited resources. Although it could comply with applicable Health Department regulations, the hospital could not be licensed because it was too small. Accordingly, the Health Department ruled that the hospital had to be closed, but it refrained from taking this action because the Emergency Hospital in Annapolis would not yet admit colored obstetrics patients. At the time, Dr. Johnson's maternity hospital was the only hospital in Anne Arundel County accepting black obstetrics patients, and so, although the Health Department refused to license the hospital, they could not close it.

An interesting side note is that up until 1952 black physicians were excluded from the medical staff of the Annapolis Emergency Hospital, even though one of the founders of the hospital in 1902 had been Dr. William Bishop, who had been born as a slave in Annapolis in 1849.

The Faculty's response to Dr. Johnson's application was to refer him to the Anne Arundel Medical Society. At the same time, the Secretary of the county society was informed that it was up to each component society to set the qualifications of prospective members. In effect, the officers of the Faculty were stating that they would accept black members if they were first admitted to a component society. Dr. Johnson's application for membership was evidently rejected, as were subsequent applications by three additional black physicians in Anne Arundel County.

Not only Anne Arundel County had to face the issue; in 1947 Charles County and Dorchester County also received applications from black physicians for membership. In each case a black physician, after applying for admission privileges at a local hospital, had been told that he first had to be a member of the county and state medical societies. As a result of these applications, the Faculty's secretary wrote to the AMA asking for a statement. His letter illustrates how the problem was seen from both sides:

"It seems fitting that the Negro not be denied educational advantages and postgraduate advancement, but in the South it is difficult to find a way to arrange this without causing a certain social embarrassment, particularly inasmuch as in many counties the meetings are held in the physicians' homes and many of the other meetings are dinner meetings."

Again a committee was formed to study the issue of membership for colored physicians in the Faculty and component medical societies. This time the committee

The MPP Nurse. A Special Person.

All the nurses who work for Medical Personnel Pool are special. What makes them so special? Being a skilled professional and being associated with other professionals with extremely high standards of excellence. Knowing their skills will be fully utilized by MPP staff's careful assignment matching. And also, very importantly, by being able to devote as much time to their nursing career as they wish without sacrificing their personal lives.

MPP's concept of flexible scheduling allows our employees to work as many hours as they wish or as little on the days and weeks convenient to their individual schedule. Everyone benefits as valuable nursing skills which would otherwise be lost are being provided for patient care.

A flexible schedule is only one of the many benefits that await you when you work for Medical Personnel Pool, one of the most highly respected nursing services in its field. Choice of assignments, extensive insurance coverage including professional and general liability and worker's compensation insurances, in-service education, competitive salary, and a reputation for high standards are just a few of the others.

To learn more about the many opportunities awaiting you at Medical Personnel Pool, stop by your local MPP office.

Metro

was under the chairmanship of Dr. John M. T. Finney, Jr. The first report of this committee was presented to the Faculty's Council and House of Delegates on Oct. 14, 1948. The committee had five recommendations: 1) All purely professional privileges and membership in the Medical and Chirurgical Faculty of Maryland and its

constituent societies should be opened to acceptable Negro doctors by the prescribed method of election to that society. 2) These privileges and membership should not extend to purely social functions. 3) No funds of the Faculty or its component societies should be expended for any social function; all expenditures of society funds should be limited to strictly professional matters. 4) The Faculty and each component society should appoint a standing committee known as the Entertainment Committee, whose duty would be to arrange for social functions in connection with any meeting and to arrange for payment thereof outside the funds of the society. 5) The question of membership on any hospital staff is entirely a matter for decision by proper authorities of that individual hospital.

From the correspondence that was generated around this committee and its activities, it seems obvious that there was little doubt that the professional requests from the black physicians were justified. It appears that the major concern was the social embarrassment that would result from the possible participation of blacks in the Faculty's social functions. The second and third recommendations were felt necessary to assure that there would be no complaint from the black physicians after they became members that their dues were being used for functions which they could not attend. A curious sidelight of Dr. Finney's committee's reports is the fact that the committee held its meetings at the Maryland Club, where no black would have been welcome except as a waiter or doorman.

The report to the House of Delegates elicited considerable discussion. It is known that Dr. Huntington Williams, Dr. Shipley and Dr. Bird all argued in favor of the motion to accept it, presenting examples of past professional cooperation with colored physicians that did not cause any social embarrassment. Dr. Bird urged that the state association was obliged to help colored physicians to the limit of its ability. Dr. Finney's committee's report was accepted by the House of Delegates with appreciation. A new committee was appointed to further study the problem, and the delegates were asked to discuss the problem with their component societies so that this new committee could evaluate the opinions of the component societies and report back to the House of Delegates.

Early in 1949, a letter was sent to the president and secretary of each component society, along with a copy of the report of the committee. Each component society was asked to indicate the consensus of their membership regarding two questions: 1) Should colored physicians be granted membership? and 2) If such a privilege is granted, should professional and social functions be disassociated? Dr. Finney, chairman of the previous committee, was also chairman of the new special committee to study the problem, and it was his task to compile and evaluate the results of the questionnaire. When the results were tabulated, 10 county societies voted unanimously to grant black physicians membership in the Faculty and component societies; however, most indicated that the social functions should be kept separate. Three component societies had divided votes, two with the majority opposed to admitting black physicians, and one with the majority in favor of black physicians. Seven county societies were unanimously opposed to granting black physicians membership; two

counties tabled the matter with no expression of feeling and one county did not reply. It is interesting that the special committee was able to tabulate the results in a way that indicated a tie with 11 component societies favorable and 11 unfavorable, with one not replying.

As I examined the record, it appeared quite probable that, had the latter county replied, its vote would have been unfavorable, but then the committee could still have managed to work a tie out of the results by counting Allegany and Garrett Counties in favor, as two separate votes rather than one; these two counties had a joint medical society at the time.

About this time, somebody must have looked into the **Transactions** of the Faculty, for Dr. Finney introduced as new evidence the fact that the concept of admitting black physicians to the medical society was not a new question or a revolutionary idea. Dr. Finney seemed almost delighted to report that in the 1880s the Faculty admitted at least three colored members, one of whom took a quite active part in its meetings and contributed several papers. To quote the conclusion of Dr. Finney's report:

"How many other members there may have been or over what period of years or any reasons for discontinuance of such memberships cannot be ascertained. The fact remains, there have been colored members of the Faculty in the past."

•

On Apr. 19, 1949, Dr. Finney presented the special committee's report to the House of Delegates; this report states that "Negro physicians and surgeons, who professionally meet the requirements for membership in the component City and County Societies of the Faculty should be accorded such membership by due election to same." The report goes on, however, "It should remain, as always, the prerogative of each individual component society to determine their own standards for eligibility for election, however. The committee simply urges for their consideration the justice of such professional recognition for all of our fellow practitioners."

The report goes on to point out that membership in the AMA depends on membership in one's state society, which, in turn, is dependent on election to a component city or county society. Again quoting from the report: "It would seem hardly fair to ask or expect one whole group to conform to principles of ethics and practice laid down by an organization and its component state parts in which they have neither membership nor representation." The committee's report then goes on to show that the admission of black physicians to the Faculty and its component parts is of vital interest to the patient, the profession, the community and the country as a whole. The committee stated in conclusion that it was not unmindful of the problems which would attend such a course of action; however, rather than following the line of carefully distinguishing social and professional activities, the committee merely stated that it might be necessary to make certain departures from, and rearrangements of, accustomed methods of holding and handling meetings, at both the state and local levels. The committee felt that such obstacles were not insurmountable at either city or county level, as well as at the state level of the Faculty.

The committee's report was accepted and the matter was settled, at least on the state level. In August, 1949, black physicians in Baltimore City were notified that they were eligible for membership in the city society and that by joining it would no longer be required to pay \$3 a year to use the Faculty Library. After this time letters addressed to the Faculty from component societies regarding black physicians were answered with a statement that the qualifications for the admission for a black physician to the Faculty were to be the same as for white physicians.

It seems that shortly thereafter, perhaps around the year 1950, the members of the black Maryland Medical Society joined the Faculty in a body through the Baltimore City Medical Society. By 1953, there were 45 black physicians in the Medical Society—13 from the counties and 32 in the city. Happily, Dr. Theodore Johnson in Anne Arundel County, whose request for membership in the Faculty in 1947 had initiated all this activity, was one of the first of the black physicians to be admitted to the Anne Arundel County Medical Society and to receive privileges to practice at the Annapolis Emergency Hospital.

The social problems anticipated by the committee were quick to surface. While the Faculty members were willing to include black physicians at their scientific meetings, and even at social functions, the hotels and restaurants where the Faculty and its component societies frequently held their meetings were not. For a while, the Faculty tried sending invitations for social functions to black physicians only when it was known that they would be admitted. This became very difficult, especially because the Baltimore City Medical Society, which had the largest black membership, followed the guidelines very strictly and did not indicate on its membership records in any way the race of the member. Thus, in 1953, it was decided to hold the meal functions for the Faculty's annual meetings at the Faculty building. This practice was followed until about 1958, when some of the Baltimore City hotels agreed to let black physicians join with other physicians at Faculty functions, as long as these were private functions. There continued to be a problem, however, for Faculty meetings held away from Baltimore City and out-of-state.

In 1962, the House of Delegates of the Faculty passed a resolution urging the rapid integration of medical schools, internships, residencies and hospital staff privileges. The resolution pointed out the many assaults upon the medical profession then being mustered and emphasized the importance of presenting a united front. The resolution presented the total integration of the medical profession as essential for the health and well-being of the people of the country and the strength of the medical profession.

In 1963 and 1964, the Baltimore County Medical Society presented resolutions that would have prevented the Faculty from holding a meeting at any facility where blacks would not be allowed to participate equally. The resolutions were tabled both times, and it appears that the civil rights laws forbidding segregation in restaurants and hotels overtook the Faculty and solved the problem first.

This is obviously not the total story of black physicians and medicine in Maryland. I have said nothing

Dulaney-Towson NURSING AND CONVALESCENT HOME

Professionally directed Medical Care
Program for the chronically ill, convalescent,
post-operative, disabled, or the elderly.

- Complete professional care—including registered physical therapist and 24 hour Nursing supervision that surpasses state requirements.
- Modern, spacious rooms, facilities and entertainment areas.
- Full privileges for Personal Physicians.
- Open visiting hours—see your loved one when you want to.

about the several black medical schools that existed in Maryland, especially around the turn of the Century, and nothing about the many hospitals for blacks that existed in Baltimore City. There is evidence that black physicians were scattered throughout the state of Maryland, even though the majority were in Baltimore City, and most of the activities for black physicians centered in Baltimore City. During the 1930s, there were a large number of different medical societies for blacks, all of them somehow interconnected; the minutes and proceedings from those societies would make a fascinating study in themselves.

Most of the research for this paper was based on minutes and summaries of meetings. Because of the nature of these documents, they usually only hint at what was going on behind the scenes. While some may be quick to harshly judge the Faculty in this matter, I think it should be pointed out that at no time and in no place did the Faculty take an official position refusing to admit black physicians. Furthermore, there is evidence that there were many prominent physicians, most of them officers in the Faculty, who were working for the rights of black physicians and trying hard to have them admitted to the component societies and the Faculty itself in a manner that would leave the Faculty stronger because of these activities. There were two reasons for admitting blacks to the state medical society: first and foremost, of course, was the justice of their request, and second was the need for organized medicine to represent all physicians. When black physicians were admitted to the Faculty, it was because they were accepted and endorsed by their county societies. Had the admission of black physicians to the component societies been

dictated by the Faculty, the resignations and protests of Faculty members that would have resulted would have left the Faculty weaker and more divided, and even less representative of the medical profession.

In searching out the facts behind this history, I saw that the leaders of the Faculty were in the midst of a storm of impossible dilemmas. Charting the Faculty's course through this storm was a delicate task, calling for the greatest diplomacy, tact and firmness. The success of Dr. George Finney and Dr. John M. T. Finney, Jr. in accomplishing this most difficult task is due much more recognition that has previously been granted.

Schoolboy Wrestler Suffers From Too Rapid Weight-Loss

Sports medicine experts have long been aware of potential health hazards to the schoolboy boxer or wrestler who must "make the weight" for a match by losing pounds rapidly.

The contestant who has grown several pounds above his weight class must either lose the extra weight or compete in the next higher class with athletes who may be considerably larger.

Sweating is the most prevalent means, and food and fluid restriction are used. Diuretics to rid the body of fluids by excessive urination also are utilized. Several important changes occur in the body. There is a decrease in muscle strength, plasma volume, heart output, blood flow through the kidneys and other body functions.

The athlete may suffer fever, nausea and weakness, and most likely will not perform at maximum capability. Usually, the physical damage is not permanent and body strength is restored with the regain-

ing of the pounds, but sometimes there are more serious, even life-threatening, hazards.

Philip H. Croyle, MD of St. Joseph Hospital, Denver, and colleagues reported in a recent issue of the **Journal of the American Medical Association (JAMA)** on a 16-year-old high school wrestler who suffered a massive blood clot in the lung as a result of excessive rapid weight-loss. Bypass chest surgery saved his life.

The athlete, who weighed 109 pounds, underwent rapid dehydration twice in one week, losing a total of 13 pounds, or 12% of his entire body weight. This brought on a condition in which a minor bruise suffered during the wrestling bout triggered a sizable blood clot. The clot blocked a lung. Post-operative recovery was smooth and the wrestler was well 18 months later, Dr. Croyle says.

The patient's youth and good physical condition sustained him for some time, but his condition finally deteriorated to such a precarious state that surgery was necessary.

Dr. Croyle concludes: "Athletes must avoid rapid weight loss before competition."

To make matters even worse, he was defeated in his match by an opponent he had handily beaten before. In weakened condition, his strength and skill were drastically reduced. □

Librium®

chlordiazepoxide HCl/Roche

- ☐ Proven antianxiety performance
- ☐ An unsurpassed safety record
- ☐ Predictable patient response
- ☐ Minimal effect on mental acuity at recommended doses
- ☐ Minimal interference with many primary medications, such as antacids, anticholinergics, diuretics, cardiac glycosides and antihypertensive agents

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of anxiety and tension occurring alone or accompanying various disease states. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and

acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. Oral—Adults: Mild and moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl) Capsules, 5 mg, 10 mg and 25 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in trays of 4 reverse-numbered boxes of 25, and in boxes containing 10 strips of 10; Prescription Paks of 50, available singly and in trays of 10. Libritabs® (chlordiazepoxide) Tablets, 5 mg, 10 mg and 25 mg—bottles of 100 and 500. With respect to clinical activity, capsules and tablets are indistinguishable.
